Starting from the formalism of force-correlation functions the electrical resistivity R, the thermoelectric power S and the Hall coefficient R_H are calculated for a system containing electron-libron scattering. In the framework of a two-band model these transport quantities can be calculated in the case of weak scattering and high temperatures. The results obtained for R, S and R_H are compared qualitatively with measurements on TTF-TCNQ. (22 refs.)

102364 Effect of defects on phase transitions in tetraselenotetracene chloride, $(TSeT)_2Cl$. P.A.Kononovich, V.N.Laukhin, S.I.Pesotskii, I.F.Shchegolev, A.G.Khomenko (Inst. of Chem. Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.92-6 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.77-9 (20 Jan. 1983).
High-quality single crystals of the organometallic compounds $(TSeT)_2Cl$ have been synthesized. The metal-semimetal phase transition in these samples has several new features. (10 refs.)

102365 One-dimensionality in glassy carbon. D.F.Baker, R.H.Bragg (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2219-21 (15 Aug. 1983).
A negative $T^{-1/2}$ dependence of a component of the electrical conductivity, indicative of one-dimensional transport, was found in glassy carbon heat treated at temperatures less than 2200°C. The microstructure, as examined in lattice images in the transmission electron microscope, the Porod-law dependence obtained in small-angle scattering, and the decrease in the d_{002}-spacing interlayer as measured by X-ray diffraction (above this critical temperature) support this thesis. (38 refs.)

102366 Fluctuations of the relaxation time in one-dimensional systems. L.V.Chebotarev (Kharkov State Univ., Kharkov, USSR).
Solid State Commun. (USA), vol.47, no.7, p.549-53 (Aug. 1983).
The direct interaction of electrons with impurity field is represented as an interelectronic interaction of a special kind which is called 'dissipative'. This type of interaction is responsible for the relaxation process and generally leads to fluctuations of the relaxation time. The probability distribution function for the mean free time of electrons is found in the white-noise approximation for a one-dimensional conductor. It is shown that the dielectric response function can be obtained in this case by averaging the relevant expression over the fluctuations of the relaxation time. (8 refs.)

102367 AC-field induced steps in the I-V characteristics of charge density wave transport. E.Ben-Jacob (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Solid State Commun. (USA), vol.47, no.8, p.603-6 (Aug. 1983).
The author makes further predictions on the response of the charge density wave (CDW), based on the classical model and including an inertia term. Showing the analogy of the latter with the Stewart-McCumber (RSJ) model for Josephson junctions, he predicts the appearance of Shapiro-like steps in the I-V characteristics of the CDW in the presence of an AC field. The predictions are presented in a form suitable for direct comparison with experiment. (32 refs.)

102368 Electrical conductivity of doped poly(1-methyl 2,5-pyrrolylene). P.Kovacic, I.Khoury (Dept. of Chem., Univ. of Wisconsin, Milwaukee, WI, USA), R.L.Elsenbaumer.
Synth. Met. (Switzerland), vol.6, no.1, p.31-8 (June 1983).
Poly(1-methyl 2,5-pyrrolylene) was synthesized by coupling of the Grignard reagent of 1-methyl 2,5-dibromopyrrole with $Ni(AcAc)_2$ catalyst. Conductivities of the doped polymers lie in the range, 10^{-}-10^{-6} ohm^{-1} cm^{-1}. The effect of several polymerization variables on conductivity was determined. The doped material is stable in air for at least 2 months, and the parent polymer is moldable and solution processable. Rationalizations are presented for conductivity in relation to polymer structure. (37 refs.)

102369 Basic issues in electronic conduction in amorphous semiconductors. II. Electronic transport properties. D.Emin (Sandia Nat. Labs., Albuquerque, NM, USA).
Comments Solid State Phys. (GB), vol.11, no.2, p.59-72 (1983).
For pt.I see ibid., vol.11, p.35 (1983). In crystals, charge carriers generally either self-trap to form small polarons or remain quasifree. In amorphous semiconductors this dichotomy is somewhat modified. None the less, the densities-of-state of these two situations differ qualitatively from one another. In the quasifree (Mott-CFO) model excess charges either move in extended states as quasifree (high-mobility) carriers or reside in localized states within the bandtails. Charges in the bandtails may move directly between localized states via phonon-assisted hopping. In the small-polaron picture the self-trapped carriers move between severely localized states via multiphonon-assisted hopping. The author addresses steady-state transport properties of these two models. In particular, the general principles of phonon-assisted transitions are described and applied to bandtail and small-polaron hopping motion. Then the Peltier heat, obtained in a Seebeck effect (thermoelectric power) measurement, and the Hall effect are discussed. Analysis of these basic transport measurements in the chalcogenide glasses implies that the small-polaron picture is applicable there. (33 refs.)

102370 Dispersive transport from negatively correlated defect centers. B.A.Khan, D.Adler (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.81-9 (Aug. 1983).
The transient current response arising from time-of-flight experiments on a material whose trapping levels are predominantly associated with a well-defined negatively correlated defect is calculated. The resulting behavior is controlled by the relative magnitude of two characteristic times, the transit time, τ_1 and the time necessary for interconversion of a neutral acceptor to a neutral donor τ. If $\tau_t<\tau$, nondispersive transport results. In contrast, if $\tau_t>\tau$, two kinks characterize $I(t)$. The current is initially independent of time, but eventually becomes dispersive, decaying as $t^{-1/2}$ prior to τ_t and as $t^{-3/2}$ afterwards. The dispersion results from the spread of times necessary to interconvert the neutral defects. (14 refs.)

102371 The Monte Carlo method for the solution of charge transport in semiconductors with applications to covalent materials. C.Jacoboni, L.Reggiani (Istituto di Fisica, Univ. di Modena, Modena, Italy).
Rev. Mod. Phys. (USA), vol.55, no.3, p.645-705 (July 1983).
This review presents in a comprehensive and tutorial form the basic principles of the Monte Carlo method, as applied to the solution of transport problems in semiconductors. Sufficient details of a typical Monte Carlo simulation have been given to allow the interested reader to create his own Monte Carlo program, and the method has been briefly compared with alternative theoretical techniques. Applications have been limited to the case of covalent semiconductors. Particular attention has been paid to the evaluation of the limited to the case of covalent semiconductors. Particular attention has been paid to the evaluation of the integrated scattering probabilities, for which final expressions are given in a form suitable for their direct use. A collection of results obtained with Monte Carlo simulations is presented, with the aim of showing the power of the method in obtaining physical insights into the processes under investigation. Special technical aspects of the method and updated microscopic models have been treated in some appendixes. (177 refs.)

102373 On the exact calculation of the specific electrical conductivity of semiconducting slabs. P.Debreceni, I.Kirschner, M.F.Kotkata, G.Kovacs, T.Porjesz (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.361-70 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
A model is proposed for the exact calculation of the specific electrical conductivity of a semiconuducting slab between two circular metallic electrodes. The assumed mixed boundary conditions and the derived dual integral equations lead to a Fredholm integral equation of the second type for infinite slabs. The latter is solved numerically and the results are discussed in terms of a correction function plotted against the ratio of the slab thickness to the electrode radius in the range of 0.01-10. A resistor network has been used to verify the calculations. A good agreement has been found with previously published results in some range of thickness-radius function. (13 refs.)

102374 Electronic conduction in lead oxides and at metal/oxide interfaces. A.Lemaigre, P.Mirebeau, M.Chemla (Univ. Pierre et Marie Curie, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1151-6 (25 April 1983). In French.
The electrical resistivity of polycrystalline α and β PbO_2 is near 10^{-3} and 10^{-4} Ω.cm respectively. Also, the contact resistance of these oxides with gold is only 10^{-2} Ω.cm^2. However, the junction Pb/PbO_2 has the appearance of a barrier whose resistivity is more than 1 Ω.cm^2, which is attributed to the formation of a lower oxide at the interface. In the presence of acid, the conductance of this junction is increased by a factor of 20, which may be due to the doping of the oxide by protons. (12 refs.)

102375 Determination of the equilibrium $US_{2\alpha} \rightleftarrows US_{2\beta}$ and variations of the electrical properties of these two sulfides as function of sulfur pressure between 600 and 1000°C. D.Carton, A.Dybantsa (Lab. des Materiaux Semiconducteurs, UER Sci. Exacte Naturelles, Amiens, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1493-6 (30 May 1983). In French.
The variations of electrical conductivity and thermoelectric power of $US_{2\alpha}$ and $US_{2\beta}$ as functions of sulfur pressure and temperature enable the authors to determine the equilibrium between the two phases. $US_{2\alpha}$ is an electronic semiconductor of pure n type whereas $US_{2\beta}$ is also an electronic semiconductor but exhibiting a p-n transition. (13 refs.)

102376 Modeling of carrier mobility against carrier concentration in arsenic-, phosphorus-, and boron-doped silicon. G.Masetti (Dept. of Electronics, Univ. of Ancona, Ancona, Italy), M.Severi, S.Solmi.
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.764-9 (July 1983).
New carrier mobility data for both arsenic- and boron-doped silicon are presented in the high doping range. The data definitely show that the electron mobility in As-doped silicon is significantly lower than in P-doped silicon for carrier concentrations higher than 10^{19} cm^{-3}. By integrating these data with those previously published, empirical relationships able to model the carrier mobility against carrier concentration in the whole experimental range examined to date (about eight decades in concentration) for As-, P-, and B-doped silicon are derived. Different parameters in the expression for the n-type dopants provide differentiation between the electron mobility in As- and P-doped silicon. Finally, it is shown that these new expressions, once implemented in the SUPREM II process simulator, lead to reduced errors in the simulation of the sheet resistance values. (25 refs.)

102377 Resistivity and mobility of GaP at 300K. Y.C.Kao, O.Eknoyan (Electrical Engng. Dept., Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.855-7 (July 1983).
Resistivity and mobility data of GaP at 300K are presented in a unified form as a function of impurity concentration for the first time. The data are determined from sheet Hall coefficient and resistivity measurements obtained using the van der Pauw method. The results are given over a wide range of concentrations ranging from unitentionally doped to degenerate conditions. The maximum values of the electron and hole mobility, μ_n, and μ_p, are found to be 160 and 135 cm^2/V.s, respectively. (11 refs.)

102378 The DC conductivity of polyphenylacetylene below room temperature. A.P.Bhatt, W.A.Anderson (Dept. of Electrical & Computer Engng., State Univ. of New York, Amherst, NY, USA), E.T.Kang, P.Ehrlich.
J. Appl. Phys. (USA), vol.54, no.7, p.3973-6 (July 1983).
The temperature dependence of the DC conductivity for doped and undoped cispolyphenylacetylene (PPA) is analyzed at temperatures of 110 to 300K. The DC conductivity (σ_{DC}) data of arsenic pentafluoride-doped and iodine-doped samples suggest two major current conduction processes separated by a characteristic temperature (T_c) of about 257K, which is independent of the doping level. At $T<T_c$, σ_{DC} is independent of the temperature within experimental error. At $T>T_c$, σ_{DC} is activated with an activation energy that, for PPA-AsF_5, varies from 0.86 eV to 0.51 eV for doping levels of 2×10^{-3} to 7×10^{-2} moles dopant/moles monomer, respectively. PPA annealed at 130°C, which is known to undergo isomerization and cyclization reactions, has a T_c of about 210K, and σ_{DC} does not respond to doping. Possible conduction mechanisms are discussed. (17 refs.)

102379 Effect of molecular rotation upon charge transport between disordered carbazole units. J.H.Slowik, I.Chen (Xerox Webster Res. Center, Webster, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4467-73 (Aug. 1983).
A calculation of intermolecular transfer integrals J for carbazole molecules shows that J varies by orders of magnitude when the molecular planes are rotated. The angular variation of J is used to estimate the corresponding changes in the transition rates. It is suggested that in certain cases the electronic transition occurs after thermally activated hindered rotation. Furthermore, the rotational energy barrier may be a principal component of the rather large electronic transport activation energy which is observed experimentally when carriers move by hopping in certain amorphous organic materials. (19 refs.)

102380 Highly doped sputtered amorphous silicon without hydrogen. R.W.Fane, Y.Zaka (Dept. of Phys., Univ. of Aston, Birmingham, England).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.1-7 (Aug. 1983).
A method of producing high resistivity amorphous silicon ($\sim10^8$ Ω cm) by sputtering without any addition of hydrogen or halogen is described. Such material has been doped n-type using tantalum, to give conductivity values in excess of 1 (Ω cm)$^{-1}$. (17 refs.)

102381 The interpretation of the electric and optical properties of a-Si:H films produced by RF glow discharge through dark conductivity, photoconductivity and pulse controlled capacitance-voltage measurements. R.Martins, A.G.Dias, L.Guimaraes (Centro de Fisica Molecular, Univ. de Lisboa, Lisboa, Portugal).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.9-22 (Aug. 1983).
This paper deals with the interpretation of transport properties of amorphous silicon hydrogenated films (a-Si:H) through dark conductivity, photoconductivity and pulse controlled capacitance-voltage measurements. a-Si:H films were produced by RF glow discharge coupled either inductively or capacitively to a 3% SiH_4/Ar mixture at different crossed electromagnetic static fields. The data concerned with the dark activation energy, photoactivation energy, variation of the density of localized states and photosensitivity, $(\sigma_{ph}/\sigma_d)_{25°C}$, of a-Si:H films can account for their optoelectronic properties which are strongly dependent on the deposition parameters. The authors also observed that crossed electromagnetic static fields applied during film formation influences hydrogen incorporated in a different manner than previously proposed. (21 refs.)

102382 Electrical and optical properties of RF-SP a-Ge:O:(H) deposited from GeO_2. Y.Takano, H.Ozaki (Dept. of Electrical Engng., Waseda Univ., Tokyo, Japan).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.119-27 (Aug. 1983).
The electrical and optical properties of a-Ge:O:(H) prepared from sintered GeO_2 are investigated. Unlike SiO_2, GeO_2 can be reduced with H_2 gas. The properties of a-Ge:O:(H) thus prepared can be changed widely with the H_2 gas pressure, approaching those of a-Ge. It is found that, in addition to these changes, a configurational change from Ge-O-Ge to oxygen-vacancy complex occurs with increasing the H_2 gas pressure. (11 refs.)

102383 Electrical conductivity and phase transitions of the solid electrolyte system $(Cs_{1-y}Rb_y)Cu_4Cl_3(I_{2-x}Cl_x)$. S.Geller, A.K.Ray (Dept. of Electrical Engng., Univ. of Colorado, Boulder, CO, USA), K.Nag.
J. Solid State Chem. (USA), vol.48, no.2, p.176-88 (1 July 1983).
Results of electrical conductivity measurements, thermal analysis, and X-ray diffraction studies indicate the existence of four phases, between 295K and the melting points, in the system $(Cs_{1-y}\text{-}Rb_y)Cu_4Cl_3I_2$. These phases are designated α, α', β, γ in order of decreasing temperature. The α phase is isostructural with α-$RbAg_4I_5$; the α' phase is also cubic and very likely belongs to space group $P2_13$, a subgroup of $P4_132$ and $P4_332$ to which the α phase belongs. There is a high probability that the $\alpha'\rightarrow\alpha$ transition is continuous. The $\alpha'\rightarrow\alpha$ transition is not discernible in the conductivity measurements or thermal analysis; therefore the line of α'-α transitions is presently unknown. The β phase transforms to the α', and the γ phase transforms to the β phase when $y\leq0.36$; the γ phase transforms to the α phase when $y\geq0.36$. That is, there is a triple point at $y=0.36$, $T=399$K. The γ-β, β-α', and γ-α transitions are all hysteretic and are therefore first order. The conductivities of the β phases are relatively low and the enthalpies of activation relatively high. The conductivity of the β phase decreases with increasing y. The β phase probably belongs to space group $R3$, in which the Cu^+ ions can be ordered. The α and α' phases are the true solid electrolytes; the conductivities are high, >0.73 Ω^{-1}-cm^{-1} at 419K, and the enthalpies of activation of motion of the Cu^+ ions low, 0.11 eV. In the system $CsCu_4Cl_3(I_{2-x}Cl_x)$, $0\leq x\leq0.25$, the Cl^- for I^- substitutions affect the transitions to only a small extent relative to the stoichiometric compound. The β phase occurs for all x and transforms to α'. (17 refs.)

102384 Transport studies of S-Se amorphous semiconductors. M.F.Kotkata (Phys. Dept., Ain Shams Univ., Cairo, Egypt), M.H.El-Fouly, A.Z.El-Behay, L.A.El-Wahab.
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.163-71 (Aug. 1983).
The homogeneous glass-forming region for air-quenched melts in the binary chalcogenide system S-Se is reported together with metastable melt crystallization temperatures and differential thermal analysis data for glass powder heated at different rates in a nitrogen atmosphere under standardized conditions. The compositional dependence of the electrical activation energy, the density of the glass transition temperature were measured in an effort to correlate the chemical binding with the physical properties. Myuller's valence theory of the electrical conductivity of glasses was applied to calculate the 'steric factor' β defining the degree of departure of σ_0(exp) from σ_0(theor). A thermodynamic technique was used to study the devitrification process for different amorphous compositions of the system S-Se. New data concerning the compositional dependence of the non-isothermal crystallization kinetics parameters are presented and discussed. (23 refs.)

102385 Electrical studies on $(Mo/W)Se_2$ single crystals. I. Electrical resistivity. M.K.Agarwal, P.D.Patel, O.Vijayan (Dept. of Phys., Sardar Patel Univ., Vallabh Vidyanagar, India).
Phys. Status Solidi a (Germany), vol.78, no.1, p.133-6 (16 July 1983).
The electrical resistivity of the single crystal solid solutions $Mo_xW_{1-x}Se_2$ ($0\leq x\leq1$), grown by a direct vapour transport technique is studied in the temperature range from 300 to about 600K. The room temperature values of resistivity are 1.43 Ω cm for p-type 2H-WSe_2 and 2.36 Ω cm for p-type 2H-$MoSe_2$. The study reveals that the crystals are intrinsic semiconductors in the temperature range of investigation. (19 refs.)

102386 Variable-range-hopping conduction in a strong magnetic field. R.Mansfield, H.Tokumoto (Dept. of Phys., Bedford Coll., London, England).
Philos. Mag. B (GB), vol.48, no.1, p.L1-4 (July 1983).
Shklovskii (1982) has recently proposed a new theory to account for variable-range hopping in a strong magnetic field which allows for multiple scattering while tunnelling in a transverse magnetic field. A temperature dependence of resistivity $p_0 \exp(T_0/T)^{1/2}$ is obtained in agreement with the results of Tokumoto et al. (1982) on n-InSb in the magnetic freeze-out region. This letter discusses the application of this theory to these results. (3 refs.)

102387 n-type $CdCr_2Se_4$: a Mott extrinsic semiconductor. M.Heritier (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).
Phys. Rev. B (USA), vol.28, no.2, p.1136-7 (15 July 1983).
Recent photoemission studies in $CdCr_2Se_4$ give direct evidence for the transport of excess electrons in a narrow d band. This implies that the large anomalies in optical and transport properties near the Curie point are not due to s-d exchange, but to strong d-electron correlations. (19 refs.)

102388 Activity coefficient and the Einstein relation. P.T.Landsberg (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA), A.G.Guy.
Phys. Rev. B (USA), vol.28, no.2, p.1187-89 (15 July 1983).
A connection between the activity coefficient of current carriers and the Einstein relations is established by two methods, one based on normal semiconductor concepts and one based on irreversible thermodynamics. The connection holds for all densities of states, for Fermi degeneracy, and in the presence of heavy doping. (13 refs.)

102389 Electrical conductivity and optical transmission of phases of the Li_2S-Sb_2S system. Correlation between structure and physical properties. J.Olivier-Fourcade, L.Izghouti, J.-C.Jumas, E.Philippot (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.385-95 (1983). In French.
Electrical conductivity and optical transmission measurements show a high-resistivity semiconductor behaviour for compounds of the Li_2S-Sb_2S_3 system with a crystal structure built up from ribbons, sheets or tridimensional networks based on large SbS_5E units with a weak activity of the lone pair E. For $Li_{3x}Sb_{6-x}S_9$ solid solution, with $x=0.333$ and 0.5, the higher electrical conductivity for $x=0.333$ is explained by the existence of a partly occupied antimony site which is filled up by lithium cations when $x=0.5$. The lithium antimonates are different from most of the other alkaline antimonates because the lithium and antimony atoms, with closely related radii, are located in the same kind of crystallographic sites. (11 refs.)

102390 Solid-gas interaction influence on the conductivity of molybdenum sulphides in the vicinity of an order-disorder transition. P.Belougne, J.C.Giuntini, J.V.Zanchetta (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.426-37 (1983). In French.
The study of the electrical conductivity of molybdenum sulfides MoS_{2+x} $(0\leq x\leq 1)$ (DC, AC conductivity and temperature dependence) shows the existence of an order-disorder pseudotransition appearing during the thermal treatment (TT) of the samples. This pseudotransition takes place around 700°C. The solid-gas interaction (mainly with water) determined by conductivity measurements, shows a different behaviour of the sulfides according as TT is lower or higher than 700°C. In the case of amorphous and poorly organized compounds (TT<700°C) the results suggest a dismutation of Mo^{5+} into Mo^{4+} and Mo^{6+} ions. These last ions would be active sites participating in a hopping conduction mechanism. When TT>700°C, the adsorption of water leads to an explicative mechanism, founded on its decomposition. (27 refs.)

102391 Low temperature hopping diffusion in doped semi-conductors. J.G.Ramos (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Campinas, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.619-25 (Dec. 1982).
Mott's law for the low temperature hopping conductivity is reconsidered to take account of the fact that the site wave functions are more localized than the hydrogenic-like wave functions. With Gaussian-like functions a $T^{-2/5}$ law for the logarithm of the conductivity is obtained, in good agreement with experimental data. The low temperature diffusion coefficient, of *n*-CdS, which can be measured through spin flip Raman scattering in doped semiconductors is shown to have the same temperature behavior, in the temperature range from 10K to 50K. (13 refs.)

102392 Charge transport at mid-gap in trans-$(CH)_x$: An electrochemical study. J.H.Kaufman, T.-C.Chung, A.J.Heeger (Inst. for Polymers & Organic Solids, Univ. of California, Santa Barbara, CA, USA).
Solid State Commun. (USA), vol.47, no.8, p.585-9 (Aug. 1983).
Electrochemical studies demonstrate that ~300 ppm of charge (equal to the number of neutral solitons in undoped trans-$(CH)_x$) is removed at mid-gap. These charges are transported through the polyacetylene electrode via hopping among states at the center of the energy gap, in agreement with Kivelson's theory. From analysis of the data, the authors have been able to determine the soliton creation energy, $E_s\simeq 0.5$ eV, which is in good agreement with the theoretical value, $E_s=(2/\pi)\Delta$. (21 refs.)

102393 Influence of the character of carbon black distribution on electrical conductivity of binary blend of polymers. Yu.S.Lipatov, E.P.Mamunya, N.A.Gladyreva, E.V.Lebedev.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1483-9 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The electrical conductivity of a polymer composition based on PE-POM blend and carbon black has been studied as a function of the character of filler distribution. For the formation of composition by means of dilution of POM—carbon black blend by the second polymeric component—PE—the localization of the filler on the boundary of blend components proceeds resulting in the formation of a conductive network of the filler and permitting one to attain the high values of electrical conductivity at small content of carbon black. (20 refs.)

72.20H High-field and nonlinear effects

102394 The energy relaxation time and electron temperature of hot electrons in n-Ge. H.Stramska (Inst. of Experimental Phys., Warsaw Univ., Warsaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.55-8 (July 1983).
Measurements of the DC conductivity at 77K lattice temperature vs. electric field for n-Ge are analyzed to determine the energy relaxation time τ_ϵ and electron temperature T_e of hot carriers. A relatively simple technique for computing the energy relaxation time dependence on the electric field is proposed. A theory starting from Boltzmann transport equation is used in the experimental determination of the energy relaxation time. The electron temperature vs. electric field is also determined. (6 refs.)

102395 High field conduction in solution-grown polyvinylidene fluoride (PVF_2) films. P.C.Mehendru, S.Chand (Nat. Phys. Lab., New Delhi, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.323-6 (June 1983).
Current-voltage (*I-V*) characteristics of PVF_2 films grown from the solution and characterized by having $(\alpha+\beta)$ crystalline modification have been studied as a function of temperature and thickness in the M-P-M sandwich configuration. The *I-V* curves show two distinct regions of conduction, namely the comparatively low-field ohmic region with a slope ~1 and the high field non-ohmic region with a slope ≤ 2. The high field non-ohmic behaviour has been attributed to the tunnelling of charge carriers into or via the traps, the tunneling process being a thermally activated one. (18 refs.)

102396 High field single injection current in solid state diode with shallow traps by exact method. A.S.Verma, Y.K.Sharma, R.S.Agrawal, C.S.Agrawal (Dept. of Phys., RBS Coll., Agra, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.357-8 (June 1983).
An exact method is used to evaluate the current-voltage characteristic of a single injection solid state diode with shallow traps operating in a high field regime. A set of curves are drawn for various values of the parameter characterizing the shallow traps. (5 refs.)

102397 Remnant conductivity in polymer semiconductors of polynaphthol and polyhydroquinone. S.Kh.Khalilov, Sh.G.Gamidov, Yu.G.Nurullaev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.99-102 (1982). In Russian.
After the application of a strong electric field ($>10^5$V/cm) high electron conductivity is retained for a long time. The obtained data are explained by the specific influence of the electric field upon the potential barriers between the polyjunction regions. (14 refs.)

102398 Propagation of strong electromagnetic waves in Kane semiconductors. M.M.Babaev, T.M.Gasymov, A.A.Katanov, F.K.Kocharli, V.A.Pogrebnyak.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.72-82 (1982). In Russian.
Propagation of a strong (heated) electromagnetic waves in nondegenerate semiconductors with an isotropic nonparabolic spectrum of the electrons is investigated. Expressions for the damping of the field and carriers temperature have been established under the conditions of a nonlinear normal and anomalous skin-effects both in the presence and absence of the nonquantized magnetic field. The effect self-action of the plane waves is studied, and it is shown that in the presence of strong magnetic fields under the condition of circularly polarized waves the real part of the dielectric permittivity does not depend on the electron temperature T_e and parabolicity degree. The heating of the electrons by electromagnetic waves is studied. It is shown that under the normal skin-effect in the strong magnetic field T_e does not depend on the nonparabolicity degree and in the strong heating case $T_e\sim E^2$, if the electrons are scattered by acoustical phonons (both for the deformation and piezoelectric potential interactions). In other cases nonparabolicity of the spectrum essentially affects T_e, damping depths, the self-action factors of the field and the electron temperature. (8 refs.)

102399 Effects of keV electron irradiation on the avalanche-electron generation rates of three donors on oxidized silicon. C.-T.Sah, J.Y.-C.Sun, J.J.-T.Tzou (Dept. of Electrical Engng., IL, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4378-81 (Aug. 1983).
After keV electron beam irradiation of oxidized silicon, the avalanche-electron-injection generation rates and densities of the bulk compensating donor, the interface states, and the turnaround trap all increase. Heating at 200°C can anneal out these three donor-like traps; however, it cannot restore the generation rates back to their original and lower pre-keV electron irradiation values. The experimental results also indicate that all three traps may be related to the same mobile impurity species whose bonds are loosened by the keV electrons and then broken or released by the avalanche injected electrons. (13 refs.)

102400 The relation between contact potential and planar conduction as a-Si:H films undergo gas adsorption or temperature changes. J.Abelson, G.de Rosny (LPNHE, Ecole Polytech., Palaiseau, France).
J. Phys. (France), vol.44, no.8, p.993-1003 (Aug. 1983).
When the free surface of an amorphous silicon thin film is exposed to water vapour, the contact potential and planar conductance simultaneously change. For three examples, the authors correlate the two measurements and interpret them in terms of adsorbate induced changes of the surface potential, similar to field effect experimental analysis. During temperature cycles, there is a strong correlation between non-linear portions of the log conductance versus $1/T$ plots and the variation of the contact potential. (14 refs.)

102401 Coherent Zener oscillations. P.Roblin, M.W.Muller (Dept. of Electrical Engng., Washington Univ., St Louis, MO, USA).
J. Phys. C (GB), vol.16, no.23, p.4547-54 (20 Aug. 1983).
Studies quasiclassical solutions of a quantum system, a crystal electron in a uniform steady electric field. Classical solutions can be formed from wave-packets of Houston functions or Stark states which are tightly localised in both position and crystal momentum. The position and momentum can be localised initially within the uncertainty principle. However while the momen-

tum uncertainty is conserved with time the position uncertainty oscillates with the Zener period. It is maximal as the inflection points of the band structure. The departure from the initial value of the position uncertainty depends on the band structure and is inversely proportional to the field. For fields lower than ~ 10 kV cm^{-1} the electron can only be tightly localised for times short compared with low-field scattering times. For fields higher than ~ 10 kV cm^{-1} the electron can be tightly localised throughout the whole Zener orbit. (6 refs.)

102402 Non-linear transport and transient properties of semiconductors under high electric field. N.Sawaki (Dept. of Electronics, Nagoya Univ., Nagoya, Japan).
J. Phys. C (GB), vol.16, no.23, p.4611-22 (20 Aug. 1983).
The current in a semiconductor under a high electric field is studied by solving the Liouville equation. The formal theory is developed using the Stark ladder representation, and the infinite series of a perturbation expansion for the weak electron-phonon coupling is evaluated. The effect of an electric field on the scattering matrix is studied in terms of the self-energy due to higher-order scatterings. It is shown that the real part of the self-energy, as well as the imaginary part, has a role in the transport properties. The results are applied to the velocity overshoot and the ballistic effect in a short semiconductor device. It is found that the velocity overshoot is realised by the inelastic nature of the scattering while the ballistic effect arises from the variation of the self-energy with time or the correlation effect. (26 refs.)

102403 A model for impact ionisation in wide-gap semiconductors. B.K.Ridley (Dept. of Phys., Univ. of Essex, Colchester, England).
J. Phys. C (GB), vol.16, no.23, p.4733-51 (20 Aug. 1983).
Mean free paths associated with the scattering of electrons and holes are derived from experiments on impact ionisation in wide-gap semiconductors using the lucky-drift model. It is found that the mean free path for an electron or hole in any semiconductor obeys a simple universal law which implies a common phonon energy for electron and hole scattering and a dependence of mean free path on threshold energy ($\lambda \propto E_i^{-1/2}$). The latter dependence is plausible in terms of a simple view of scattering of high-energy carriers in a nonparabolic band. This universal model is derived on the basis of experimental data reported by various authors in Si, Ge, GaAs, and InP. Results for GaSb and its alloys appear to be anomalous, whereas data from GaInAs in InGaAsP tend to support the model. The model predicts the ratio of ionisation coefficients $k=\beta/\alpha$ and its dependence on field and temperature. It is shown that k in any semiconductor is determined by only the ratio of threshold energies of electrons and holes. A comparison with reported values is made and brief discussions of the spin-orbit resonance effect in AlGaSb and of the enhancement in GaAs/AlGaAs multilayers are given. (44 refs.)

102404 Inversion of hot carriers in Landau levels. V.A.Kozlov, L.S.Mazov, I.M.Nefedov, M.R.Zabolotskikh (Inst. of Appl. Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.3, p.170-4 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.142-4 (5 Feb. 1983).
A method is proposed for creating an inverted population of hot carriers in Landau levels of the light subband in crossed **E** and **B** fields. Impurity scattering in this case facilitates inversion and for it 'ultrapure' semiconductors are not required. (11 refs.)

102405 Poole-Frenkel centres in dielectrics. Kind and space density in plasma-polymerized organosilicon films. J.Tyczkowski, M.Kryszewski (Centre of Molecular & Molecular Studies, Polish Acad. of Sci., Lodz, Poland).
Phys. Status Solidi a (Germany), vol.78, no.1, p.259-65 (16 July 1983).
Measurements of anomalous transient 'photocurrents' are proposed to determine the kind (donor or acceptor) and spatial density of generation centres in dielectrics with the Poole-Frenkel electrical conduction mechanism. The results for plasma-polymerized hexamethyldisiloxane (pp HMDSO) are described as an example. It is shown that generation centres are acceptors and their space density is about 10^{24} m^{-3} in vacuum. It is found that water molecules give rise to an increase of this density. (23 refs.)

102406 The Frenkel thermal-field emission in $EuGa_2S_4$ single crystals. O.B.Tagiev (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR), G.M.Niftiev, I.M.Askerov.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K43-6 (16 July 1983).
Deals with the results of an investigation of the Frenkel thermal-field emission in $EuGa_2S_4$ single crystals in strong electric fields ($E \geq 10^4$ V/cm) in the temperature range from 270 to 327K. $EuGa_2S_4$ single crystals were obtained by the method of gas-transport reaction. Specimen contacts having (specimen thickness ≈ 70 μm) a resistivity on the order of $\approx 10^{10}$ Ωcm were made as sandwiches by fusing-in indium. (7 refs.)

102407 Impact ionization in rare earth doped CdF_2 crystals. V.Dallacasa, C.Paracchini (Istituto di Fisica, Univ. di Parma, Parma, Italy).
Radiat. Eff. (GB), vol.72, no.1-4, p.265-9 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
CdF_2 insulating crystals doped with Gd and Eu exhibit electrical conduction and electroluminescence under d.c. high fields. The electrical conduction is due to electrons hopping through discrete coulombic centres by means of a Poole-Frenkel effect. The electroluminescence takes place because of impact processes. The impact rate w is correlated to the electrical current and then evaluated as a function of the applied field F and the temperature T. The experimental relation $w=A\ \exp(-aT/F^{1/2})+B\ \exp(-\mathrm{b}b/F^{1/2})$ is obtained and it is interpreted on the basis of the conduction model, where electrons are scattered by charged impurity centres. (8 refs.)

102408 Third harmonic generation in a semiconductor with a negative differential conductivity. V.V.Zaitsev, P.V.Tyapukhin (Kuibyshev State Univ., Kuibyshev, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.775-8 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1075-9 (Sept. 1982).
The problem of transforming amplitude fluctuations of an input pump signal into fluctuations of a generated harmonic is investigated in the example of third harmonic generation in a semiconductor with a negative differential conductivity (NDC). An averaging method is used to derive a system of equations for the amplitudes and spectral densities of the amplitude fluctuations of the interacting waves. It is shown that frequency multipliers using an NDC semiconductor can have a high multiplication efficiency (exceeding 100%) and simultaneously suppress the amplitude fluctuations of the input signal. 72.20J Charge carriers: generation, recombination, lifetime, and trapping

102409 Single injection current in insulator with traps lying below the Fermi level. Y.K.Sharma, V.S.Raghav (Phys. Dept., RBS Coll., Agra, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.810-15 (1983).
Analytical expressions for the current-voltage characteristics have been given for an insulator containing a significant amount of traps lying below the Fermi level. The mobility of the current carriers varies with concentration in the insulator. The complete current-voltage characteristic can be divided into four regimes which have power laws for the characteristic from linear law in pure Ohm's law regime to cube law in the space-charge-limited trap-free regime. There is a very large change in current occurring over a restricted change in voltage. (5 refs.)

102410 The electrical conduction process in antimony trisulfide semiconducting thin films. Nam-Ki Min, Ha-Yong Park.
Trans. Korean Inst. Electr. Eng., vol.32, no.3, p.99-105 (1983). In Korean.
The mechanism of electrical conduction in thin films of antimony-trisulfide is briefly investigated. Three regions are distinguished in the experimental current(I)-voltage(V) relationship. With low voltages the I-V characteristic is ohmic, but at higher voltages the I-V characteristic exhibits an $I\ \alpha V^2$ dependence, then an $I\ \alpha V^3$ dependence. The square law (V^2) dependence can be accounted for by means of the singlecarrier(hole) space-charge-limited current. The cube law (V^3) dependence arises as a result of the double injection due to the electron injection through tunnelling from the cathode at a critical voltage. (13 refs.)

102411 Comparison of band-to-band Auger processes in InGaAsP. A.Sugimura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.930-2 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
The relation between different types of band-to-band Auger processes in InGaAsP is studied. According to a nonparabolic band model that makes use of $\bar{k}.\bar{p}$ perturbation theory, the Auger effect involving the excited split-off band (CHSH process) is dominant. The Auger effect involving the excited light hole band (CHLH process) is far less than the effect of the CHSH process or the Auger effect involving the excited conduction band (CHCC process). A simple parabolic band model overestimates the CHCC process by about one order of magnitude, and the CHLH process by more than ten orders of magnitude. (11 refs.)

102412 Theory of electron-hole kinetics in amorphous semiconductors under illumination: application to solar cells. R.E.Lagos, H.Suhl, T.Tiedje (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.3951-7 (July 1983).
A general kinetic theory of the generation and recombination of electron-hole pairs for an illuminated amorphous semiconductor with an arbitrary distribution of gap states is presented. The basic assumptions of the theory are first, that sharp mobility edges separate localized states from extended states, and second that the localized states can communicate with each other only via the extended states. In the limit that mobile carriers are concentrated at the band edges, the coupled nonlinear integral equations for the occupation functions can be reduced to quadratures. The theory is applied to calculate the current-voltage characteristic of amorphous silicon solar cells, in the 'lumped circuit' model where the spatial dependence is neglected. The open circuit voltage, the fill factor and the upper limit for the solar conversion efficiency of such devices are calculated as functions of the gap density of states. (49 refs.)

102413 Electric conduction of low density polyethylene induced by high dose rate gamma rays. S.Mochizuki, N.Tamura, K.Yahagi (JAERI, Gunma-ken, Japan).
J. Appl. Phys. (USA), vol.54, no.8, p.4433-8 (Aug. 1983).
Radiation induced conduction in low density polyethylene under gamma-ray irradiation at high dose rates, 1×10^3 to 1×10^4 Gy/h, was studied. After irradiation was initiated, the induced current quickly plateaus, but then subsequently begins to increase slowly with time until it attains an equilibrium value. The effect of the polarity and magnitude of the electric field and of the temperature upon time dependence of the induced current were investigated. The slowly increasing induced current can be explained by thermal detrapping from relatively deep traps; the trap depth is calculated to be ca. 0.8 eV. The induced current of the sample increases as its crystallinity increases. It was revealed that a sample with high crystallinity has shallow traps and consequently has many charge carriers and increases its induced current. (12 refs.)

102414 Hole transport in pure and doped GaAs. H.J.Lee (Dept. of Phys., Jeonbuk Nat. Univ., Jeonju, Korea), D.C.Look.
J. Appl. Phys. (USA), vol.54, no.8, p.4446-52 (Aug. 1983).
Uses a two-band model (heavy and light holes) to calculate the transport properties of *p*-type GaAs. The scattering mechanisms included are acoustic-mode deformation potential, acoustic-mode piezoelectric potential, polar- and nonpolar-mode deformation potential, ionized impurity, and space charge. Interband scattering is included explicitly for the optical phonons and phenomenologically for the acoustic phonons. The intraband polar optical-mode scattering, for which a relaxation time cannot be defined, was calculated by using the numerical method of Fletcher and Butcher (1972). The acoustic deformation-potential parameter and the coupling coefficient for interband scattering were calculated by fitting the theory to Hall-mobility data for both pure and doped samples. The authors have determined ionized-impurity and space-charge contributions for two of the samples, one doped with Cr and exhibiting an 0.33-eV activation energy (Cr^{4+}/Cr^{3+}), and the other heat-treated and exhibiting an 0.14-eV activation energy. The transport fit was carried out self-consistently with a statistical fit of the p vs. T data, to determine the relevant donor and acceptor concentrations. Individual plots of the mobility contributions from the various scattering mechanisms are also presented. Finally, useful plots of the Hall mobility and Hall r factor, as functions of carrier density and compensation ratio, are provided to aid others in the analysis of their samples. An important conclusion of this study is that the light-hole band strongly influences the transport properties, even though its density of states is small compared to that of the heavy-hole band. (28 refs.)

102415 Effect of photoelectrochemical etching on charge collection efficiency in CdS: An electron beam induced current study. G.Hodes, D.Cahen (Weizmann Inst. of Sci., Rehovot, Israel), H.J.Leamy.
J. Appl. Phys. (USA), vol.54, no.8, p.4676-8 (Aug. 1983).
Parallel secondary electron and charge collection images of a CdS/Au Schottky barrier show that photoetching of the CdS improves the charge collection efficiency. This is explained in terms of preferential removal of (near) surface recombination centers by the photoetching. Evidence is given that lack of photoetching of specific areas of the surface is due to the fact that such areas are photoelectrochemically inactive, possibly because of poor electrical contact with underlying CdS, and combined photoetching and scanning electron microscopy investigation is suggested as a way to check semiconductors for inactive regions. (11 refs.)

102416 On the phase-breaking time of electrons in a disordered two-dimensional system. Z.Ovadyahu (Dept. of Phys., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).
J. Phys. C (GB), vol.16, no.23, p.L845-8 (20 Aug. 1983).
Measurements of the inelastic mean free path in two-dimensional indium oxide films are reported. The results suggest that the phase-breaking time in this material varies as T^{-1}, which agrees with the dependence predicted by several theoretically known scattering mechanisms. On the other hand, the actual values of the inelastic mean free path, at the same temperature, seem to be essentially independent of the films bulk resistivity. This latter feature may suggest the existence of a phase-breaking mechanism characterised by a scattering time that is proportional to the resistivity. (17 refs.)

102417 Numerical approach to non-equilibrium carrier relaxation in picosecond and subpicosecond physics. J.Collet, T.Amand, M.Pugnet (Lab. de Phys. des Solides, INSA, Toulouse, France).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.368-74 (18 July 1983).
Presents a numerical resolution of the time-dependent Boltzmann equation which describes the electron relaxation kinetics in direct gas semiconductors under subpicosecond optical excitation. The calculation is specialized to GaAs. The authors investigate, around the Motte density, the conditions of internal thermalization and energy relaxation of electrons, which depend strongly on the plasma concentration. (22 refs.)

102418 Electrical properties of shallow implanted layers in silicon. B.N.Mukashev, Zh.A.Kusainov, K.Kh.Nusupov, S.Zh.Tokmoldin (Inst. of High energy Phys., Acad. of Sci., Alma-Ata, Kazakh SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K19-22 (16 July 1983).
The authors present the results of an electric property study of thin layers in silicon formed by low-energy implantation of boron, arsenic, and antimony ions. The implantations between 5 to 50 keV were carried out with an ion accelerator at normal operation. The dependence of the effective surface carrier concentration on the isochronal annealing temperature obtained for different energy arsenic implants but for the same dose (2×10^{14} cm^{-2}) is given. Identical results are observed for layers implanted by antimony ions. (16 refs.)

102419 Monte Carlo simulations of geminate-pair dissociation in discrete anisotropic lattices. B.Ries, G.Schonherr, H.Bassler (Fachbereich Phys. Chem., Philipps-Univ. Marburg, Marburg, Germany), M.Silver.
Philos. Mag. B (GB), vol.48, no.1, p.87-106 (July 1983).
Field- and temperature-assisted dissociation of carrier pairs produced by the absorption of radiation has been simulated for perfectly isotropic (3D) and perfectly linear (1D) systems composed of a discrete array of hopping sites, as well as for systems with anisotropic hopping rates parallel and perpendicular to a preferred direction. For the 3D and 1D systems the exact solutions of the Onsager formalism are recovered. In neither case is Poole-Frenkel behaviour observed. The dissociation yield increases with increasing separation a of the hopping sites. The governing parameter is $\Delta U/kT$, where ΔU, which is a function of a, is the difference in potential energy between the sites at which a carrier starts its random walk and the nearest neighbour site in the direction of the field. Agreement with experimental data for organic solids indicates that the assumption of field-independent hopping rates implicitly contained in both simulations and analytic theory is justified. Anisotropy of the carrier transport coefficient has a marked effect on the zero-field dissociation yield. On the basis of the computer results, an analytical expression is proposed that relates $\phi(E=0)$ and $\mu_{\parallel}/\mu_{\perp}$. The effect of finite sample size on the zero-field yield is also treated quantitatively. (37 refs.)

102420 Dynamics of photohole trapping in silver chloride. E.Laredo, W.B.Paul, S.-E.Wang, L.G.Rowan, L.Slifkin (Dept. of Phys., Univ. of North Carolina, Chapel Hill, NC, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.97-102 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
EPR experiments on photoholes in both AgCl:Cu and AgCl:Cu and AgCl:Pd show the existence of an activation energy barrier, of height near 1.8 meV, in the transition to the localized self-trapped state. The self-trapped hole then migrates athermally via the small-polaron band, for temperatures below 30K, and by phonon-assisted hopping for temperatures above 35K. In the hopping regime, the activation energy is 61 MeV, suggesting that the binding energy is about 0.1 eV. From the pre-exponential factor, one estimates that the electron transfer integral is about 1% of the energy of the pertinent acoustical phonon. Experiments on AgX:Cu in which 1% of the halide is Br^- show that all of the self-trapped holes ultimately migrate to sites with 2 bromide neighbors. Upon annealing, these disappear with complex kinetics and an activation energy of about 180 meV. In AgCl:Pd,Fe, the temperature-dependence of the efficiencies of production of trapped photocarrier centers is determined and correlated with the dynamics of migration of the self-trapped hole and the cation vacancy. (16 refs.)

102421 Trapping and recombination cross sections for electrons in silver halide. J.F.Hamilton (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.103-6 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
In a currently accepted model for formation of the photographic latent image, the photoefficiency is determined by the relative cross sections for electron capture at a silver site and at a bound hole. Comparison with sensitivity data shows that these cross sections are nearly identical. The two types of competing centers have sets of shallow Coulombic levels with equal initial cross sections, but re-escape of the electron from these levels should be more probable than transition to the deep level, and it is not clear why the final capture probabilities should be equal for the two very different centers. (20 refs.)

102422 Aspects of *e-e-h* Auger recombination in silicon. V.Grivickas (Kapsukas Vilnius State Univ., Vilnius, Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.63-6 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.83-8 (1982).
Considers the effect of the structure of the valence band on the probability of e-e-h Auger recombination in nondegenerate silicon. It is found that the statistical distribution of combining holes is responsible for the relatively large Auger coefficient C_n and the weak temperature dependence $C_n(T)$ for carrier concentrations $n_0 \lesssim 10^{18}$ cm^{-3}. (12 refs.)

102423 Influence of carbon and hydrogen segregation on the electrical properties of grain boundaries in polycrystalline silicon sheets. O.Rallon, M.Aucouturier (Lab. de Metall. Phys., Univ. Paris-Sud, Paris, France), C.Texier-Hervo, M.Mautref, C.Belouet.
Sol. Cells (Switzerland), vol.9, no.3, p.149-57 (Aug. 1983).
In the article the properties of grain and twin boundaries in polycrystalline silicon layers grown by the ribbon-against-drop process are reported; the thermal diffusion of phosphorus, the electrical activity of these defects and their passivation by hydrogen are discussed. Autoradiography experiments did not evidence any significant intergranular diffusion of phosphorus; crossed electron-beam-induced current (or light-beam-induced current) and autoradiography experiments strongly suggest that the recombination at grain and twin boundaries is dominated by impurities. Finally, it is shown that the hydrogen passivation is associated with retarded diffusion and large segregation effects. (17 refs.)

102424 Time of flight of carriers in simple aromatic hydrocarbon layers. I. Theory. G.W.Bak (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland).
Thin Solid Films (Switzerland), vol.105, no.2, p.177-81 (15 July 1983).
It has been found that the drift velocity of carriers in polycrystalline layers of simple aromatic hydrocarbons increases proportionally to the electric field and saturates at a field of 2×10^6 V m^{-1}. In addition it has been inferred that the predominant conduction mechanism in polycrystalline simple aromatic hydrocarbon layers is a hopping process between localized states within the 'impurity' band at the Fermi level. A simple model to explain the phenomenon was put forward earlier. The problem is discussed more exactly, using the assumption that so-called 'difficult' jumps of carriers play a significant role in the transport of carriers in polycrystalline simple aromatic hydrocarbon layers. (12 refs.)

102425 Time of flight of carriers in simple aromatic hydrocarbon layers. II. Comparison with experimental results. G.W.Bak (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland).
Thin Solid Films (Switzerland), vol.105, no.2, p.183-6 (15 July 1983).
For pt.I see ibid., vol.105, p.177 (1983). The change in the average distance between the localized states at the Fermi level, which form hopping paths, was calculated as a function of the electric field. The results of the calculations were used to obtain the dependence of the carrier drift velocity on the electric field. A comparison with experimental results was also made. (6 refs.)

102426 Continuous bifurcation and dissipative structures associated with a soft mode recombination instability in semiconductors. E.Scholl (Inst. fur Theoretische Phys., RWTH Aachen, Aachen, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.204-11
There exist numerous physical, chemical and biological examples of nonlinear dynamical systems which exhibit bifurcation and dissipative structures far from equilibrium. The author considers a semiconductor, subject to generation, recombination, and diffusion of carriers, with an externally applied electric field. This field heats the electrons up, and drives the system far from thermal equilibrium. The steady state is determined by the balance of various nonlinear generation and recombination processes, among which impact ionization of free or bound carriers represents the essential autocatalytic step. The dissipative dynamical system described by the semiconductor transport equations may give rise to soft-mode instabilities, saddle-node and Hopf bifurcations, limit cycle oscillations, bifurcation of spatially inhomogeneous dissipative structures, and nonequilibrium phase transitions between low and high current states. 72.20M Galvanomagnetic and other magnetotransport effects

102427 Crystal symmetry effects of the conduction tensor. P.Debreceni, I.Kirschner, T.Porjesz (Dept. for Low-Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.395-400 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Some considerations are given about the Onsager-Kohler relations with respect to the linear dependence or independence of the magnetoresistivity (MR) effects. The symmetry properties of the heat conductivity tensor are investigated to elucidate a possible experimental proof of the Onsager-Kohler relations. (14 refs.)

102428 Negative magnetoresistance in graphite and its alloys with small potassium concentration. L.Yu.Matzui, E.I.Khar'kov.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.760-3 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
Temperature and field dependences of negative magnetoresistance in disordered graphites and their alloys with small impurity of potassium have been investigated in the temperature range 4.2-300K and magnetic fields up to 60 *kOe*. Obtained data are compared with theory considering quantum additions to conductivity in the magnetic field as due to localization effects of electrons and interference of electron-electron and impurity scattering. (10 refs.)

102429 Theory of the quantized Hall conductance. B.I.Halperin (Inst. of Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.75-102 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The quantized Hall conductance occurs in two dimensional electron systems at low temperatures and strong magnetic fields. When the Fermi level is between two Landau levels, the longitudinal resistivity ρ_{xx} is observed to vanish, while the Hall conductance $1/\rho_{xy}$ is quantized in precise integer multiples of the unit e^2/h. These effects can be explained using an essentially one-electron analysis. Recently, however, 'anomalous' Hall conductance plateaus have been discovered at certain simple fractions ν of the unit e^2/h, in a situation where a Landau level is partially filled. Explanation of this effect requires that the electrons form a new type of correlated quantum liquid with a commensurate locking term (i.e. a downward cusp) in the energy at the corresponding filling fractions. (45 refs.)

102430 Effect of magnetic field on the drain current of JFET BFW-61. N.M.Murthy, P.M.Reddy, S.V.Subrahmanyam (Dept. of Phys., Sri Krishnadevaraya Univ. Coll., Anantapur, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.363-4 (June 1983).
The effect of magnetic field (B) on the drain current of FET BFW-61 has been studied. A decrease in drain current on the application of magnetic field has been observed in all the three cases studied, namely B parallel to current flow ($B\|$), B perpendicular to the current flow and along the width of the crystal ($B\perp W$) and B perpendicular to the current flow and along the thickness of the crystal ($B\perp T$). The change in drain current on the application of B has been found to be in the order when $B\perp T > B\| \simeq B\perp W$. The results have been explained as due to the combined effects of Hall effect and magnetoresistance. (11 refs.)

102431 The galvano and the thermomagnetic effects in semiconductors for the scattering of the charge carriers on the polar optical phonons. M.I.Aliev, F.M.Gashimzade.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.71-7 (1982). In Russian.
The transverse magnetoresistance $\Delta\rho/\rho$ and Nernst-Ettinghausen $Q^{\perp}$ effects in semiconductors for the case of arbitrary values of magnetic fields and the temperature are considered. The consideration is made by the introduction of the approximate time of relaxation for the scattering of the charge carriers on the polar optical phonons. The results of the numerical calculations of and $Q^{\perp}$ for p-type GaAs are compared with the experimental data. (6 refs.)

102432 Hall effect studies in germanium doped $Al_xGa_{1-x}As$. A.W.Nelson, P.N.Robson (Dept. of Electrical & Electronic Engng., Univ. of Sheffield, Sheffield, England).
J. Appl. Phys. (USA), vol.54, no.7, p.3965-72 (July 1983).
Germanium doping of $Al_xGa_{1-x}As$ has been studied over the range x=0.22-0.40 by measuring the Hall effect in epitaxial layers grown by liquid phase epitaxy. Hall measurements were carried out in the temperature range 70-300K and the resulting mobilities and carrier densities were analyzed as a function of temperature. These analyses have shown that the Hall to drift mobility ratio in this material, previously assumed to be around unity, is ~0.6 and that Ge produces two acceptor levels in $Al_xGa_{1-x}As$. The dominant acceptor level has an activation energy which increases monotonically with x and has a value of ~160 meV at $x=0.40$. A shallow level of much lower concentration has also been found at an energy of 20-40 meV above the valence band edge. In addition the authors have found the level of compensation in the material to be low. (34 refs.)

102433 Thermodynamic derivation of the Hall current and the thermopower in quantising magnetic field. P.Streda, L.Smrcka (Inst. of Phys., Czechslovak Acad. of Sci., Praha, Czechoslovakia).
J. Phys. C (GB), vol.16, no.24, p.L895-9 (30 Aug. 1983).
Expressions describing the Hall conductivity and the thermopower of a two-dimensional system in high magnetic fields are derived using the thermodynamic arguments. The main attention is paid to the quantum regime, in which the Fermi energy is lying in an energy gap between two neighbouring Landau levels. It is found, in this case, that the Hall conductivity and the thermopower arise as a response of surface magnetisation currents in the sample to the applied electric field and the thermal gradient. (9 refs.)

102434 On the memory-function formulation of the dynamic conductivity for two-dimensional electrons in a magnetic field. Y.Shiwa, A.Isihara (Dept. of Phys., State Univ. of New York, Buffalo, NY, USA).
J. Phys. C (GB), vol.16, no.24, p.4853-64 (30 Aug. 1983).
By considering electron-electron and electron-impurity scattering, a new exact formula for the memory function of AC conductivity based upon a projection operator formalism is obtained for two-dimensional electron systems in a magnetic field. This formula is free from an undesired divergence, and leads to various approximate expressions used in the literature in the limit of small impurity concentration or strong magnetic field. (18 refs.)

102435 Population inversion due to separate shift and heating of light and heavy holes in semiconductors. Yu.K.Pozhela, E.V.Starikov, P.N.Shiktorov (Semiconductor Phys. Inst., Acad. of Sci., Lithuanian SSR).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.361-4 (18 July 1983).
A new model for hole-population inversion insensitive to low-temperature optical-phonon scattering is proposed. The differences of hole temperatures and the separate shift of their distribution functions in momentum space are shown to be sufficient for the population inversion at a certain momentum. Thus, population inversion is also possible at room temperature, which is confirmed by Monte Carlo calculations for p-type Ge in crossed E and B fields. (13 refs.)

102436 Fractional quantization of Hall conductance. R.Tao, D.J.Thouless (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1142-4 (15 July 1983).
It is shown how the correlation energy of a system of two-dimensional electrons in a strong magnetic field may be enhanced if the electrons are in a regular array of the Landau orbitals. This gives an energy gap if the proportion ν of occupied orbitals is a simple fraction without giving rise to charge-density waves which may pin the system. The gap is determined self-consistently. Such a state can give rise to the plateaux in the Hall conductance observed at fractional multiples of e^2/h. (12 refs.)

102437 Electrical properties of low-compensation GaAs. D.C.Look (Univ. Res. Center, Wright State Univ., Dayton, OH, USA), P.C.Colter.
Phys. Rev. B (USA), vol.28, no.2, p.1151-3 (15 July 1983).
Recently the authors have reproducibly grown vapor-phase epitaxial GaAs, with less than 10% compensation, in an $AsCl_3$-Ga-H_2 reactor. The low-temperature electrical properties of such samples are quite interesting, with neutral-impurity scattering and screening being much more important than usual. The Hall mobility is typically above 10^5 cm^2/V sec at 5K and has two maxima as a function of temperature, the usual one near 50K and another near 9K. The latter phenomenon has not been observed before, to the authors' knowledge. The mobility and carrier concentration temperature dependences for a low-compensation sample and a normal-compensation sample are theoretically fitted to determine the donor and acceptor concentrations. The low-compensation sample has $N_A/N_D=0.06\pm0.03$. (14 refs.)

102438 Quantized Hall conductance in a relativistic two-dimensional electron gas. A.H.MacDonald (Eidgenossische Tech. Hochschule Honggerberg, Zurich, Switzerland).
Phys. Rev. B (USA), vol.28, no.4, p.2235-6 (15 Aug. 1983).
The formula for the quantized Hall conductance in a two-dimensional electron gas is often derived by solving the Schrodinger equation for an electron in crossed electric and magnetic fields, and taking the expectation value of the current operator in its eigenstates. In this report the author demonstrates explicitly, by using the Dirac equation, that there are no relativistic corrections to this expression, at least in the ideal case. This is true even if the drift velocity of the electrons approaches the speed of light or the Landau level splitting approaches the electron rest-mass energy and holds despite the appearance of a classical correction to the cyclotron frequency. (16 refs.)

102439 Remarks on the Laughlin theory of the fractionally quantized Hall effect. P.W.Anderson (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2264-5 (15 Aug. 1983).
An extension of the Laughlin theory of the anomalous quantum Hall effect to allow for integer numerators for the occupation fraction is proposed. (3 refs.)

102440 The quantized Hall effect. H.L.Stormer (Dept. of Electronic & Optical Properties of Solids, Bell Labs., Murray Hill, NJ, USA).
Science (USA), vol.220, no.4603, p.1241-6 (17 June 1983).
Quantization of the Hall effect is one of the most surprising discoveries in recent experimental solid-state research. At low temperatures and high magnetic fields the ratio of the Hall voltage to the electric current in a two-dimensional system is quantized in units of h/e^2, where h is Planck's constant and e is the electronic charge. Concomitantly, the electrical resistance of the specimen drops to values far below the resistances of the best normal metals. (16 refs.)

102441 Capacitance oscillations in quantized Hall effect. J.Bok, M.Combescot (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France).
Solid State Commun. (USA), vol.47, no.8, p.611-13 (Aug. 1983).
The authors show that in the conditions where the quantized Hall effect is observed, capacitance oscillations of the junction should be present. A comparison between the plateaux of Hall resistance and the amplitude of the capacitance oscillations gives the amount of localized states in the two-dimensional electron gas. (8 refs.)

102442 Inductive coupling caused by Hall eddy currents in a semiconductor cylinder. J.Pozela, R.Tolutis, T.Ebersonas, Z.Jankauskas (Inst. of Semiconductor Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.39-44 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.50-6 (1982).
A theoretical determination is presented of the inductive coupling between crossed inductance coils, due to an isotropic semiconductor core in the form of a cylinder in a constant magnetic field. It is shown that this coupling, as in the case of a core in the form of a thin semiconductor plate, is related in fairly simple fashion to the electrical parameters of the semiconductor. The theoretical calculations are confirmed experimentally. It is shown that it is possible to measure the mobility of charge carriers in the cylindrical specimen. (3 refs.)

102443 The transition metal influence on some physical properties of $Sn_{1-x}Mn_xTe$ (where Me=Mn, Cr, Fe, Ni, Co) alloys. M.A.Alidzhanov, I.R.Gurbanov, M.G.Saidov, K.Dovletov, A.P.Gurshumov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.103-5 (1982). In Russian.
The influence of partial tin replacement with the transition metals Me (M=Mn Cr, Fe, Ni, Co) on physical properties of SnTe was researched for the first time. It is determined, that in all five replacements the maximum thermo-EMF is discovered at a $x=0.02$ composition, but further increase of the content in solid solutions leads to the decrease of thermo-EMF monotonously, that can be explained by decrease of the Fermi energy. A similar regularity is discovered in the current carrier concentration dependencies on the composition at room temperature. (7 refs.)

72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

102444 Transport properties of highly excited semiconductors. G.Mahler (Inst. fur Theoretische Phys., A. Forchel, Univ. Stuttgart, Stuttgart, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.875-80 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
It is shown that under specific stationary excitation conditions in surface excited semiconductors, spatial regions of 'inverse diffusion' may be created, in which the particle-hole current flows in the direction of increasing density. The cross-over to normal diffusion is directly related to experimental observations. (5 refs.)

102445 The quantum magnetic size effect in cylindrical conductors. S.S.Nedorezov (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.417-18 (25 July 1983).
Quantum magnetic size oscillations of the electron characteristics of cylindrical conductors are associated with the Fermi surface anisotropy. The oscillations predicted may be a source of important information of the electron energy spectrum of conductors. (3 refs.)

102446 Optical properties of fast-diffusion solid-state plasmas. A.Forchel, H.Schweizer (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), G.Mahler.
Phys. Rev. Lett. (USA), vol.51, no.6, p.501-4 (8 Aug. 1983).
Transmission and emission spectra of fast-diffusing nonequilibrium electron-hole plasmas in semiconductors are calculated with use of displaced Fermi distributions. The carrier drift significantly alters the plasma spectra and removes previously reported incomprehensible discrepancies between experimental and theoretical plasma parameters, indicating the necessity to reinterpret entirely the spectroscopic data from nonequilibrium plasmas. (16 refs.)

102447 Phenomenological theory of drift characteristics and high-frequency mobility of superlattices. V.A.Malyshev (Tagan Rog Radiotech. Inst., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.779-82 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1080-4 (Sept. 1982).
In the framework of one-dimensional phenomenological analysis of the drift and heating equations in the limits of the miniband, the author obtains and analyzes the relations which determine, in a generalized form, the drift characteristic and the complex high-frequency small-signal mobility of superlattices, without specifying the dispersion law. 72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

102448 Photovoltaic effect in sensitized crystal violet dyes. G.D.Sharma, A.K.Tripathi, S.C.Mathur, D.C.Dube (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.433-6 (Aug. 1983).
The authors studied the photovoltaic effect in sensitized and pure crystal violet dye using conducting glass/sensitizer/dye/metal electrode systems. It is shown that the carrier generation during photoexcitation takes place at the dye-sensitizer contact. (6 refs.)

102449 About negative residual photoconductivity of indium-selenide single crystals. A.Sh.Abdinov, Ya.G.Gasanov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.80-4 (1982). In Russian.
The spectral distribution, temperature, light intensity and field dependence of negative residual photoconductivity in indium-selenide single crystals are investigated. The results are explained on the basis of two-barrier models. (9 refs.)

102450 Some peculiarities of V-A characteristics of selenium single crystals under illumination. A.I.Isaev, D.Sh.Abdinov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.78-82 (1982). In Russian.
Volt-ampere characteristics of hexagonal selenium single crystals at 77K illuminated by light of various intensity and wavelength were experimentally investigated. It is discovered, that the illumination of the samples with the light of 0.64-0.78 μm wavelength leads to generation of low frequency current, when a constant electric field applied to sample exceeds some critical value. (8 refs.)

102451 Temperature dependent light induced conductivity changes in hydrogenated amorphous silicon. Jin Jang (Dept. of Phys., Kyung Hee Univ., Seoul, Korea), Choochon Lee.
J. Appl. Phys. (USA), vol.54, no.7, p.3943-50 (July 1983).
The light induced changes for undoped and phosphorus doped hydrogenated amorphous silicon films deposited by DC glow discharge decomposition have been studied. It is observed that the conductance change after illumination is large for the undoped films deposited near the cathode, and deposited with high silane flow rate. The 0.1%-0.5% phosphorus doped samples show the increase of dark- and photoconductance after illumination. The rate of dark- and photoconductance change are observed to be accelerated as the temperature during the illumination is elevated. The activation energies for the recovery of the conductance changes are observed to be 1.5 and 1.0 eV for undoped and 0.1% phosphorus doped films, respectively. The field effect measurements for 0.1-μm-thick undoped *a*-Si:H film before and after the illumination show that the gap state density is not changed after illumination. The results are explained on the basis of material heterogeneity. The trapping regions, considered to be contained in tissue, should be assumed to exist in the material to explain the results. The transfer of electrons (or holes for *p* type samples) between islands and the trapping regions give rise to the light induced changes in conduction. (25 refs.)

102452 Magnetic-impurity oscillations in gallium arsenide. V.N.Zverev (Inst. of Solid State Phys., USSR).
JETP Lett. (USA), vol.37, no.2, p.109-12 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.89-92 (20 Jan. 1983).
Oscillations that are periodic in the inverse magnetic field, which are due to inelastic scattering of electrons by neutral excited donors, were observed while studying low-temperature photoconductivity of *n*-GaAs. (4 refs.)

102453 The influence of triazaindolisine on the microwave photoconductivity of AgBr emulsion grains. F.Callens, W.Maenhour-Van Der Vorst (Lab. voor Kristallografie en Studie van de Vaste Stof, Rijksuniversiteit Gent, Gent, Belgium).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K47-52 (16 July 1983).
Triazaindolisine (TAI) is a well-known stabilizing agent in photography. The role of a stabilizer is to retard sensitometric change during storage. The authors report on photoconductivity measurements of AgBr emulsions with and without addition of TAI. The difference between the (100) and (111) orientation, and the interaction between the ionic conductivity and the photoconductivity is confirmed. (7 refs.)

102454 Intramolecular charge transfer complexes. XXI. Photoconductivity in N(2-hydroxyethyl) carbazolyl methacrylate-methacryloyl-β-hydroxyethyl-3,5-dinitrobenzoate copolymers. C.I.Simionescu, V.Barboiu, M.Grigoras ('P.Poni' Inst. of Macromolecular Chem., Jassy, Rumania).
Polym. Bull. (Germany), vol.9, no.10-11, p.537-42 (April 1983).
The photoconductivity was studied on donor-acceptor copolymers of various compositions. The measurements were carried out on pellet samples in which the charge carriers were continuously injected by a shallow illumination with a xenon lamp. It was found that the photoconductivity decreases with the

acceptor unit content increase, two relative maxima being however evidenced at 25-35% and 60-70% respectively. It was supposed that the two maxima are due to the dependence of the drift mobility on the copolymer composition. It was observed that the polarity of voltage applied across the samples has a minor effect on the conductivity measurements. (9 refs.)

102455 Photoconductivity and dark conductivity of hydrogenated amorphous silicon. W.Beyer (Institut fur Grenzflachenforschung und Vakuumphysik, Kernforschungsanlage Julich, Julich, Germany), B.Hoheisel.
Solid State Commun. (USA), vol.47, no.7, p.573-6 (Aug. 1983).
The study of plasma-deposited hydrogenated amorphous silicon films prepared in various deposition systems and under the use of different gases (SiH_4, SiD_4, Si_2H_4) shows a unique correlation between the photoconductivity and the dark conductivity of undoped and lightly doped films grown under optimized conditions. Deviations from this relation occur at high doping levels, in particular for boron doping, as well as upon annealing. They are attributed to an increased density of gap states due to hydrogen depletion. (27 refs.)

102456 Exciton-induced photoemission from extrinsic surface states: NaI. L.Ernst (Kaliforschungs-Inst., Kali und Salz AG, Hannover, Germany).
Surf. Sci. (Netherlands), vol.130, no.1, p.155-62 (July 1983).
Spectral photocurrents emitted by NaI(001) crystal faces subsequent to air and ultrahigh vacuum cleavage have been measured in the near-ultraviolet excitation region at room temperature. On the air-cleaved face, on which a hydrate layer forms, a broad surface state band exists within the energy gap with an upper edge at about 3.5 eV below the vacuum level. In general the major part of the states are empty, but may be filled by illuminating the sample at a wavelength corresponding to the lowest exciton peak: excitons can decay by dissociation at the surface, populating empty surface states. The excitons may also release photoelectrons, presumably from imperfections of the crystal samples used in the experiments. These photoelectrons lead to an enhancement of the photocurrent at $h\nu > 5.1$ eV. (14 refs.)

102457 Models of photogeneration in amorphous selenium. V.J.Gaidelis (Vilnius Sci. Res. Inst. of Electrography, Vilnius, Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.82-7 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.109-16 (1982).
A comparison is made of the available experimental data regarding the photogeneration quantum yield in amorphous Se in amorphous Se with two theoretical models: the Onsanger model and the jump photogeneration model. It is shown that the experimental data for amorphous Se obtained by condensation onto cold substrates (20°C) in the region of fields less than 5×10^4 V/cm are not in agreement with the Onsanger model in either the case of an initial pair distribution characterized by one value of the initial distance between carriers or the case of exponential pair distribution with respect to distances. Analytic expressions are obtained for the quantum yield as a function of field strength for the jump model of photogeneration. It is shown that the jump model is in good agreement with the experimental data over the entire range of fields investigated, at exciting light wavelengths from 450 to 620 nm. (13 refs.)

102458 Light-induced effects in amorphous silicon material and devices. D.E.Carlson, A.R.Moore, D.J.Szostak, B.Goldstein, R.W.Smith, P.J.Zanzucchi, W.R.Frenchu (RCA Labs., Princeton, NJ, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.19-23 (June-July 1983).
The authors have studied the stability of hydrogenated amorphous silicon (a-Si:H) using several new techniques such as diffusion length measurements, photovoltage profiling and IR absorption via multiple internal reflections. They find that prolonged illumination generally causes a decrease in the diffusion length and an increase in the space charge density of undoped a-Si:H films. (9 refs.)

102459 Staebler-Wronski effects in hydrogenated amorphous $Si_{1-x}Ge_x$. G.Nakamura, K.Sato, Y.Yukimoto (Semiconductor Res. & Dev. Dept., Mitsubishi Electric Corp., Itami, Japan).
Sol. Cells (Switzerland), vol.9, no.1-2, p.75-84 (June-July 1983).
Photo-induced defects in hydrogenated amorphous silicon (a-Si:H) and hydrogenated amorphous $Si_{1-x}Ge_x$ (a-$Si_{1-x}Ge_x$:H) created by prolonged light exposure and their effect on opto-electronic properties are studied. The nearly constant carrier lifetime in a-$Si_{1-x}Ge_x$:H with increasing germanium content shows that the states created by germanium dangling bonds in as-deposited a-$Si_{1-x}Ge_x$:H are situated near midband and that the spread of their distribution within the band gap may be small compared with that of the photoinduced metastable defect states. A relatively small Staebler-Wronski effect is observed in a-Si_{1-xGx}:H. However, the density of photoinduced states in a-$Si_{1-x}Ge_x$:H is of about the same order of magnitude as that in a-Si:H. The reason for this seems to be that the large density of states created by germanium dangling bonds masks the effect of light-induced defects. (15 refs.)

102460 The effect of light soaking on the low temperature photoconductivity of hydrogenated amorphous silicon. P.E.Vanier (Div. of Metall. & Materials Sci., Brookhaven Nat. Lab., Upton, NY, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.85-93 (June-July 1983).
Exposure of intrinsic and lightly doped glow discharge hydrogenated amorphous silicon to white light at an intensity of about 100 mW cm^{-2} for several hours (light soaking) induces changes in the temperature dependence of the photoconductivity. These changes which can be reversed by heating to 200°C are different for samples with different Fermi levels E_F but can in each case be explained by an increase in the density of states in the lower half of the gap. These states are different from the states 1 and 2 previously inferred from the temperature dependence of the photoconductivity. For E_F near midgap, no increase in the density of dangling bonds is seen after light soaking. The behavior of slightly n-type samples can be explained by shifts of E_F and the resulting changes in occupation of existing dangling bonds. In p-type samples, increased recombination probably occurs through the light-induced states, which are not dangling bonds. (14 refs.)

102461 The interpretation of photoconductivity measurements in hydrogenated amorphous silicon. W.Pickin (Inst. de Investigaciones en Materiales, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Sol. Cells (Switzerland), vol.9, no.1-2, p.95-111 (June-July 1983).
A theory of steady state photoconductivity in trap-dominated materials is formulated in terms of a recombination rate that is an integral of Shockley-Read terms and a global charge neutrality condition that involves the occupation statistics of hole and electron traps. Application of the theory to hydrogenated amorphous silicon is complicated by lack of necessary data, especially on transition rates between band and trap, and various assumptions for these are used to derive the recombination rate. Weak assumptions for the transition rates, coupled with asymmetry in the gap density of states in this material, lead to a simple description of the electron trap statistics. This simplicity allows a relationship to be established between the photoconductive response time and the gap density of states. Various experiments on photoconductivity and its response time are analysed in these terms. Possible origins for light-induced changes in photoconductivity in hydrogenated amorphous silicon are considered. (21 refs.)

102462 Origin of the photo-induced changes in hydrogenated amorphous silicon. D.Adler (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.133-48 (June-July 1983).
The electronic properties of hydrogenated amorphous silicon films are discussed in detail. Particular attention is paid to the changes induced by photogeneration of excess free carriers. Previous models which have been proposed to account for such effects are classified and criticized. An alternative explanation, which is based on the unique electronic structure of hydrogenated amorphous silicon, is proposed and analyzed. In this model, no new defects are created by the light, but rather the photo-induced effects follow from a metastable trapping of the excess free carriers at charged spinless defects which are present at equilibrium. (45 refs.)

102463 Optoelectronic characterization of undoped amorphous silicon thermistor. M.Sameh Said (Dept. of Electrical Engng., Univ. of Toledo, Toledo, OH, USA).
23rd Midwest Symposium on Circuits and Systems, Toledo, OH, USA, 4-5 Aug. 1980 (North Hollywood, CA, USA: Western Periodicals 1980), p.238-41
Photoconductive studies are linked with electrical conductivity measurements in forming a transport model in a-Si bulk conductor. Reproducibility tests show its validity as a thermistor up to 70°C. (29 refs.)

102464 On the spectral response of undoped amorphous silicon photoconductor. M.Sameh Said (Dept. of Electrical Engng., Univ. of Toledo, Toledo, OH, USA).
23rd Midwest Symposium on Circuits and Systems, Toledo, OH, USA, 4-5 Aug. 1980 (North Hollywood, CA, USA: Western Periodicals 1980), p.242-5
The absorption edge of amorphous silicon is studied by using the spectral photoconductivity technique in different sets of silane pressure. Increased silane pressure shifts the absorption edge to higher energy. A physical explanation of this result is presented. (23 refs.)

72.50 ACOUSTOELECTRIC EFFECTS

102465 Acoustic second harmonic generation in piezoelectric semiconductors: Effect of nonuniform electric field intensity. P.Palanichamy, S.P.Singh (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
J. Appl. Phys. (USA), vol.54, no.7, p.3958-64 (July 1983).
Acoustic second harmonic generation is studied theoretically in nondegenerate piezoelectric semiconductors in the presence of DC electric field longitudinal to the direction of propagation of the acoustic wave. The static electric-field intensity and the carrier concentration inside the semiconductor are taken as nonuniform even in trap-free samples. This assumption used in the authors' theory modifies the results obtained by the earlier theories considerably. It is also found that the power thus calculated for the second harmonic flux in terms of the power associated with the fundamental flux is enhanced. Comparison with the available experimental results shows a qualitative agreement. The authors have used the phenomenological theory and that restricts their analysis to the low frequency region. (17 refs.)

102466 Comparative study of surface acoustic wave and photocurrent spectroscopies in GaP. I.J.Fritz (Sandia Nat. Labs., Albuquerque, NM, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4457-62 (Aug. 1983).
Optical-excitation spectra of several GaP samples have been obtained using transverse acoustoelectric spectroscopy in the separated-medium surface-wave configuration. The results are compared with data obtained on the same samples using photocurrent spectroscopy of Au Schottky-barrier diode structures. Despite differences in the two measurement techniques, the observed spectral features are quite similar, and these features are in good agreement with photocurrent, photoconductivity, surface-wave and optical-absorption data in the literature. Both techniques are useful for probing the near-surface properties of semiconductors. However, the surface-wave technique, which is newer and less widely utilized, has an advantage in not requiring electrical contact to the sample. The surface-wave technique thus can provide quick, nondestructive characterization of photoexcitation processes in epitaxial layers and surface-modified regions of semiconductors. (14 refs.)

102467 Transverse acousto-EMF as a function of acoustically stimulated adsorption on the surface of a semiconductor. A.J.Jucys, R.N.Giriuniene, E.P.Garska (Kapsukas Vilnius State Univ., Vilnius, Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.77-81 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.102-8 (1982).
In a laminar-$LiNbO_3$-CdS structure with a gap, the acoustically stimulated adsorption of electron-acceptor particles from the gas phase on the surface of semiconductor CDS has been investigated. By measuring the transverse acousto-EMF, contact-free monitoring by means of acoustic surface waves (ASW) of the evolution of the electrical properties (conductivity, photosensitivity, capacitance) of the CdS surface in the process of acoustically stimulated adsorption is possible. Measurements of the behavior of the transverse acousto-EMF establish that the ASW in a mode of continuous generation (CG) alter the adsorption rate, the adsorptivity of the surface, and the relationship between the reversible and irreversible forms of chemisorption. It is shown that acoustically stimulated adsorbed promotes a substantial change in the surface conductivity, photosensitivity, and surface capacitance. The results are explained on the basis of the electron theory of chemisorption and acoustoelectronics. (11 refs.)

72.55 MAGNETOACOUSTIC EFFECTS

102468 Size magnetoacoustic effect for shear waves in metals. V.M.Gokhfel'd, V.G.Peschanskii (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1066-9 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A calculation is made of the absorption coefficient Γ of a transverse acoustic wave propagating across a thin ($0 \leq z \leq d$) metal film along the direction of an external magnetic field H. The relative magnitude of the oscillations of $\Gamma(H,d)$ is considerably greater than in the case of longitudinal acoustic vibrations and, together with the smooth part of Γ, it rises steeply under conditions of acoustic generation of a helical electromagnetic wave. (7 refs.) *A.T.*

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

102469 Electrical conductivity and high resolution electron microscopy studies of WO_{3-x} crystals with $0 \leq x \leq 0.28$. W.Sahle, M.Nygren (Dept. of Inorganic Chem., Univ. of Stockholm, Stockholm, Sweden).
J. Solid State Chem. (USA), vol.48, no.2, p.154-60 (1 July 1983).
WO_{3-x} crystals with $0 \leq x \leq 0.28$ have been studied by means of HREM and electrical conductivity measurements. Semiconducting behavior with and E_a of the order 0.06 eV was observed for crystals which, according to the HREM study, contained {102} *CS* planes ($x \simeq 0.03$). Plots of conductivity vs. $1/T$ for WO_3 and WO_{3-x} containing disordered {102} *CS* planes are also presented. Metallic behavior was found for crystals with ordered {103} *CS* planes ($x \simeq 0.11$), for $W_{12}O_{34}$ ($x=0.167$), and for $W_{18}O_{49}$ ($x=0.28$). (26 refs.)

102470 Preparation and properties of $La_{1-x}CoO_3$ ($0.2 \leq x \leq 0.6$). I.F.Kononyuk, S.P.Tolochko, V.A.Lutsko, V.M.Anishchik (Inst. for Phys. & Chem. Res., Byelorussian State Univ., Minsk, USSR).
J. Solid State Chem. (USA), vol.48, no.2, p.209-14 (1 July 1983).
The preparatory conditions for the oxide compositions $La_{1-x}Ca_xCoO_{3-\delta}$ have been determined along with their crystallographic, thermochemical, and electrical properties. Single phase solid solutions of the perovskite structure form at $x<0.6$. It has been established that the compounds obtained in the open air atmosphere are oxygen deficient, the deficit increasing with x and temperature. The specific resistivity at $x=0.2$-0.6 is $(1\text{-}2) \times 10^{-3}$ ohm.cm; it increases with the concentration of oxygen vacancies. At $0.3 \leq x \leq 0.6$ the *p*-type conductivity is metallic in character with low temperature resistivity coefficients of the order $(1\text{-}5) \times 10^{-4}$ K^{-1} in the interval 20-700°C. (13 refs.)

102471 Effect of hydrogen pressure on the nature of the conductivity of solid lithium hydride. V.B.Ptashnik, T.Yu.Dunaeva, Yu.M.Baikov (A.F. Ioffe, Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1186-90 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1335-9 (Oct. 1982).
The component conductivities in the electrolysis of solid lithium hydride have been determined in the 200-680°C temperature range. The transference number of the ions has been obtained as a function of temperature. In the low-temperature region, p-type conductivity predominates; n-type predominates in the high temperature region. The kinetics of hydrogen absorption by lithium hydride in the absence of a current was determined by the reaction of gas phase hydrogen with a thin film of metallic lithium. (16 refs.)

72.70 NOISE PROCESSES AND PHENOMENA

102472 Thermal noise in insulator diode with traps lying below the Fermi level under CDDM regime. V.S.Raghav, Y.K.Sharma, C.S.Agarwal (Dept. of Phys., RBS Coll., Agra, India).
Curr. Sci. (India), vol.52, no.9, p.404-7 (5 May 1983).
The effects of space charge and traps on the thermal noise in one carrier insulator diode with traps lying below the Fermi level have been studied using the regional approximation method. The mobility of the current carriers is proportional to the carrier density. The noise is highly suppressed by the space charge present in the device. (12 refs.)

102473 Two-point correlations of diffusion noise sources of hot carriers in semiconductors. J.P.Nougier, J.C.Vaissiere, C.Gontrand (Centre d'Electronique de Montpellier, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Phys. Rev. Lett. (USA), vol.51, no.6, p.513-16 (8 Aug. 1983).
The authors show that, contrary to the usual assumption, the local noise sources at two different points are not uncorrelated, but indeed are correlated over short distances, of the order of magnitude of a fraction of a micrometer. The two-point correlation function is expressed for hot carriers in semiconductors when randomizing scatterings are involved. The expression of the frequency-dependent diffusion coefficient for hot carriers is given as an explicit integral form involving the distribution function. (8 refs.)

102474 Noise spectroscopy in amorphous silicon films. J.C.Anderson (Dept. of Electrical Engng., Imperial Coll. of Sci. & Technol., London, England).
Philos. Mag. B (GB), vol.48, no.1, p.31-45 (July 1983).
Electrical noise due to trapping and detrapping of electrons in hydrogenated a-Si:H films is a potential source of information on trapping densities, energy and transport parameters. In this paper the noise signal is analysed by sampling, auto-correlation and Fourier transformation, in terms of 'noise spectroscopy'. Chemical rate theory has been used to derive 'attempt-to-escape' frequencies. For intrinsic films, values for the trap density and the temperature coefficient of the activation energy are obtained. For doped films, trap density, hopping activation energy and mobility values are obtained. Limited experimental results for an intrinsic and n-type film are reported and are found to be in fair agreement with values given in the literature. (13 refs.)

72.90 OTHER TOPICS IN ELECTRONIC TRANSPORT IN CONDENSED MATTER

102475 Tensor of effective electrical conductivity for medium with two-layer particles of dispersed phase. V.I.Popov.
Magnetohydrodynamics (USA), vol.18, no.4, p.395-8 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.76-8 (Oct.-Dec. 1982).
In real heterogeneous media the particles of the dispersed phase are usually covered with sheaths of either surface-active substances (in emulsions and in suspensions) or oxides (in alloys and in mixtures of liquid metals), or simply constitute two-layer particles. Since the characteristics of these sheaths (electrical conductivity, dielectric permittivity, magnetic permeability, thermal conductivity) differ from the characteristics of the carrier phase and of the dispersed phase, they can appreciably affect the effective generalized electrical conductivity of the entire heterogeneous medium. The author determines the tensor of effective electrical conductivity for uniform steady heterogeneous medium. (3 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

102476 Theory of surface core-level shifts in metals. B.Johansson (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), N.Martensson.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.405-26 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
From the complete screening picture for the core electron ionization process in a metal, a theoretical expression for the surface core-level binding energy shift is derived. By means of the equivalent core approximation this expression is evaluated for the 5d transition metal series and comparisons with experiment are made. Surface core-level shifts are shown to be related to the surface heat of segregation of a substitutional (Z+1) impurity, and are calculated to depend on the surface crystal plane. Also the possibility of valence changes at the surface of rare-earth metals is briefly treated. (61 refs.)

102477 Electronic properties of interfaces. J.Pollman (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.493-504 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Some fundamental microscopic electronic properties of vacuum-semiconductor, metal-semiconductor and semiconductor-semiconductor interfaces are discussed in connection with the question of their meaning for macroscopic transport properties of junction devices. (35 refs.)

102478 Surface state density determination based on conductance approximation methods. R.J.Singh (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.354-6 (June 1983).
Amongst different approximate methods for the determination of interface state density at the Si-SiO_2 interface, the Hill and Coleman (1980) method is found to be the most suitable one. Results obtained from various samples having surface state density of varying magnitudes computed by three different methods are compared to support this conclusion. (9 refs.)

102479 Valley splitting on tilted Si(100) surfaces. S.M.Goodnick, J.R.Sites, K.S.Yi, D.K.Ferry, C.W.Wilmsen (Colorado State Univ., Fort Collins, CO, USA).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.111-13 (15 Aug. 1983).
Investigates Shubnikov-de Haas (SdH) oscillations and Hall measurements in the inversion layer of surfaces tilted 1.2° from the Si(100) towards the Si(111). SdH measurements reveal two distinct bands, populated approximately in a 4:1 ratio, each with a valley degeneracy of one, which is consistent with valley splitting in a projection model. (15 refs.)

102480 Dynamical image potential of a slowly moving electron: effects of spatial dispersion and boundary conditions at the image plane. W.Ekardt (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Phys. Rev. B (USA), vol.28, no.2, p.1099-102 (15 July 1983).
The effect of spatial dispersion on the dynamical nonlocal image potential of a slowly moving electron is studied within a hydrodynamiclike model. It is shown that, for energies below the surface-plasmon-emission threshold spatial dispersion effects and dynamical effects are of equal importance. Compared with this, the use of the surface Green's function instead of the free-particle Green's function in calculating the nonlocal self-energy is only of minor importance. (12 refs.)

102481 Absorption of ballistic phonons by the (001) inversion layer of Si: electron-phonon interaction in two dimensions. J.C.Hensel, R.C.Dynes, D.C.Tsui (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1124-6 (15 July 1983).
The authors report the observation of absorption as a function of electron density of ballistic phonons in the two-dimensional electron gas in the (001) inversion layer of Si. Remarkably, the strength of the absorption is found to be an order of magnitude greater than can be explained by a conventional absorption model based on electron scattering in two dimensions and a deformation-potential electron-phonon interaction characteristic of bulk Si. (6 refs.)

102482 Many-body effects on the subband structure of *n*-type surface space-charge layers in InP. K.S.Yi, D.K.Ferry (Dept. of Electrical Engng., Colorado State Univ., Fort Collins, CO, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1127-9 (15 July 1983).
The effects of both the direct and the polar LO-phonon mediated electron-electron interactions are included in a calculation of the many-body effects on the subband structure of InP. The results show that the effects of exchange and correlation among surface electrons are not negligible. The dominant contribution to electronic self-energy correction comes from the direct electron-electron interaction. The threshold densities of higher-subband occupancy are determined and compared with existing models and experiments. (14 refs.)

102483 Core- and valence-band energy-level shifts in small two-dimensional islands of gold deposited on Pt(100): the effect of step-edge, surface, and bulk atoms. M.Salmeron, S.Ferrer, M.Jazzar, G.A.Somorjai (Molecular & Materials Res. Div., Lawrence Berkeley Lab., Berkeley, CA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1158-60 (15 July 1983).
Photoemission techniques were used to study the electronic properties of two-dimensional islands of Au deposited on Pt(100) in the submonolayer range. Shifts of approximately 0.6 eV were observed in both valence-band and core-level binding energies for $\Theta=1$ to 0.1. These shifts are interpreted in terms of the increasing proportion of island edges as the gold coverage approaches zero. Above $\Theta=1$ the surface-bulk energy shift was found to agree with previously published data. (10 refs.)

102484 Comparison of image-potential theories. A.Puri, W.L.Schaich (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1781-4 (15 Aug. 1983).
The authors study a simple model which contains the basic physics of the image-potential problem but which allows a nearly exact solution. The predictions of this numerical solution are compared to those of various approximate theories that have been recently proposed. The authors find no support for the suggested anomalies; conventional image-potential theory appears to be adequate. (14 refs.)

102485 Angle-resolved photoelectron spectroscopy of II-VI compound semiconductors. III. Study of surface states of CdTe (110). S.Takano, H.Koinuma, S.Asami, A.Ebina, T.Takahashi.
Rec. Electr. & Commun. Eng. Conversazione Tohoku Univ. (Japan), vol.52, no.1, p.1-5 (June 1983). In Japanese.
For pt.II see ibid., vol.51, no.1, p.26-31 (1982). Electronic surface states of a cleaved CdTe (110) surface were studied with angle-resolved photoemission spectroscopy (ARUPS) using a HeI resonance line. Surface electronic states were distinguished from bulk electronic states by a so-called contamination test: the state which changes in intensity with adsorption of oxygen is identified as a surface state. Thus the dispersion of the surface state was determined along the Γ-X, and the Γ-*X* symmetry lines. It was found that the uppermost occupied surface state locates below the valence band maximum. 73.25 SURFACE CONDUCTIVITY

102486 Electrical conductivity of a low-temperature two dimensional medium. B.M.Vul, E.I.Zavaritskaya, V.N.Zavaritskii (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.2, p.105-8 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.87-9 (20 Jan. 1983).
The surface conductivity $\sigma_\square$ of the (111) face of a germanium crystal has been studied over the temperature (T) interval from 1.2 to 4.2K. At $\sigma_\square \lesssim (e^2/h)$ the surface conductivity $\sigma_\square$ varies in proportion to $\exp(-\varepsilon/kT)$, where e is the electron charge, h is the Planck constant, and ε is the activation energy. At $\sigma_\square \gtrsim (e^2/h)$ the behavior of the conductivity is described by $\Delta\sigma=\sigma_\square(T_1)-\sigma_\square(T)\simeq(e^2/4h)\ln(T_1/T)$ as the temperature is lowered from $T_1=4.2K$ to 1.2K. In the transition region the $\sigma_\square(T)$ dependence agrees quite well with both descriptions. (4 refs.)

102487 Classical magnetoresistance of a two-dimensional electron gas in a one-dimensional superlattice. G.M.Gusev, Z.D.Kvon, V.N.Ovsyuk (Inst. of Phys. of Semiconductors, Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.4, p.210-12 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.177-9 (20 Feb. 1983).
The magnetoresistance due to restructuring of the Fermi surface of electrons under the action of a one-dimensional superlattice has been predicted and observed in a degenerate two-dimensional electron gas on a high-index surface of silicon. The effect is sharply anisotropic and can be used as a new method for investigating the indicated system. (6 refs.)

102488 Dark relaxation of surface charge of an organic photosemiconducting layer. G.N.Ganco, E.B.Mockus, N.A.Fedorova (Vilnius Sci. Res. Inst. of Electrography, Vilnius, Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.67-76 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.89-101 (1982).
Investigates dark relaxation of nonuniform surface charge using the example of an organic photosemiconducting layer (OPL) of polyepoxypropylcarbazole. Surface drift of carriers is determined on the basis of spreading of the nonuniform surface charge of the OPL created by photodischarge of the OPL under nonuniform illumination. This procedure makes it possible to estimate small values of the surface mobility, less than 10^{-10} $m^2/(V.sec)$, that are characteristic of organic photosemiconductors. A substantial change in OPL properties after holding in darkness in a charge state is established. On the

basis of an analysis of various mechanisms of surface phenomena, a physical model is proposed that accounts for the experimental findings. In accordance with the model, in a surface region 20-40 Å deep of the OPL a surface polarization barrier arises, due to dipole-segment relaxation, and orientation of carbazole rings and other polar groups in a strong electric field. For the surface mobility of holes the estimate $(10^{-9}\text{-}10^{-12})$ $m^2/(V.sec)$ is obtained, while for the mobility of adsorbed ions it is less than 10^{-16} $m^2/(V.sec)$. (20 refs.)

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

102489 The temperature dependencies of parameters of metal-*p*-GaAs Schottky diodes. A.B.Medzhidov, F.N.Sultanov, B.G.Tagiev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.83-5 (1982). In Russian.
An investigation of the temperature dependence of volt-ampere characteristics and $C^{-2}=f(U)$ for metal-*p*-GaSe Schottky diodes has been made. The temperature coefficients for the barrier height and cut-off voltage have been determined. The changes in the direct and reverse currents of diodes versus temperature are likely to be connected with thermal generation of current carriers. (5 refs.)

102490 Pile up of implanted phosphorus during palladium silicide formation and the characteristics of Schottky barrier diodes. A.Kikuchi (Central Res. Lab., Hitachi, Ltd., Tokyo, Japan).
J. Appl. Phys. (USA), vol.54, no.7, p.3998-4000 (July 1983).
Schottky barrier diodes are fabricated on silicon surfaces whose impurity concentrations are controlled by ion implantation of phosphorus. The barriers are produced from Pd_2Si or Al-Si. The forward voltages fo Schottky barrier diodes made from Pd_2Si show a much greater lowering than those made from Al-Si for implanted doses of 5×10^{13} cm^{-2} and higher. Spreading resistance measurements show that the implanted phosphorus atoms are piled up at the Pd_2Si-Si interface during Pd_2Si formation. This causes reduction in the effective barrier height. (6 refs.)

102491 Al-GaAs(001) Schottky barrier formation. S.P.Svensson, G.Landgren, T.G.Andersson (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
J. Appl. Phys. (USA), vol.54, no.8, p.4474-81 (Aug. 1983).
Schottky diodes have been fabricated by in situ deposition of Al on GaAs (001) grown by molecular beam epitaxy. A detailed study of the Schottky barrier height (ϕ_b) dependence on surface geometry and composition has been undertaken. Reconstructed, as well as very As- and very Ga-rich surfaces have been prepared. For comparison also samples with a thin interfacial AlAs layer were produced. The barrier height was determined by the capacitance-voltage (*C-V*) and current-voltage (*I-V*) techniques. The quality of the material was controlled by deep level transient spectroscopy revealing a total concentration of levels in the upper part of the band gap in the mid 10^{12} cm^{-3} range. Measuring the barrier heights of different diodes across a wafer showed lateral variations which were preserved also after annealing. A number of possible explanations for these variations were investigated but none proved satisfactory. Averaging over a large number of diodes revealed no apparent reconstruction dependence of the barrier height. The two measurement techniques gave the same barrier height $\phi_b\approx0.75$ eV. By defining the Auger As (MVV)/Ga(MMM) signal ratio as a measure on the surface composition it was found that reconstructed surfaces appeared in the interval $2<As/Ga<5$. Going outside this interval the barrier increased for $As/Ga<2$ and decreased for $5<As/Ga<10$. For $As/Ga>10$ an increase was again found. Annealing at 573K led to a rapid initial increase of the barrier height for the samples with reconstructed GaAs surfaces followed by a slower interdiffusion related increase during prolonged annealing. (28 refs.)

102492 Degradation mechanism of $Mo/GaAs_{0.6}P_{0.4}$ Schottky barriers. J.C.Lou, M.S.Lin, W.H.Su (Dept. of Electrical Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Appl. Phys. (USA), vol.54, no.8, p.4482-9 (Aug. 1983).
The electrical characteristics and interdiffusion in electron-beam evaporated $Mo/GaAs_{0.6}P_{0.4}$ Schottky barriers have been studied. The barrier height, ideality factor and deep trapping levels of these annealed or unannealed $Mo/GaAs_{0.6}P_{0.4}$ Schottky barriers are obtained by using the *I-V*, *C-V*, Rutherford backscattering spectroscopy (RBS), Auger electron spectroscopy (AES), and deep level transient spectroscopy (DLTS) analyses. A significant interdiffusion at the $Mo/GaAs_{0.6}P_{0.4}$ interface is demonstrated for 500°C, 600°C, annealed Schottky barriers. DLTS results show that there are two electron traps [$E_c-(0.19\pm0.01)$ eV and E_c-(0.65 ± 0.01) eV] and five hole traps [$E_v+0.15$ eV, $E_v+(0.27\pm0.01)$ eV, $E_v+(0.36\pm0.02)$ eV, $E_v+(0.56\pm0.01)$ eV and $E_v+0.84$ eV] in existence at the metal-semiconductor interface or in the bulk of the degraded Schottky barriers. These traps enhance the generation-recombination effect and degrade the barrier height. RBS, AES, and DLTS results also indicate that the newly discovered hole trap $E_v+0.84$ eV, induced by Mo indiffusion, is believed to play a major role for $Mo/GaAs_{0.6}P_{0.4}$ Schottky barriers degradation. (30 refs.)

102493 Work-function calculations for a symmetrical total-charge-density profile at the metallic surface. K.F.Wojciechowski, M.Sobanska-Nowotnik (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland).
Phys. Rev. B (USA), vol.28, no.2, p.1105-8 (15 July 1983).
It is shown that, if the total-charge-density profile $n_T(x)$ at the surface of jellium satisfies the Budd-Vannimenus constraint and also is a symmetrical function of x, relative to the ordinate axis, then the work-function variation versus the Wigner-Seitz radius r_s does not depend on the form of $n_T(x)$. Also the simple linear-density profile is used to calculate the work function by application of the variational principle for the energy, including the first and second density-gradient corrections to the kinetic energy and the first gradient correction to the exchange and correlation energy. The results for the work function are in good agreement with the polycrystalline values for low-density metals. (22 refs.)

102494 Point-contact spectroscopy. A.G.M.Jansesn, A.P.van Gelder, A.M.Duif, P.Wyder, N.d'Ambrumenil (Res. Inst. for Materials, Univ. of Nijmegen, Nijmegen, Netherlands).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.209-22 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Point contacts between metals show deviations from Ohm's law, which are used for a spectroscopic analysis of the scattering of electrons in a metal. A theoretical model is presented for the electrical transport problem of a metallic constriction, based on the solution of the Boltzmann equation. Experiments demonstrate that the electron-phonon interaction function α^2F can be measured directly in normal metals. Other scattering mechanisms than the electron-phonon interaction can also be detected with point contacts. Examples are given for dilute alloys of metals with paramagnetic impurities. (21 refs.)

Point-contact electron-phonon interaction spectra of pure metals .... See Entry 101885

73.40L Semiconductor-to-semiconductor contacts, p-n junctions, and heterojunctions

102495 New perspective in semiconductor physics based on advanced technology. T.Porjesz (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.411-17 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Up-to-date technology provides the possibility of producing submicron semiconductor devices and higly dense device structures. The classification of the devices is based on the characteristic durations of the processes taking place in them. The dominant or the perturbative nature of the effects depends on the sizes of the system in question. The Boltzmann transport theory can fail with the decrease of dimensions. After some criticism of the fundamental assumptions the limits of the validity of the theory are marked out. The main lines of the quantum transport theory are pointed out and with the help of the superlattices very dense device arrays are described, with indications of the further development of theory and practice. (5 refs.)

102496 Compositional and doping superlattices in III-V semiconductors. K.Ploog, G.H.Dohler (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Adv. Phys. (GB), vol.32, no.3, p.285-359 (May-June 1983).
The unusual electrical and optical properties of three important types of semiconductor superlattices are reviewed. The artificial structures which were grown by molecular beam epitaxy (MBE) consist of a periodic sequence of ultrathin crystalline layers of alternating composition ($Al_xGa_{1-x}As/GaAs$ or $Ga_xIn_{1-x}As/GaAs_ySb_{1-y}$) or of alternating doping (*n*-GaAs/*p*-GaAs). The electronic energy bands in these superlattices are split into quasitwo-dimensional subbands whose spacing and width can be tailored by appropriate choice of the design parameters of the structure. After a brief outline of the electronic properties of compositional superlattices, the authors discuss the unique properties of GaAs doping superlattices in detail. The space charge induced band edge modulation in doping superlattices leads to an indirect energy gap in real space. As a consequence, the electrons and holes are spatially separated and their recombination lifetimes are strongly enhanced, i.e. non-equilibrium free-carrier distributions can be metastable. This implies the unique possibility of tuning the carrier concentration in a given superlattice sample over a wide range. (99 refs.)

102497 Field ionised impurity scattering in an AlGaAs/GaAs two-dimensional electron gas. A.Livingstone, K.Tsubaki, M.Kawashima, H.Okamoto, K.Kumabe (Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Electron. Lett. (GB), vol.19, no.16, p.619-20 (4 Aug. 1983).
Low field-mobility saturation has been observed in AlGaAs/GaAs heterostructures. Under illumination, the mobility decreases and the carrier concentration increases at high fields. Both effects are thought to be due to ionisation of a centre in the GaAs, probably oxygen. The experimental results are explained in terms of a simple trap model. (7 refs.)

102498 Applications of superlattices. N.T.Linh (Thomson-CSF Central Res. Lab., Orsay, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.361-74 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Since the first work on periodic superlattice, many studies have been devoted to heterojunction multilayers. Combinations of different material properties have led to a new class of semiconductors exhibiting interesting electronic properties. Applications in the field of quantum well lasers, two-dimensional

electron gas field effect transistors, superlattice avalanche photo-diodes are described. Conclusion is given on the tight cooperation between physicists and engineers to build up new ideas. (25 refs.)

102499 Space-charge waves in multilayered heterostructures. S.Datta, R.L.Gunshor (School of Electrical Engng., Purdue Univ., West Lafayette, IN, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4453-6 (Aug. 1983).
Space-charge waves in multilayered heterostructures are discussed using coupled Boltzmann equations. Acoustic plasma modes are investigated with practical examples. The formulation includes both degenerate and nondegenerate electron systems; exchange and correlation effects are incorporated using a local density approximation and are shown to affect the acoustic plasma mode significantly; lattice collisions are included using the relaxation time approximation. (8 refs.)

102500 Peripheral photoresponse of a *p-n* junction. H.Holloway, A.D.Brailsford (Ford Motor Corp., Dearborn, MI, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4641-56 (Aug. 1983).
A quantitative theory is presented for the enhanced photoresponse of *p-n* junctions that arises from the lateral diffusion of photogenerated carriers. This mechanism leads to a photoactive area for a photodiode that may be much larger than its *p-n* junction area. The main theory pertains to the geometry that arises with mesa diodes, the results for which are also applicable to planar junctions that are shallow when compared with the minority-carrier diffusion length. The solution for infinitely deep planar junctions is obtained by separate analysis. The magnitude of the peripheral photoresponse is sensitive to geometric and physical factors such as semiconductor thickness, surface recombination, optical absorption length, and competition for photogenerated carriers by adjacent photodiodes. The dependence of the response upon all of these features is presented. (6 refs.)

102501 Transient capacitance spectroscopy on large quantum well heterostructures. P.A.Martin, K.Meehan, P.Gavrilovic, K.Hess, N.Holonyak,Jr., J.J.Coleman (Electrical Engng. Res. Lab., Univ. of Illinois, Urbana, IL, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4689-91 (Aug. 1983).
The authors report transient capacitance measurements on $Al_xGa_{1-x}As$-GaAs-$Al_xGa_{1-x}As$ ($x \sim 0.35$) double heterojunctions with a large quantum well active region ($L_z \sim 800$ Å). It is suggested that the thin GaAs layer acts as a 'giant' artificial deep level. It follows then that the band edge discontinuity ΔE_c determines the electron emission rates (from the thin layer), thus making it possible for ΔE_c to be determined by transient capacitance measurements. (11 refs.)

102502 Growth peculiarities of graded band gap GaAsSb/GaAs heterostructures and effective light modulation in the 1.06 μm wavelength region. Yu.B.Bolkhovityanov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR), B.A.Bobylev, V.I.Korzhov, V.I.Yudaev, E.H.Hairi.
Phys. Status Solidi a (Germany), vol.78, no.1, p.343-7 (16 July 1983).
Growth features of LPE n-$GaAs_{1-x}Sb_x$/n^+-GaAs ($n \approx 10^{15}$ cm^{-3}) continuously graded composition heterostructures are investigated and the electroabsorption spectra in these heterocompositions are analysed. Franz-Keldysh light modulators are used with a modulation coefficient up to 30% in the wavelength region up to 1.06 μm. (6 refs.)

102503 Quantum oscillations in strained-layer superlattices. J.E.Schirber, I.J.Fritz, L.R.Dawson, G.C.Osbourn (Sandia Nat. Labs., Albuquerque, NM, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2229-31 (15 Aug. 1983).
Large-amplitude quantum oscillations are observed in the magnetotransport in GaAs-$Ga_{0.8}In_{0.2}As$ strained-layer superlattices. These measurements demonstrate that single-crystal perfection and high mobilities at low temperatures can be achieved in a new class of semiconductor structures. The properties of these structures can be tailored easily over a wide range inaccessible to naturally occurring lattice-matched heterostructures. (13 refs.)

73.40M Semiconductor-electrolyte contacts

102504 Photoelectrochemical study of (Ti,V)O$_2$ and (Ti,Nb)O$_2$ alloys. J.Gautron, P.Lemasson (Lab. d'Electrochimie Interfaciale, CNRS, Meudon, France), B.Poumellec, J.-F.Marucco.
Sol. Energy Mater. (Netherlands), vol.9, no.1, p.101-11 (May-June 1983).
The ceramic alloys (Ti,Nb)O$_2$ and (Ti,V)O$_2$ are studied photoelectrochemically in an aqueous electrolyte. A n-type electrical conductivity is noted for the whole composition range. The energy gaps E_g for the (Ti,V)O$_2$ alloys are 0.8 eV (VO$_2$)$<E_g<$3 eV (TiO$_2$) whereas for the (Ti,Nb)O$_2$ alloys E_g remains nearly constant and $\approx$3 eV. With an energy gap of $\approx$2 eV, the alloy $Ti_{0.4}V_{0.6}O_2$, which is electrochemically stable, seems especially attractive for solar energy conversion. However, its characteristics are counterbalanced by a too much anodic flat-band potential and by a low quantum efficiency. A correlation between the photocurrent and the associated optical transitions leads to precise band diagrams for both alloys. The study of their photoelectrochemical stability enables one to determine the nature of the optical transitions, giving rise to the photocurrent. (20 refs.)

73.40N Metal-nonmetal contacts

102505 Laser annealed ohmic contact to n^+-GaAs. P.Sircar (Dept. de Phys.-Math., Univ. de Moncton, Moncton, NB, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1218-21 (Aug. 1983).
Ohmic contacts were made on n^+-GaAs substrates by evaporating a gold-germanium eutectic film with or without a thin nickel overlayer and then alloying these samples either in a furnace or by means of an excimer laser. It is found that laser annealing gives a better surface morphology and a lower contact resistance than furnace annealing. (10 refs.)

102506 Comparison of photoelectrochemical properties of n-TiO$_2$ films obtained by different production methods. K.J.Hartig (Inst. fur Theoretische Chem. und Strahlenchem., Univ. Wien, Wien, Austria), N.Getoff, G.Nauer.
Int. J. Hydrogen Energy (GB), vol.8, no.8, p.589-96 (1983).
Semiconducting n-TiO$_2$ films on titanium metal foils were produced by controlled thermal oxidation anodic oxidation with facultative subsequent reduction with hydrogen and by vapor deposition. These samples were compared with respect to their photochemical and photophysical behavior, their electrochemical and photoelectrochemical properties and their surface structure and chemical composition. n-TiO$_2$ layers produced by controlled thermal oxidation turned out to be optimal photoanodes. (4 refs.)

102507 Al/Poly Si specific contact resistivity. J.M.Ford (Motorola Semiconductor Res. & Dev. Lab., Phoenix, AZ, USA).
IEEE Electron Device Lett. (USA), vol.EDL-4, no.7, p.255-7 (July 1983).
Experimental results on the specific contact resistivity of Al/polysilicon are given for Al/1.5-percent Si contacting poly Si implanted with boron or phosphorus, annealed to surface concentrations from 3E18 to 4E20 cm^{-3}. Specific contact resistivities of the interfaces involved were determined using an extrapolation method. Measurements were taken at room temperature, and were conducted both before and after an anneal cycle of 20 min at 450°C in forming gas. Results provide a useful parameter which enables modeling of Al/poly Si contacts. (17 refs.)

102508 Physical model and mechanism of charge-carrier transfer in tungsten silicide-silicon contacts. I.V.Belousov, V.V.Il'chenko, V.I.Strikha (T.G. Shevchenko Kiev State Univ., Kiev, Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.998-1002 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR),* vol.25, no.11, p.27-31 (Nov. 1982).
A great number of works have been devoted to the investigation of tungsten silicides at the metal-semiconductor interface. However, in these works, the physical model of the interface has not been considered, nor the reasons for the change in electrophysical properties of the structures in the formation of tungsten silicides at the contact. In the present work, a physical model of tungsten silicide-silicon contacts is proposed, and the electronic properties of the interface and the charge-transfer mechanisms leading to change in electrophysical properties of the contact are analyzed. (6 refs.)

102509 The properties of laser-alloyed zinc layers on GaAs. B.Heulin, B.J.Sealy (Dept. of Electrical & Engng., Univ. of Surrey, Guildford, England).
Thin Solid Films (Switzerland), vol.105, no.3, p.227-35 (22 July 1983).
Optical microscopy, Rutherford backscattering and electrical measurements were performed on laser-irradiated zinc layers on GaAs. Hole concentrations of about 2×10^{21} cm^{-3} were recorded corresponding to a sheet carrier concentration of (1-2)$\times 10^{16}$ cm^{-2}. The p^+-n junctions formed are non-ideal and have high leakage currents which are associated with decomposition and surface roughness caused by the laser anneal. (11 refs.)

73.40Q Metal-insulator-semiconductor structures

(inc. semiconductor-to-insulator)

102510 Long-term effects of injected electrons in tunnel oxide on the electrical characteristics of Al gate/thin oxide/Si structures—relatively low oxide field case. K.Nagai, Y.Hayashi (Electrotech. Lab., Ibaraki, Japan).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.6, p.715-17 (June 1983).
Long-term effects of injected electrons in the tunnel oxide of a MOS structure is investigted. Forward tunneling current characteristics of the structure are not much affected and rather stable. The increase or decrease of reverse current due to long-term injected electrons in the tunnel oxide is found to be caused by the generation or annihilation of interface states by injected electrons. (11 refs.)

102511 Influence of a resistive sublayer at the polysilicon/silicon dioxide interface on MOS properties. N.Lifshitz, S.Luryi (Bell Labs., Murray Hill, NJ, USA).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.833-6 (July 1983).
The authors suggest that a thin ($\lesssim$100 Å) resistive sublayer of polysilicon near the oxide interface can have a pronounced effect on the MOS capacitance-voltage characteristics. On the depletion side of the *C-V* curve, the lower effective work-function difference leads to a higher threshold for strong inversion. On the accumulation side, the MOS capacitance is lowered due to the added thickness of the depletion sublayer. With the help of the sublayer model, the authors attempt to explain the anomalous behavior often observed in MOS capacitors with silicide/polysilicon gates. The sublayer depletion activates traps due to the heavy impurities (Cu, Fe, and Ta) at the interface, a considerable amount of which were observed in these samples by Auger spectroscopy. (4 refs.)

102512 Deep traps in metal-insulator-chemically vapor-deposited amorphous SiN_x diodes. G.Sasaki, S.Fujita, A.Sasaki (Dept. of Electrical Engng., Kyoto Univ., Kyoto, Japan).
J. Appl. Phys. (USA), vol.54, no.7, p.4008-13 (July 1983).
The dependence of capacitance of chemically vapor-deposited (CVD) amorphous $SiN_{0.2}$ metal-insulator-semiconductor (MIS) diodes on frequency and temperature is measured and discussed. The results show that the MIS diode includes slow states and fast states. The response time of slow states is 2.4×10^{-9} $\exp(-0.6\ eV/k_BT)$s above 130°C. The fast states fully respond to 95 Hz at 130°C. It cannot be distinguished whether these states originate from the interface states or the a-$SiN_{0.2}$ gap states. The densities are evaluated to be 6×10^{17} cm^{-3} eV^{-1} (fast states) and 6×10^{18} to 2×10^{19} cm^{-3} eV^{-1} (slow states) as the CVD a-$SiN_{0.2}$ gap states, or 6.9×10^{11} cm^{-2} eV^{-1} (fast states) and 6.2×10^{12} to 1.2×10^{13} cm^{-3} eV^{-1} (slow states) as the interface states. (13 refs.)

102513 Time-dependent response of interface states in indium phosphide metal-insulator-semiconductor capacitors investigated with constant-capacitance deep-level transient spectroscopy. P.van Staa, H.Rombach, R.Kassing (Inst. fur Angewandte Phys., Univ. Munster, Munster, Germany).
J. Appl. Phys. (USA), vol.54, no.7, p.4014-21 (July 1983).
Constant-capacitance deep-level transient spectroscopy measurements performed on InP-SiO_2 metal-insulator-semiconductor capacitors are reported for the first time. Two types of samples have been used, one of epitaxial InP with a free-electron concentration $n=1.4\times10^{15}$ cm^{-3} and covered with an 'undoped' SiO_2 insulating layer, the other of bulk material with $n=10^{16}$ cm^{-3} and covered with an HCl-'doped' SiO_2 dielectric. Extensive experiments have been performed and a model has been proposed which successfully explains the corresponding results. This model is based on the assumption of a spatial and energetical distribution of interface states within the dielectric. The interaction of these traps with the conduction band takes place via a tunneling process during the capture of electrons and by a tunneling followed by a thermally activated transition during the emission process. The interface state density has been found to be about 10^{12} cm^{-2} eV^{-1} in the energy range between about 0.2 and 0.5 eV below the conduction band and to decrease considerably to the conduction band about 0.2 eV. Thus accumulation can be reached. The interface state density strongly increases below about 0.6 eV for the undoped sample and about 0.7 eV for the HCl doped one. Thus strong inversion has not been observed. It is shown that the models presented previously are inconsistent with the experimental results while the model proposed in the present paper explains the authors' and most of the experimental results given in the literature. (20 refs.)

102514 Conductivity of inversion layers in InSb MIS structure below the 'mobility threshold'. S.V.Belotelov, V.A.Gergel', A.N.Solyakov, R.A.Suris.
JETP Lett. (USA), vol.37, no.2, p.1198-23 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.97-100 (20 Jan. 1983).
The temperature and field dependences of the conductivity of inversion layers in InSb MIS structures are studied. The experimental results are interpreted using the fluctuation theory of surface states and the conductivity of MIS structures [Zh. Eksp. Teor. Fiz. 84, 719 (1983)]. (3 refs.)

102515 Nonstoichiometric germanium nitride. A new insulating material for MIS microelectronics. I. The choice of the insulator and deposition. G.D.Bagratishvili, R.B.Dzhanelidze, D.A.Jishiashvili (Inst. of Cybernetics, Acad. of Sci., Tbilissi, Georgian SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.115-23 (16 July 1983).
A qualitative model of the electronic interaction at the insulator-semiconductor interface is proposed. On the basis of this model a sequence of electron-donor ability of the oxygen and nitrogen atoms in oxides and nitrides of the silicon subgroup is established which makes it possible to choose an insulator for a high-quality IS interface. A low-temperature method of obtaining thin films of nonstoichiometric germanium oxynitrides is described based on reactive sputtering of germanium in hydrazine plasma preceded by a low-temperature in situ etching of a semiconductor surface. (27 refs.)

102516 Subband energies in accumulation layers on InP. G.Abstreiter, R.Huber, G.Trankle, B.Vinter (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany).
Solid State Commun. (USA), vol.47, no.8, p.651-4 (Aug. 1983).
Resonant inelastic light scattering with incident photon energies close to the $E_0+\Delta_0$ optical gap in InP is used to study spin-flip single-particle and collective intersubband excitations in surface accumulation layers. The determined subband splittings and the depolarization shifts are compared with self-consistent calculations. From the obtained results it is concluded that the non-parabolicity of the conduction band cannot be neglected in the evaluation of the subband energies especially at high carrier concentrations. (16 refs.)

102517 Contact resistivity of TiN on p^+-Si and n^+-Si. M.Finetti, I.Suni, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA).
Sol. Cells (Switzerland), vol.9, no.3, p.179-83 (Aug. 1983).
The contact resistivity ρ_c of reactively sputtered TiN films deposited on silicon was measured with patterns conforming to the transmission line model. Values of $\rho_c=(2.8\pm0.5)\times10^{-4}$ Ω cm^2 and $\rho_c=(1.5\pm0.8)\times10^{-5}$ Ω cm^2 were determined on solar-cell-type p^+-Si (about 10^{20} B atoms cm^{-3}) and n^+-Si (about 2×10^{20} P atoms cm^{-3}) respectively. 102518 Experiment and theory for switching in $Al/V_2O_5/Al$ devices. G.S.Nadkarni, V.S.Shirodkar (Dept. of Phys., Inst. of Sci., Bombay, India).
Thin Solid Films (Switzerland), vol.105, no.2, p.115-29 (15 July 1983).
The experimentally observed DC and AC electrical properties of $Al/V_2O_5/Al$ devices and a model to interpret these results are presented. It was observed that these devices switch from a high impedance (OFF) state to a low impedance (ON) state (memory switching) when the voltage across them is increased to a critical value V_t. Further, V_t was found to be a function to the oxide thickness as well as of the ambient device temperature, and the extrapolation of the V_t-T characteristics gives the insulator-to-metal transition temperature T_c of V_2O_5. If the current through the device is controlled with an external resistor, it is possible to switch the device to a partially OFF state (i.e. the device resistance is lower than that of the original). The current-voltage characteristics were observed to be described by a relation of the type $I=A\exp(BV)$, irrespective of whether the device was in its completely OFF state or partially OFF state, in a limited voltage range. A device in the ON state can be switched back to its original OFF state by applying a voltage pulse of short duration. (14 refs.)

102519 Electroformed states in an Au-NaF-Au thin film structure. S.M.Babulanam, M.Ibrahim (Dept. of Phys., Dacca Univ., Dacca, Bangladesh).
Vacuum (GB), vol.33, no.5, p.307-9 (May 1983).
An Au-NaF-Au thin film structure exhibited electroformed states at the application of a step voltage $V_F=3\pm1$ V and then the structure showed a current maxima at a voltage $V_P=3\pm0.5$ V. The device became low conducting at an unforming voltage $V_U\geq4.5$ V. The voltage controlled negative resistance region occurred for $V_P<V_{VCNR}<V_U$. An Au-NaF-Au thin film structure generally showed a few tens of ohms resistance just after its preparation. The samples could be preformed through the application of a step voltage. Typical DC IU-V characteristics of a preformed sample (V42, NaF530 nm thick) at room temperature (302K) and under a voltage ramp of about 1 V min^{-1} are shown. The I-V characteristic was non-ohmic and a plot of I-V^2 showed a straight relation for $V<2$ V. (6 refs.)

73.60 ELECTRONIC PROPERTIES OF THIN FILMS

102520 Electrical conductivity and film morphology of TCNQ salt dispersion in polymer matrix. O.K.Kim (Naval Res. Lab., Washington, DC, USA).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.7, p.575-81 (July 1983).
A study of electrical conductivity and stability of N-methylphenazinium TCNQ (NMP^+TCNQ^-)*/polymer composite is reported with an emphasis on film morphology. Since this system can eliminate the influence of the CT interaction due to TCNQ°, the effect of the particular cation of this simple salt on the film morphology can be better evaluated. However, the role of TCNQ° doping was important for the composite stability and the conductive film morphology. Conductivity and stability of the films are discussed, with the morphological change which was studied spectroscopically in various matrices such as poly(vinyl acetal)s, polycarbonate, and poly(methyl methacrylate). (4 refs.)

102521 Electrical conduction in sputtered Si:Al films. A.D.Inglis, J.R.Dutcher, N.Savvides, S.P.McAlister, C.M.Hurd (Solid State Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Solid State Commun. (USA), vol.47, no.7, p.555-8 (Aug. 1983).
The d.c. electrical resistivity $\rho(x, T)$ has been measured for a series of granular Si_xAl_{1-x} sputtered films for $0.25<x<0.62$ and $4K<T<300K$. Three separate behaviours are identified in $\rho(x, T)$ corresponding to extrinsic activated semiconduction, metallic conduction and electron localisation. (13 refs.)

73.60D Metallic thin films

102522 Thermoelectric power of aluminum films. D.De, S.K.Bandyopadhyay, S.Chaudhuri, A.K.Pal (Dept. of General Phys. & X-rays, Indian Assoc. for the Cultivation of Sci., Calcutta, India).
J. Appl. Phys. (USA), vol.54, no.7, p.4022-7 (July 1983).
The thermoelectric power (TEP) of aluminum film was measured in the thickness range of 300-1600 Å. From the size effect of electron diffusion term, the energy dependence of the mean free path of conduction electrons (U) and the Fermi surface area (V) were calculated to be $U=0.957$ and $V=1.322$. The phonon-drag part of TEP also exhibited a size effect from which the mean free path of the dominant phonon mode was estimated to be 400 Å. The effect of grain boundary scattering on thermoelectric power was also studied. (29 refs.)

102523 Conduction parameters in chemically deposited thin silver films. C.R.Pichard, J.-P.Drexler, A.J.Tosser, J.Flechon (Lab. d'Electronique, Univ. de Nancy 1, Vandoeuvre-les-Nancy, France).
J. Mater. Sci. (GB), vol.18, no.8, p.2414-18 (Aug. 1983).
Experimental data related to the resistivity of chemically deposited silver films, and the TCR are interpreted from linearized equations in the framework of the three-dimensional conduction model. The electronic transmission coefficient at the grain boundary, t, and the electronic specular reflection coefficient at the film surface, p, are calculated from both resistivity and TCR measurements; no marked departure is observed. The high value of t agrees with crystallographic data. (37 refs.)

102524 Electron localization and interaction in bismuth thin films. Yu.F.Komnik, E.I.Bukhshtab, V.V.Andrievskii, A.V.Butenko (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.315-33 (Aug. 1983).
The authors have studied the conductivity of thin bismuth films (thickness $L\approx100$-200 Å) for temperatures from 1.4 to 4.2K and magnetic fields up to ~50 kOe. The low-temperature behaviour includes an increase in electrical resistance as temperature is lowered and an anomalous positive magnetoresistance. These features can be quantitatively described in terms of a theory accounting for electron localization and interaction in two-dimensional systems. The experimental data for conductivity in a perpendicular magnetic field are analyzed as suggested by the theory of Altshuler, Aronov, Larkin, and Khmel'nitskii (1981) and those for a parallel field by the theory of

Altshuler and Araonov (1978). The inelastic electron relaxation time at 1.4-4.2K was found to vary as T^{-p}, where $p=1.3\text{-}1.5$. (22 refs.)

102525 Studies on Co-Sn-Te thin films. J.G.Bamane, H.V.Keer (Industrial Hygiene Div., Central Labour Inst., Government of India, Bombay, India).
Pramana (India), vol.20, no.4, p.305-12 (April 1983).
Electrical and galvanomagnetic properties of $Co_xSn_{1-x}Te$ thin films have been studied. On the basis of small positive temperature coefficient of resistance, small and constant resistivity, low Hall coefficient and negligible magnetoresistance, it was concluded that CoTe-SnTe system is metallic. Discussion employing the Sondheimer's (1952) model further corroborated the metallic nature of the thin films. (13 refs.)

102526 Electrical resistivity and reduced temperature coefficient of polycrystalline metallic thin films. C.R.Pichard (Lab. d'Electronique, Univ. de Nancy, Vandoeuvre-les-Nancy, France), C.R.Tellier, A.J.Tosser.
Vide les Couches Minces (France), vol.38, no.215, p.3-11 (Jan.-Feb. 1983). In French. [received: July 1983]
Extended tabulated values of the resistivity of thin polycrystalline metal films and of the temperature coefficient are given. A linearized equation for the resistivity and its temperature coefficient is then proposed. Equations are proposed for calculating the Hall coefficient, the thermopower, the thermal conductivity and the strain coefficients in terms of film resistivity and its temperature coefficient. 102527 Hall mobility in undoped microcrystalline Si:H,Cl films. V.Augelli, R.Murri, T.Ligonzo (Dipartimento di Fisica, Univ. di Bari, Bari, Italy).
Appl. Phys. Lett. (USA), vol.43, no.3, p.266-7 (1 Aug. 1983).
The Hall mobility in undoped microcrystalline Si:H,Cl films has been measured in the temperature range $130<T<300$K. The dependence of μ_H on the temperature clearly evidences two different transport mechanisms. Above $T_0 \simeq 200$K, the Hall mobility has an activation energy of about 0.3 eV, while below T_0 it is practically temperature independent. (12 refs.)

102528 Electrical and structural properties of pulse laser-annealed polycrystalline silicon films. T.I.Cox, V.G.I.Deshmukh, J.R.Hill, H.C.Webber, N.G.Chew, A.G.Cullis (Royal Signals & Radar Establ., Great Malvern, England).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.737-44 (July 1983).
Doped epitaxial films of Si on single-crystal high-resistivity Si substrates have been prepared using ion implantation and Q-switched ruby laser annealing of LPCVD polycrystalline Si layers. Films doped with B or As in the range 10^{17} to 5×10^{20} cm^{-3} were studied by the measurement of their resistivities, Hall mobilities, and doping density profiles. The good film quality achieved permitted the fabrication of p-channel MOS transistors which, through measurements of threshold voltage and transconductance, yielded additional data on the surface mobility and the integrity of the Si-SiO_2 interface. The electrical properties of the films compared favorably with those of similarly doped single-crystal material, and transmission electron microscopy was used to confirm the good structural quality of the epitaxial growth. (15 refs.)

102529 Electrical characteristics of contact of polycrystalline and monocrystalline silicon films with the same type of conductance. F.D.Kasimov, Z.A.Iskender-Zade, A.G.Abdulla, V.M.Mamikonova.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.76-9 (1982). In Russian.
V-A characteristics of contacts of polycrystalline and monocrystalline Si films with the same type of conductance were investigated. It was shown that under the certain conditions of growth and thermal treatment leakage currents of interfaces of poly- and monocrystalline films were small. At the voltage above 120 V the effect of S-type switching was observed. The cutoff voltage depended on the length of the films. (8 refs.)

102530 Effects of controlled hydrogenation by ion implantation on the localized states in vacuum evaporated amorphous silicon. T.C.Lee, G.W.Neudeck (School of Electrical Engng., Purdue Univ., West Lafayette, IN, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.3977-82 (July 1983).
Hydrogen incorporation into electron beam vacuum-evaporated amorphous silicon films has been performed by ion implantation followed by a low temperature thermal activation at 230°C. After hydrogenation, a field effect conductance change of 4 orders of magnitude was observed. A comparison of the samples before hydrogenation and after hydrogenation demonstrates that almost 3 orders of magnitude reduction (from about 10^{22} /cm^3 eV to about 10^{19} /cm^3 eV) in the density of localized states near the Fermi level in the energy gap has been achieved. Varying the hydrogen implantation dosage between samples from 1×10^{16} to 1.5×10^{17} /cm^2, with all other sample preparation procedures fixed, causes a decrease in the density of localized states near the Fermi level of the amorphous silicon from 8.6×10^{20} to 1×10^{19} /cm^3 eV. (41 refs.)

102531 Mechanism of dispersive transport in hydrogenated amorphous silicon. J.Shirafuji, H.Matsui, Y.Inuishi (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
J. Appl. Phys. (USA), vol.54, no.7, p.3983-6 (July 1983).
Temperature dependence of the electron mobility and the dispersion parameter in hydrogenated amorphous silicon films, deposited by glow-discharge decomposition and RF reactive sputtering methods, has been measured by means of time-of-flight technique. The results of the dispersion parameter are not consistent with the theoretical prediction which has been derived on the assumption of an exponential band tail. The temperature dependence of the electron mobility seems to be more likely to invoke the presence of traps located predominantly at about 0.2 eV below the conduction band. Several possibilities suitable to this situation are discussed. (21 refs.)

102532 Impedance of thin semiconductor films in low electric field. Kwyro Lee, M.S.Shur (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4028-34 (July 1983).
Impedance and admittance of a thin semiconductor film in the direction perpendicular to the film is calculated as a function of the sample length, doping, and temperature for voltages smaller than the thermal voltage. The calculation is based on the approximate solution of the Boltzmann equation in the relaxation time approximation. When the sample length is smaller than the mean free path, the conductance becomes independent of the sample length. In this limit the inductive susceptance is proportional to the sample length. When the sample length becomes comparable to the mean free path, the inductive susceptance reaches the maximum value, and then decreases. The calculation shows that for high mobility GaAs samples at 77K, the size effect may be important for films thinner than 5 μm. The results of the calculation are interpreted in the frame of a simple equivalent circuit which includes the bulk resistance, in series with the resistance due to the finiteness of the sample length, in series with the inductance L due to the inertia effect of the carrier transport, and all in parallel with the geometric capacitance C. The sample inductance L is approximately equal to $(\omega_p{}^2C)^{-1}$ where ω_p is the plasma frequency. This simple model agrees fairly well with the results of the numerical calculation. The calculation, based on the model demonstrates that the predicted effects can be observed for realistic values of the contact resistance. (14 refs.)

102533 Grain boundary phenomena in n-type CdTe films grown by hot wall vacuum evaporation. W.Huber, A.L.Fahrenbruch, C.Fortmann, R.H.Bube (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4038-43 (July 1983).
Films of *n*-type CdTe doped by coevaporation of indium have been deposited by hot wall vacuum evaporation on 7059 Corning glass and BaF_2 single crystal substrates. Layers deposited on glass show a dark resistivity of the order of 10^5 Ω cm and a light resistivity of 500 Ω cm under AM1.5; photoexcitation increases the electron density but does not affect the electron mobility. Layers deposited on BaF_2 show a dark resistivity of about 3 Ω cm and a light resistivity of about 2 Ω cm, corresponding to an electron density of 3.9×10^{16} cm^{-3} and an electron mobility of 48 cm^2/V s; illumination of these layers on BaF_2 increases the electron mobility but not the electron density. A quantitative model for grain boundary transport in polycrystalline materials is shown to give good agreement with the experimental data. (10 refs.)

102534 Interpretation of DC characteristics of phosphorus-doped polycrystalline silicon films: conduction across low-barrier grain boundaries. E.Loh (Electro-Optical & Data Systems Group, Hughes Aircraft Co., El Segundo, CA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4463-6 (Aug. 1983).
Current-voltage curves of phosphorus-doped polycrystalline silicon films of Lee and Cheng (1982) are reanalyzed with the same trapping model of thermionic and thermionic-field emission across symmetrical Schottky barriers between grains. The analysis yields unexpectedly low values of the effective number of grains N_{eff} in the conducting path. Values of N_{eff}/N_{geo} decreases from 0.5 at 20K to 0.1 at 300K, where N_{geo}=(film length)/(typical grain size). A DC conduction model is proposed. Carriers in phosphorus-doped polysilicon films travel extensively across low-barrier grain boundaries, where electrons from segregated phosphorus are abundant enough to fill most of the electron traps. The model can also explain an observed current-temperature relation $i \propto T^3$ at low bias voltages and yield values of barrier resistance comparable to reported data on polycrystalline silicon neutron-transmutation doped with phosphorus measured by a small-area traveling potential probe. (16 refs.)

102535 Laser-recrystallized polycrystalline silicon resistors for integrated circuit applications. H.Schaber, D.Cutter (Zentralbereich Tech., Siemens AG, Munchen, Germany), J.Binder, E.Obermeier.
J. Appl. Phys. (USA), vol.54, no.8, p.4633-40 (Aug. 1983).
The influence of grain boundaries on the electrical properties of laser-recrystallized polycrystalline silicon films, which a typical grain size 1×20 μm^2 and doping concentration between 10^{16} and 10^{20} cm^{-3}, has been investigated. Over a wide range of doping concentration, sheet resistance and its temperature dependence are found to be very close to the values expected for single crystal material. Deviations occur at low doping levels and are related to the average grain size perpendicular to the current flow. The standard deviation and laser power dependence of sheet resistance $R_\square$ are strongly correlated to the influence of grain boundaries, as measured by the deviation of $R_\square$ from the single crystal value. The main sources of resistor nonlinearity are substrate field effects and the dependence of grain boundary potential barriers on applied bias. At doping concentrations $\gtrsim 10^{18}$ cm^{-3} very linear resistors are obtained reproducibly. Resistance ratios can be controlled to better than 1% and temperature coefficients $\lesssim 10^{-4}$/K can be achieved by proper choice of doping concentration. (18 refs.)

102536 Influence of carbon addition on the electrical and structural properties of phosphorus and boron doped silicon layers. W.A.P.Claassen, J.Bloem, F.H.P.M.Habraken (Philips Res. Labs., Eindhoven, Netherlands).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1586-92 (July 1983).
Phosphorus and boron polycrystalline silicon layers grown by chemical vapor deposition were additionally doped with carbon via the introduction of C_2H_2 in the gas phase. Addition of carbon to n-type and p-type polycrystalline silicon gives rise to characteristic differences in resistivity *vs.* $P(C_2H_2)$ input pressures, at least at small input pressures of C_2H_2. The difference in resistivity can be explained by a donor activity of carbon or silicon-carbon complexes or by an asymmetrical energy distribution of grain boundary traps, both at the grain boundaries. It is also shown that the addition of carbon has a strong influence on the morphology of the growing silicon layer. With increasing values of $P(C_2H_2)$, the size of the grains in the layer decreases, under certain circumstances even amoprhous silicon is formed, and this effect is stronger at the lowest temperatures. The decomposition kinetics of C_2H_2 has also been discussed. It is concluded that at high input pressures of C_2H_2 the deposition rate of carbon is gas phase diffusion controlled. At lower $P(C_2H_2)$ values and temperatures above 850°C, the formation of Si-C nuclei is rate-limiting as far as the introduction of carbon is concerned. (19 refs.)

102537 Peculiarities of induced potential in silicon layers. E.E.Aboltin'sh, Kh.I.Kugel'.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.21-3 (1983). In Russian.
The induced potential dependence on the conductivity in silicon layers has been investigated. (4 refs.)

102538 Thermoelectric power in InAs films obtained by flash evaporation. A.K.Sharma, P.Jayarama Reddy (Dept. of Phys., S.V. Univ. Coll., Tirupati, India).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K27-9 (16 July 1983).
Presents results on the thermoelectric power behaviour as a function of different deposition parameters viz., temperature of the film and substrate, film thickness, post deposition heat treatment, etc. (4 refs.)

102539 The influence of heating on the characteristics of the electron-excited conduction in gallium phosphide films. S.A.Azimov, D.A.Aronov, V.M.Rubinov, M.Tuichiev (S.V. Starodubtsev Physico-Tech. Inst., Acad. of Sci., Tashkent, Uzbek SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K53-8 (16 July 1983).
The authors present some experimental results and an analysis of the temperature dependence of current in sandwich structures based on GaP films of thickness d=0.1 to 0.5 μm and excited by an electron beam. They have studied the current-voltage characteristics (CVC) plotted at beam currents varying within $I_b=2\times10^{-9}$ to 6×10^{-8} A and T=295 to 385K, the dependence of current J in the sample on the beam current at a given voltage U and various temperatures T, as well as its dependence on 1/T at various values of I_b and voltages corresponding to the ohmic and superlinear regions of CVC and to that of almost vertical current rise. (5 refs.)

102540 Magnetoresistance thickness dependence of n-InSb. E.W.Kreutz (Inst. fur Angwandte Phys., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K71-5 (16 July 1983).
Geometry effects via specimen thickness and inhomogeneities via internal barriers have been discriminated by investigation of the thickness, field, and temperature dependence of the magnetoresistance. The author presents new data on n-type InSb with real surfaces, which give greater insight into the contributing effects. (13 refs.)

102541 Electrical conductivity of β-$Na_{0.33}V_2O_5$ thin films. O.B.Ajayi, O.F.Taiwo, E.J.Ibanga (Dept. of Phys., Univ. of Ife, Ile-Ife, Nigeria).
Thin Solid Films (Switzerland), vol.105, no.2, p.97-101 (15 July 1983).
β-$Na_{0.33}V_2O_5$ was deposited by the pyrolysis of a mixture of V^{III}-acetylacetonate and sodium carbonate. The composition was determined using a combination of X-ray diffraction, Rutherford backscattering and Auger electron spectroscopy. The electrical conductivity of the deposited films as a function of temperature is of the form $\sigma=(\sigma_0/T)\exp(-E_A/kT)$ with $E_A=0.21\pm0.013$ eV. The electrical conductivity is in agreement with the predictions of the small polaron model. (19 refs.)

102542 Characterization of fluorine-doped In_2O_3 films synthesized by spray pyrolysis. S.P.Singh, A.Raza, A.K.Sharma, O.P.Agnihotri, L.M.Tewari (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Thin Solid Films (Switzerland), vol.105, no.2, p.131-8 (15 July 1983).
Thin films of fluorine-doped In_2O_3 were prepared by spray pyrolysis. For a doping concentration of 2.4 wt.% NH_4F and a substrate temperature of 310°C, the films had a maximum figure of merit, i.e. a high transmission of about 90% and a low sheet resistance of about 10 Ω/□. The effects of the doping concentration and substrate temperature were exploited in order to obtain low sheet resistances and high transmissions in the visible range of the solar spectrum. Mobilities as high as 48 $cm^2\ V^{-1}\ s^{-1}$ and carrier concentrations of about $3.6\times10^{20}\ cm^{-3}$ were achieved in as-deposited films. X-ray diffraction and transmission electron diffraction patterns and micrographs indicated good crystallinity. The (400) reflection was of maximum intensity in all cases. These films have potential for application as a top conducting layer in solar cells because of their high transmissions in the visible range of electromagnetic radiation and their low sheet resistances. (13 refs.)

102543 Electrical conductivity, structure and Hall effect measurements of InSe films. D.V.Krishna Sastry, P.Jayarama Reddy (Dept. of Phys., Sri Venkateswara Univ., Tirupati, India).
Thin Solid Films (Switzerland), vol.105, no.2, p.139-47 (15 July 1983).
Stoichiometric InSe films were prepared by discrete evaporation using spectrally pure (99.999%) InSe powder in a residual pressure of about 4×10^{-6} Torr. The thickness of the films was varied from 500 to 3000 Å. The electrical conductivity, of the films was measured by Van der Pauw's method. The as-deposited films had an amorphous structure as observed with an electron microscope. Thermal annealing was carried out through a number of annealing cycles and a transformation to a crystalline state during the process was evidenced by the electron micrographs. Conductivity measurements were made on the amorphous films from the transition temperature to liquid air temperature and the activation energies were calculated from the variation in conductivity with temperature. The density of states at the Fermi level was also calculated at low temperatures. Hall effect measurements were made on the annealed films and the Hall mobility μ_H, the Hall coefficient R_H and the carrier concentration n were evaluated. (30 refs.)

74.10 OCCURRENCE, CRITICAL TEMPERATURE

102545 On the relation between T_c measurements and structure inhomogeneity of Nb_3Ge superconductor. K.Frohlich, D.Machajdik, S.Benacja, V.Cernusko (Electrotech. Inst. Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.419-23 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Transition curves of Nb_3Ge samples prepared by chemical vapour deposition were obtained by resistive and inductive methods. The differences between the values of T_c midpoints of both methods as well as the width of superconducting transition measured inductively are found to be dependent on the degree of inhomogeneity. As a measure of inhomogeneity the half-width of diffraction peak was chosen. Using the resistive method T_c onset of 23.2K was obtained for one of the samples. (6 refs.)

102546 Some physical properties of multifilamentary Nb_3Sn superconductors prepared by bronze technology. J.Kruzliak, P.Hutka, P.Kovac, P.Setina (Inst. of Electrical Engng., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.425-31 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The critical current densities and critical temperatures of multifilamentary Nb_3Sn superconductors prepared by the bronze technology were studied. It is shown that the growth rate of Nb_3Sn layer under given conditions of heat treatment depends also on the number of filaments in the wire. The critical current densities obeying $10^9\ A/m^2$ at 5T were obtained. The J_c values in the cross section of the Nb_3Sn layer are not constant, because the grain diameter of Nb_3Sn is not homogeneous. The influence of growth rate on T_c was also observed. The lower T_c values are obtained for higher growth rates of the Nb_3Sn layer. (11 refs.)

102547 The effect of precipitation heat treatments on the critical temperature in Ti-rich Nb-Ti alloys. L.Miu, D.Niculescu, E.Cruceanu (Inst. of Phys. & Technol. of Materials, Bucharest-Magurele, Rumania).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.425-7 (Aug. 1983).
Precipitation heat treatments are found to produce an increase in critical temperature (T_c). Explanations of this effect are discussed. One is based on the Nb enrichment of the superconducting Nb-Ti (β) matrix during Ti-rich secondary phase precipitation (α-ti, thermal ω). The other is based on the varying extent of the superconducting proximity effect. (4 refs.)

102548 Microstructure and superconducting properties of helium-saturated niobium-titanium alloy. P.G.Vasilev, I.N.Goncharov, G.T.Zhdan, Sh.Sh.Ibragimov, L.V.Petrova, V.F.Reutov, E.P.Romanov (Joint Inst. for Nuclear Res., Dubna, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1092-100 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Foils 58-μm thick were made from $Nb_{0.8}Ti_{0.2}$ after recrystallization and saturation with helium (by irradiation with α-particles of 29 MeV energy in air). These foils were subjected to annealing at various temperatures. At each stage the microstructure was determined under an electron microscope and measurements were made of the superconducting transition temperature T_c, resistivity in the normal state ρ_n, the second critical field H_{c2}, and the pinning force F_p. The results were compared with the data obtained for helium-saturated samples of both pure niobium and of $Nb_{0.97}Ti_{0.03}$. (6 refs.) *A.T*

102549 Superconductivity of FCC tantalum nitride at high pressures up to 12 GP*a*. M.A.Il'yina, W.S.Maynashev, T.A.Pashkina.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.757-9 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The T_c (P) dependences of nonstoichiometric f.c.c. TaN of different composition has been studied. The said dependences are found to suffer disontinuities at different pressures P depending on the initial values of T_c. X-ray analysis of the samples under pressures up to 12 GP*a* did not reveal the appearance of any new crystal modification of TaN. Such a kind of T_c (P) dependence in TaN is supposed to be connected with the changes in the energy spectrum of carriers due to the pressure. (10 refs.)

102550 Superconductivity in $CeCu_2Si_2$: dependence of T_c on alloying and stoichiometry. H.Spille, U.Rauchschwalbe, F.Steglich (Inst. fur Festkorperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.165-77 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors have determined the transition temperatures of the alloy systems $(Ce,M)Cu_2Si_2$ with $M=La,Y,Sc$, $Ce(Cu,T)_2Si_2$ with $T=AG,Au,Mn,Ru,Rh,Pd$ and $CeCu_2(Si,Ge)_2$ as well as of $CeCu_2Si_2$ samples with varying stoichiometry. In each case, alloying is found to depress T_c, the critical concentrations necessary to destroy superconductivity ranging between <1 at.% and 10 at.%. Off-stoichiometry samples with a Cu- or Ce-deficiency of a few at.% are not superconducting, while samples prepared with a comparable excess of Cu or Ce show sharp transitions at $T_c \gtrsim 600$ mK. The authors infer that stoichiometric $CeCu_2Si_2$ contains substantial concentrations of Cu- and Ce-vacancies, which hinder superconductivity. First results on $CeCu_2Si_2$ single crystals, which exhibit bulk superconductivity, are also reported. (21 refs.)

102551 Superconducting transition temperature versus thickness of Nb film on various substrates. J.Kodama, M.Itoh, H.Hirai (Dept. of Electronic Engng., Kinki Univ., Osaka, Japan).
J. Appl. Phys. (USA), vol.54, no.7, p.4050-3 (July 1983).
Dependence of superconducting transition temperature on the thickness of Nb films deposited upon several kinds of substrates by means of RF sputtering was studied in search of rudimental data necessary in fabricating variable thickness microbridge type Josephson junctions. The transition temperature was found to lower with the decrease of Nb film thickness. The lowering characteristics of the transition temperature were found to vary in accordance with whether the substrate surface was amorphous or crystalline. The cause of the variance was studied on thin films with the aid of X-ray diffraction pattern analysis and measurement of film resistance. (2 refs.)

102552 On the relationship between the electronic density of states and the superconducting critical temperature of disordered V_3Si. D.O.Welch, C.S.Pande, R.Caton (Brookhaven Nat. Lab., Upton, NY, USA), R.Viswanathan.
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.289-300 (Aug. 1983).
The available data on the effect of neutron and α-particle irradiation on the superconducting properties and the low-temperature specific heat capacity of single- and polycrystalline V_3Si were analyzed in a unified manner. It was found that the electron-phonon renormalization parameter λ does not vary simply proportionally to the bare density of electron states at the Fermi level as had been earlier conjectured by Dynes and Varma (1976), nor does it vary in exactly the same manner as found by Fradin and Williamson (1974) to hold for a variety of vanadium-based A15 structure compounds and pseudobinary alloys. When the behaviour of V_3Si is compared with that of Nb_3Sn, Nb_3Al, and Nb_3Ge, it is seen that the response to disorder of parameters of importance in the superconductivity of these compounds does not follow any simple, universal behaviour. (28 refs.)

102553 Superconductivity and structural transformation in HfRuAs. G.P.Meisner (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, La Jolla, CA, USA).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.483-6 (1 Aug. 1983).
HfRuAs exists in two structural modifications. The high-temperature phase (ZrRuSi-type structure) exhibits superconductivity at 4.93-4.37K, whereas the low-temperature phase (TiFeSi-type superstructure) remains normal at 1K. The lattice distortion giving rise to the superstructure indicates zig-zag chains of metal atoms are crucial to superconductivity in this class of compounds. (23 refs.)

102554 Effects of oxygen content on pressure-induced superconductivity in $EuMo_6S_8$. D.W.Capone, R.P.Guertin (Tufts Univ., Medford, MA, USA), S.Foner, D.G.Hinks, Hung-Chen Li.
Phys. Rev. Lett. (USA), vol.51, no.7, p.601-4 (15 Aug. 1983).
Pressure-induced superconductivity in $EuMo_6S_8$ is sensitive to the systematic addition of oxygen. As oxygen content increases, the critical pressure above which the sample is superconducting ($P \simeq 11$ kbar) decreases, the onset is less abrupt, the maximum T_c (11.8K) decreases, and dT_c/dP at high pressures (−0.29 K/kbar) is less negative. The c/a ratio and the unit cell volume vary linearly with the extrapolated zero pressure T_c. The results are discussed in terms of an oxygen-induced defect at the Eu site. (21 refs.)

102555 The Pd-Pt-H system: phase transformations at high pressure and superconductivity. V.E.Antonov, T.E.Antonova, I.T.Belash, E.G.Ponyatovskii, V.I.Rashupkin (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.137-46 (16 July 1983).
Studies on crystal structure and superconducting properties of hydrogen solid solutions in the Pd-Pt alloys with 2.8, 10, 15, 25, 40, and 60 at% Pt are presented. Palladium alloying with platinum is shown to decrease the maximum values of superconducting transition temperature attainable at hydrogenation. The phenomenon of dissolution to phases rich and poor in platinum is revealed for the solutions based on the alloys containing 15 to 60 at% Pt. Hydrogenation of the samples is performed at hydrogen pressures to 6.5 GLa and temperatures to 350°C. (14 refs.)

102556 Effect of thermal phonons on the superconducting transition temperature. C.R.Leavens (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), E.Talbot.
Phys. Rev. B (USA), vol.28, no.3, p.1304-13 (1 Aug. 1983).
There is no consensus in the literature on whether or not thermal phonons depress the superconducting transition temperature T_c. In this paper it is shown by accurate numerical solution of the real-frequency Eliashberg equations for the pairing self-energy ϕ and renormalization function Z that thermal phonons in the kernel for ϕ raise T_c but those in Z lower it by a larger amount so that the net effect is to depress T_c. (A previous calculation which ignored the effect of thermal phonons the ϕ overestimated the suppression of T_c by at least a factor of 3.) It is shown how to switch off the thermal phonons in the imaginary-frequency Eliashberg equations, exactly for Z and approximately for ϕ. The real-frequency and approximate imaginary-frequency results for the depression of T_c by thermal phonons are in very satisfactory agreement. Thermal phonons are found to depress the transition temperature of Nb_3Sn by only 2%. It is estimated that the suppression of T_c by thermal phonons saturates at about 50% in the limit of very strong electron-phonon coupling. (18 refs.)

102557 Upper critical fields and superconducting transition temperatures of some zirconium-base amorphous transition-metal alloys. M.G.Karkut, R.R.Hake (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1396-418 (1 Aug. 1983).
Superconducting upper critical fields $H_{c2}(T)$, transition temperatures T_c, and normal-state electrical resistivities ρ_n have been measured in the amorphous transition-metal alloy series $Zr_{1-x}Co_x$, $Zr_{1-x}Ni_x$, $(Zr_{1-x}Ti_x)_{0.78}Ni_{0.22}$, and $(Zr_{1-x}Nb_x)_{0.78}Ni_{0.22}$. Structural integrity of these melt-spun alloys is indicated by X-ray, density, bend-ductility, normal-state electrical resistivity, superconducting transition width, and mixed-state flux-pinning measurements. The specimens display $T_c=2.1\text{-}3.8$K, $\rho_n=159\text{-}190$ $\mu\Omega$cm, and $|(dH_{c2}/dT)_{Tc}|=28\text{-}36$ kG/K. These imply electron mean free paths $l \approx 2\text{-}6$ Å, zero-temperature Ginzburg-Landau coherence distances $\xi_{G0} \approx 50\text{-}70$ Å, penetration depths $\lambda_{G0} \approx (7\text{-}10) \times 10^3$ Å, and extremely high dirtiness parameters $\xi_0/l \approx 300\text{-}1300$. All alloys display $H_{c2}(T)$ curves with negative curvature and (with two exceptions) fair agreement with the standard dirty-limit theory of Werthamer, Helfand, Hohenberg, and Maki (WHHM) for physically reasonable values of spin-orbit-coupling induced, electron-spin-flip scattering time τ_{so}. (136 refs.)

102558 Superconductivity and magnetic order: low temperature phase diagrams. M.B.Maple (Dept. of Phys., Univ. of California, San Diego, La Jolla, CA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.337-52
Recent experiments on magnetically-ordered ternary and pseudoternary rare earth superconductors are briefly reviewed. Superconductivity has been found to coexist with antiferromagnetic order, but to be destroyed by the onset of ferromagnetic order at a second transition temperature $T_{c2} \sim T_M$, where T_M is the Curie temperature. In antiferromagnetic superconductors, the antiferromagnetic order modifies superconducting properties such as the curve of the upper critical magnetic field versus temperature. In ferromagnetic superconductors, a long wavelength ($\sim 10^2$ Å) sinusoidally modulated magnetic state develops in the superconducting state as a result of the superconducting-ferromagnetic interactions. The interplay of superconductivity and competing magnetic interactions in pseudoternary rare earth systems produces complex and interesting low temperature phase diagrams. (47 refs.)

74.20 THEORY

102559 Application of the 'boson method' to the study of superconducting order parameter. A.Pevala (Inst. of Electrical Engng., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.321-30 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
A brief outline of the so called 'boson method' in the theory of superconductivity is presented. The computation of the space dependence of the superconducting order parameter by means of this method has some advantages compared to standard techniques based on Gor'kov equations. The possibility of obtaining the space dependence of this quantity in the general form is shown. (15 refs.)

102560 Theory of magnetic superconductors. M.Tachiki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.189-206 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
An epoch-making discovery of new ternary compounds which are simultaneously superconductors and magnetic materials was made in 1977. Since then, many materials of this type have been found and are called 'magnetic superconductors'. These materials have unusual properties owing to the interplay between superconductivity and magnetism. The explanation of these properties and the predictions of new phenomena are presented. (59 refs.)

102561 Magnetic properties of superconducting or normal networks and random walks on percolating clusters. G.Toulouse, R.Rammal (Lab. de Phys., ENS, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.733-40 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A scaling theory for the diamagnetic susceptibility and the upper critical field of random mixtures of superconducting and insulating elements is presented. The resulting predictions for the critical field are compared with experiments on InGe films and numerical simulation data. One important critical exponent in the theory is related to the spectral dimensionality of a fractal structure, which also governs the diffusion properties. The authors suggest that the number S_N of distinct sites visited during an n-step random walk on an infinite cluster at percolation threshold varies asymptotically as: $S_N \sim N^{2/3}$, in any dimension $d \leq 6$. For more regular networks, such as periodic lattices (with a strip geometry) and fractal structures, the spectrum of Landau levels has been determined. The contribution of the edge states to the quantized Hall conductance is explained in a way which clarifies the role of the geometry in the derivations of this effect. (21 refs.)

102562 Coexistence of superconductivity and ferromagnetism in surface layers of rare-earth ternary compounds. U.Klein (Inst. fur Theoretische Phys., Univ. Linz, Linz, Austria).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.409-12 (25 July 1983).
The bulk and surface stability limits of the homogeneous superconducting and ferromagnetic phases of a ferromagnetic superconductor are investigated using a generalized Ginzburg-Landau functional. It is found that both on cooling and on warming the bulk phase transitions are preceded by transitions to coexistence phases localized at the surface. (11 refs.)

102563 Correlation of superconductivity with material properties. P.K.Lam, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.114-16 (15 Aug. 1983).
A simple model is used to study the trends of the electron-phonon interaction parameter λ. (8 refs.)

102564 Electrical conductivity of a quasi-one-dimensional superconductor. K.Okamoto (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1666-8 (May 1983).
Electrical conductivity of a quasi-one-dimensional superconductor is discussed by the use of the phase Hamiltonian with which the impurity scattering and the interchain interaction are taken into account. The behaviour of the calculated conductivity as a function of temperature is similar to that of the observed conductivity of TMTSF salts. (12 refs.)

102565 Role of potential scattering in the Shiba-Rusinov theory of the magnetic impurities in superconductors. Y.Okabe, A.D.S.Nagi (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.3, p.1320-2 (1 Aug. 1983).
The Shiba-Rusinov theory of magnetic impurities in a superconductor is investigated, with special attention paid to the role of the potential scattering term in the electron-impurity interaction. The meaning of Anderson's theorem in the Shiba-Rusinov theory is discussed. (10 refs.)

102566 Anisotropic superconductors containing paramagnetic impurities. Y.Okabe, A.D.S.Nagi (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.3, p.1323-8 (1 Aug. 1983).
The effect of paramagnetic impurities on superconductors with energy-gap anisotropy is studied using the Shiba-Rusinov theory and treating the ordinary and exchange interactions equally. The Abrikosov-Gor'kov-theory results are a special case of the calculations. The transition temperature T_c and the jump in specific heat at T_c are calculated. The emphasis is to clarify the roles of the ordinary and the exchange interactions in the electron-impurity scattering. The difference between the results of the Shiba-Rusinov and Abrikosov-Gor'kov theories is brought out. (14 refs.)

74.20F BCS theory and its applications

102567 Electron-phonon interaction and superconductivity of lanthanum. Zhang Li-yuan, Han Ru-san, Zhang Yu-lin (Dept. of Phys., Beijing Univ., Peking, China).
Chin. Phys. (USA), vol.3, no.2, p.484-8 (April-June 1983).
Based on a band theory analysis, the BCS mechanism of superconductivity is valid for lanthanum. The principal factor resulting in the comparatively high superconductive transition temperature in lanthanum is the large $\langle I^2 \rangle$ value, caused by *d-p* and *d-f* scattering. The abundance of an *f* partial-wave component in the band structure of lanthanum and the unfavourable factor of its large atomic volume should attract further attention in the preparation of superconductive materials containing lanthanum. It appears that lanthanum is one of the typical '*f* band' superconductors. (23 refs.)

102568 Dispersion of superconducting gap excitations in layered charge density wave systems. G.C.Mahanty, S.N.Behera (Inst. of Phys., Bhubaneswar, India).
Can. J. Phys. (Canada), vol.61, no.8, p.1160-8 (Aug. 1983).
The phonon spectral function for charge density wave (CDW) systems in the superconducting (SC) phase is calculated for finite wave vectors (q). An exact expression for the q dependent phonon self-energy is obtained. The analysis is carried out with a small q limit. The spectral function shows a two peak structure for frequencies ω less than the SC energy gap (2Δ) in contrast to the single peak obtained by Balseiro and Falicov (1980) for $q=0$. The peaks approach each other with increasing q and finally merge into one. Both modes have linear dispersions for small q and the frequency of the low-lying one goes to zero as $q \to 0$. For $\omega > 2\Delta$ the phonon spectrum does not change significantly. The results are discussed in context with the Raman scattering observation of SC gap excitations in $2H\text{-}NbSe_2$ (a layered compound exhibiting both CDW and SC transitions) by Sooryakumar and Klein (1981). The present calculation demands that the strength of coupling between the CDW phonon and SC electrons be an order of magnitude smaller than that used for $q=0$ in order to get an agreement with the experimental result. (15 refs.)

74.30 GENERAL PROPERTIES

102569 Spin susceptibility in superconductors. W.A.Roshen, J.Ruvalds (Phys. Dept., Univ. of Virginia, Charlottesville, VA, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1329-31 (1 Aug. 1983).
The wave-vector-dependent spin susceptibility $\chi(q)$ of a superconductor in one, two, and three dimensions is calculated numerically. These calculations show that for large $q \sim k_F$, where k_F is the Fermi momentum, $\chi(q)$ is essentially the same as that in the normal state, indicating that for distances $r \ll \xi_0$(ξ_0 the coherence length), Ruderman-Kittel-Kasuya-Yosida coupling between magnetic atoms is essentially unchanged by superconductivity of the system. In one and two dimensions the authors find a reduction in $\chi(q)$ at very small q, whose structure affects any possible cryptomagnetic order of the type suggested by Anderson and Suhl (1959) for the case of three dimensions. In three dimensions the calculation verifies the validity of the approximate $\chi(q)$ of Anderson and Suhl in the appropriate q region. For small q, $\chi(q)$ shows a much stronger dependence on q for lower dimensions than in the three-dimensional case, which has a bearing on the range of magnetic ordering, and may be relevant to rare-earth materials with Fermi-surface 'nesting'. 74.30E Thermodynamic properties; thermal conductivity

102570 Search for two-dimensional melting in a lattice of superconducting vortices. P.Martinoli, M.Nsabimana, G.A.Racine, H.Beck (Inst. de Phys., Univ. de Neuchatel, Neuchatel, Switzerland), J.R.Clem.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.765-85 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The dynamic shear response Z of the vortex lattice in superconducting granular Al films shows interesting features near T_M, the Kosterlitz-Thouless temperature for dislocation-mediated melting. The T-dependence of Z is interpreted in terms of the coupled motion of the displacement field and dislocations in an elastic continuum. Pinning of the vortices by inhomogeneities seems to play an important role. (18 refs.)

102571 Behavior of a hollow superconducting cylinder in a magnetic field. R.M.Arutunian, G.F.Zharkov (Lebedev Phys. Inst., Moscow, USSR).
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.409-31 (Sept. 1983).
The behavior of a hollow superconducting cylinder of arbitrary dimensions in an external magnetic field is investigated in detail within the Ginzburg-Landau macroscopic theory. The thermodynamic potential of the system is presented in a compact form, which enables the authors to give a simpler description of the transitions of the system between the quantized levels in a magnetic field than in previous work on this subject. The general theory is illustrated by a number of cases, which show the dependence of the order parameter, the total flux in a cavity, and the magnetic moment of the cylinder on the magnitude of the external field and on temperature. The phase transition curves and the hysteresis boundaries are found. The tricritical points, where the difference between first- and second-order phase transitions vanishes, are established. The oscillations in a magnetic field of the specific heat of the cylinder are investigated. The formulas are presented for the case of a thin-walled cylinder and are valid for arbitrary values of the order parameter ψ, inner and outer radii of the cylinder, external field, and temperature. The results are discussed in connection with experiment and other papers on this subject. (40 refs.)

102572 Size effect on the lattice thermal conductivity of lead single crystals. W.Odoni, P.Fuchs, H.R.Ott (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
Phys. Rev. B (USA), vol.28, no.3, p.1314-19 (1 Aug. 1983).
The authors have measured the temperature dependence of the thermal conductivity λ of lead single crystals with different sample dimensions in the superconducting state between 0.05 and 1.2K. Experimental data reveal that apart from boundary scattering of phonons, an additional scattering mechanism, interpreted as scattering of phonons at dislocations, becomes increasingly important with decreasing temperature. By considering both scattering mechanisms, they demonstrate that the boundary scattering length is indeed limited by sample dimension. Additional λ measurements in the intermediate state indicate that an as-yet-unidentified heat transport across the boundaries between normal and superconducting regions may be the reason for the considerable discrepancy between experiment and theoretical calculations. (34 refs.)

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

102573 Normal zone initiation in composite superconductors. A.L.Rakhmanov (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR).
Cryogenics (GB), vol.23, no.9, p.487-91 (Sept. 1983).
The initiation of superconducting state instability in composite superconductors due to heat disturbances is investigated. The instability development results as a rule in the transition of the superconductor into the resistive state and normal zone propagation along the conductor. It is shown that in the case of high current density, thick conductors and poor cooling the heat power necessary to initiate the instability may be small compared to the heat power necessary to warm the superconductor to the temperature of the resistive transition. (12 refs.)

102574 Electron localization and superconductivity in 2D in metals. Y.Bruynseraede, M.Gijs, C.van Haesendonck (Lab. voor Vaste Stof-Fysika en Magnetisme, Katholieke Univ. Leuven, Leuven, Belgium).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.37-45 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The magnetic field and temperature dependence of the resistance of thin Al films and Cu/Pb proximity layers has been investigated at temperatures higher than the superconducting transition temperature. The results are explained in the framework of weak localization and electron-electron interaction in the presence of superconducting fluctuations in two-dimensional disordered systems. (19 refs.)

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

102575 **Effect of energy relaxation in a superconductor on HF SQUID response.** I.M.Dmitrenko, V.A.Khlus, G.M.Tsoi, V.I.Shnyrkov.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.766-9 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The authors considered the influence of energy relaxation in a superconductor on macroscopic quantum interference effects taking place in a ring closed by a Josephson junction. It was experimentally evidenced that the behaviour of such a ring when external parameters are altered radically differs from the properties suggested by the resistive model. The effects revealed may well be explained by the microscopic theory allowing for the excitation energy relaxation time of the superconductor. (8 refs.)

102576 **First direct observation of the quantum mechanical behaviour of a truly macroscopic object.** R.J.Prance, J.E.Mutton, H.Prance, T.D.Clark (Dept. of Phys., Univ. of Sussex, Brighton, England), A.Widom, G.Megaloudis.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.789-95 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors begin by quoting the equation describing the magnetic field energy storage in a superconducting ring subjected to an external applied flux. The well known experimental technique adopted to facilitate transitions between winding-number current-carrying states is to include a 'Josephson' weak link in the ring. Quantum-mechanically, the effect of this weak link is to connect states of different winding number (referred to as the principal quantum number) by the coherent transfer of magnetic flux bundles (Φ_0) across the weak link. Quantum-electrodynamically, this transfer can be considered to constitute the second or 'conjugate' Josephson effect, by analogy with the coherent transfer of superconducting pairs through a weak link. The authors construct a Schrodinger equation to describe the infinite set of nearest-neighbour transitions. The equation makes it possible to calculate the lowest-lying energy level of the weak-link ring accurately. (6 refs.)

102577 **A superconducting flip-flop using two interacting weak links.** Lide Zhang, Yuan-Dong Dai, Y.H.Kao (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4494-501 (Aug. 1983).
Experimental results are presented showing that two superconducting indium microbridges coupled via a resistor and a capacitor can exhibit bistable states under a constant current bias, with one bridge at a finite voltage while the other is at zero voltage. The voltage states of the two microbridges can be interchanged by applying an external trigger current to the circuit. Current-voltage characteristics are compared with analog simulation as well as numerical calculation and found in good agreement. The effect of bias current, coupling resistor, capacitor, bridge resistance, and critical current values on the circuit properties are investigated. The authors' estimate for the flip-flop switching time is in the neighborhood of 0.1 nsec. (8 refs.)

102578 **Superconducting tunnel junctions on oxidized Zr_2Rh films.** M.Levinson, M.Gurvitch (Bell Lab., Murray Hill, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4683-5 (Aug. 1983).
High quality superconducting Zr_2Rh films have been produced by DC diode sputtering in Ar. Superconducting films were obtained for substrate temperatures of ~350-650°C, with the maximum values of T_c (11.2K) and resistance ratio (~26) falling in a narrower range ~550-600°C. Oxidations were performed without breaking vacuum. The best tunneling characteristics were obtained with 180 Torr sec oxygen exposure and pre- and postoxidation anneals. A ~10 Å sputtered Zr overlayer yielded additional improvement. (7 refs.)

102579 **Proximity effect and branching conditions in superconducting networks.** J.Riess (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.259-69 (Aug. 1983).
The onset of superconductivity on proximity networks made of very thin wires of different materials is investigated by adapting de Gennes' one-frequency approximation for dirty superconductors to networks. Branching conditions for the order parameter in the presence of a magnetic field H are derived, and an equation for the global critical temperature $T_c(H)$ of arbitrary networks is obtained that generalizes Alexander's equation for networks made of a single material. Numerical applications to simple proximity networks are given showing phase boundaries $T_c(H)$ and the order parameter on adjacent branches as a function of geometry and mean free path. (11 refs.)

102580 **Transient response of a nonequilibrium superconductor to pulsed injection of quasiparticles through a tunnel barrier.** I.Iguchi, A.Nishiura (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.271-87 (Aug. 1983).
The authors report the first direct measurements on the transient response of a nonequilibrium superconductor to high tunnel-current pulses. The sample is a Sn-I-Sn-I-Sn double-tunnel junction and the observed transient time is 20-30 nsec, depending on the samples. The calculated results based on the nonlinear Rothwarf-Taylor equation give a good fit to the experimental data for a reasonable set of parameter values. For injection strong enough to drive a film into the inhomogeneous gap state, the contribution of the negative diffusive term becomes important, suggesting the occurrence of an effective abnormal diffusion of quasiparticles. Measurements are also performed for the transient detector I-V characteristics at a certain sampling-gate delay time. It is shown that the inhomogeneous gap state is formed within a few tens of nanoseconds for bath temperatures both below and above T_λ. (30 refs.)

102581 **Two-dimensional imaging of hotspots in superconducting bridges by low-temperature scanning electron microscopy.** R.Eichele, L.Freytag, H.Seifert, R.P.Huebener (Phys. Inst. II, Univ. Tubingen, Tubingen, Germany), J.R.Clem.
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.449-79 (Sept. 1983).
Hotspots generated in a thin-film superconductor through dissipation of Joule energy are imaged by scanning the sample with the electron beam of a scanning electron microscope equipped with a liquid He stage. The signal utilized for imaging is the change of the sample voltage caused by the beam irradiation. A theoretical analysis of the heat balance equation indicates that the voltage signal reaches a maximum at the hotspot boundaries where the temperature profile passes through the critical temperature value of the superconductor. The predictions of the authors' theoretical model agree well with experiments performed using films of pure Sn, O_2-doped Sn, and O_2-doped Al. The width of the signal peaks marking the hotspot boundaries is twice the thermal healing length of the film/substrate configuration. (15 refs.)

102582 **Tunnelling-conductivity anomalies at low bias voltages in a magnetic field.** B.L.Al'tshuler, A.G.Aronov (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.3, p.175-8 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.145-7 (5 Feb. 1983).
The imposition of a magnetic field gives rise to a structure at a value of eV equal in modulus to the Zeeman splitting for a conduction electron in addition to the anomalous behaviour of the tunnelling conductivity at a zero bias voltage *V*. The shape and height of these new structural features depend on the temperature, the spin scattering, and the details of the electron-electron interaction. The position of the structure is determined exclusively by the electron g-factor. (10 refs.)

102583 **Josephson behaviour in small normal one-dimensional rings.** M.Buttiker, Y.Imry, R.Landauer (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.365-7 (18 July 1983).
Small and strictly one-dimensional rings of normal metal, driven by an external magnetic flux, act like superconducting rings with a Josephson junction except that $2e$ is replaced by e. (11 refs.)

102584 **Thermal activation in extremely underdamped Josephson-junction circuits.** M.Buttiker, E.P.Harris, R.Landauer (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1268-75 (1 Aug. 1983).
Noise-activated escape of a particle out of a metastable well was treated by Kramers (1940), who derived results covering the three cases of heavy damping, moderate damping, and extreme underdamping. In the case of extreme underdamping, the escape occurs through diffusive motion along the energy coordinate. The authors extend Kramers's treatment of this extremely underdamped case to cover a wider range of damping constants, taking into account that at energies just above the barrier peak and within the initial well, the distribution is controlled both by uphill diffusion in energy, and by the flow out of the well. This new result is compared with computer simulations of escape events for the case of Josephson junctions under constant current bias. In addition to a conventional simulation which initially puts the particles at the bottom of the well, a method is developed which requires simulation only in an energy range close to the peak of the barrier. (26 refs.)

102585 **Fiske steps in Josephson junctions.** Jhy-Jiun Chang (Dept. of Phys., Wayne State Univ., Detroit, MI, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1276-80 (1 Aug. 1983).
A theoretical study of the Fiske steps in superconductor-insulator-superconductor tunnel junctions has been carried out. When the amplitude of the excited cavity mode is small, the result reduces to that obtained by Eck et al. (1964) and Kulik (1965). However, when the excitation amplitude is large, the author has found current-voltage characteristics qualitatively different from those previously obtained by Kulik. Furthermore, the maximum current-step height calculated was $0.38 I_0(T)$, slightly larger than $0.34 I_0(T)$ previously obtained by Kulik. He has also obtained the details of the dependences of the current-voltage characteristics on the applied magnetic field and the damping factor of the cavity mode in the junction. (14 refs.)

102586 **Josephson tunneling and the proximity effect.** V.Z.Kresin (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1294-303 (1 Aug. 1983).
Josephson junctions containing one or two proximity systems (e.g., S_α-M_β-I-S_γ, S_α-M_β-I-M_γ-S_δ; $M_{\beta(\gamma)}$ is a normal metal or superconductor) are studied. An analysis of thickness and temperature dependences of the maximum DC Josephson current I_M is carried out. The curvature of the function $I_M(L_\beta)$ is found to depend strongly on the ratio of energy gaps $\varepsilon_\gamma/\varepsilon_\alpha$ and on the temperature. The analysis is based on the thermodynamic Green's-function method, and the effect of strong coupling is also taken into account. If the proximity system contains two superconductors S_α and S_β, then it appears that the electron-phonon interaction described by the constant λ_β contributes noticeably even if $T > T_{c\beta}$. (40 refs.)

102587 **Report on the driven Josephson equation.** J.A.Sanders (Subfaculteit Wiskunde en Informatica, Vrije Univ., Amsterdam, Netherlands).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.297-8 (2 refs.)

102588 **The peculiarities of electrical resistance behaviour in the superconductor intermediate state with paramagnetic effect.** V.A.Frolov.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.710-13 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
It is shown that paramagnetic effect in the superconductor intermediate state causes the decrease of its electrical resistance. (9 refs.)

102589 **Surface resistance due to trapped magnetic flux of superconducting lead at *X*-band.** T.Momose, T.Yamashita, Y.Onodera (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
J. Appl. Phys. (USA), vol.54, no.7, p.4044-9 (July 1983).
The surface resistance due to trapped magnetic flux of superconducting lead at *X*-band is described. A TM_{010} mode cavity was prepared by deep drawing copper substrates and electroplating lead on the substrates. Measurements were made on the cavity at RF input power less than 3 mW. Residual surface resistance values of 0.06 and 7.4 $\mu\Omega$ were obtained. The apparent surface resistance $[R(H,T)]$ of lead due to the trapped magnetic flux has a temperature dependence of $(1-t^2)^{-1}(1-t^4)^{-1/2}$ at $t=T/T_c<0.6$ and a relationship is established for trapped flux field dependence, $R(H,T) \propto 2S_c R_H$, where R_H is the surface resistance of lead due to trapped flux and S_c is the cross section area of the cavity to the field direction. A new equation for $R_H(T=0)$ is given as $R\ (H,T=0) \times (S_{tot}/2S_c)$. The results prepared using the new equation show good agreement with the published results shown to date for superconducting lead cavities having differences in mode, structure, and frequency. To obtain $R_{res} \leq 0.001\ \mu\Omega$, an ambient magnetic field should be set less than 1 mG. The field dependence of $R\ (H,T)+R_{res}$ in the case of $R_{res}=7.4\ \mu\Omega$ approaches gradually to that of $R_{res}=0.06\ \mu\Omega$ as the field increases. A model to explain the relationship between the two cases is also described. (10 refs.)

102590 Determination of microscopic parameters by macroscopic measurements in superconductors. I.Kirschner, K.Sajo (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.313-19 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Macroscopic magnetic measurements were performed on superconducting alloys. From the results of these experiments microscopic parameters namely the energy gap and the vortex creation energy could be calculated. Their dependence on the additive material content (or on the GL-parameter) was determined. It was shown that the BCS and the GLAG theory are applicable for small-κ superconductors in wide temperature interval. (15 refs.)

102591 Excitation of resistive domains in a superconducting film. Yu.M.Ivanchenko, P.N.Mikheenko (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
JETP Lett. (USA), vol.37, no.4, p.217-19 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.182-4 (20 Feb. 1983).
Penetration of vortices into a current-carrying superconducting film is observed for the first time. The distribution of the transport current over the width of the specimen and temperature distribution in the vicinity of the resistive domains are reconstructed experimentally. (6 refs.)

102592 Investigation of the influence of the heat treatment and forming regimes on the critical current and pinning force of NbTi superconductors. J.Hoellrich, G.Kath (Veb Halbzeugwerk Auerhammer, Aue, Germany).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.331-6 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The results obtained in the optimization of NbTi superconductors are set forth. The intermediate annealing temperature is discussed and the influence of final forming on the critical current density and the reduced pinning forces is studied. For the types of conductors investigated (1, 19, 55-core conductors), the j_c-maximum occurs at different degrees of final forming; it drops as the filament diameter decreases. As to the reduced pinning force, an increasing in the number of cores or a reduction of the filament diameters results in a displacement of the maximum and, for optimized conductors, an extension of the maximum towards higher fields is obtained. A final heat treatment makes the j_c-values drop. (9 refs.)

102593 Statistical theory of pinning in superconductors including correlations in the defect distribution. S.Takacs (Inst. of Electrical Engng., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.337-45 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The statistical theory of pinning on randomly distributed weak pinning centres with small densities is developed. In addition to the randomness in the spatial distribution of the defects, some correlation effects in the defect distribution are included. The results are in good agreement with experiments not only qualitatively (the volume pinning force proportional to the defect density), but also quantitatively. (32 refs.)

102594 The pinning of vortex lines in very dilute superconductors. I.Kirschner, K.Martinas (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.347-51 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
In a one dimensional model the possibility of synchronization of the flux line system to the randomly distributed pinning centres is shown. The result yields direct summation without threshold in the very dilute case. (11 refs.)

102595 Experimental determination of pinning forces. J.Bankuti, E.Farkas (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.353-60 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Four different methods are given for the determination of the pinning forces: critical current measurements, magnetization measurements and two AC methods. The measured data of the critical current density obtained by these methods are published here for the samples Nb-10 at.% Ti. (10 refs.)

102596 Flux pinning in interdiffusing thin films. W.E.Yetter, E.J.Kramer (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Philos. Mag. B (GB), vol.48, no.1, p.1-12 (July 1983).
Large changes in the flux pinning force and critical fields have been observed during room-temperature interdiffusion of a polycrystalline Pb-18% Bi film with a coating of either Pb or Tl. The flux pinning evolution is highly dependent on the reduced field $h \equiv H/H_{c2}$. In Tl-coated films the transverse flux pinning force $F_{p\perp}$ (i.e. measured with the applied magnetic field H normal to the film surface) increases rapidly with ageing, then slowly declines. In Pb-coated films $F_{p\perp}$ also rises and falls, although in a different manner; for $h \geq 0.5$, in fact, there is a brief initial period during which $F_{p\perp}$ declines. These phenomena are attributed to the growth of localized variations modify the intrinsic local perturbation in the electron mean free path (and the Ginzburg-Landau parameter κ) which is produced by the grain boundary itself (Zerweck 1981), and thus alter $F_{p\perp}$. Calculations based on an electron-scattering-flux-pinning model are compared qualitatively with the observed $F_{p\perp}$ evolution. The model and the experimental evidence both indicate that impurity segregation at grain boundaries should not, by itself, enhance flux pinning. The authors conclude that controlled interdiffusion via grain boundaries should offer a novel means of enhancing flux pinning in technologically important materials. (14 refs.)

74.60J Critical currents

102597 V_3Ga superconductors with a high critical current density. K.Fischer, S.Rohr, J.Monch, W.Holzhauser, C.Frenzel (Central Inst. of Solid State Phys. & Materials Res., Acad. of Sci., Dresden, Germany).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.305-12 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The effect of In, Zn and Mn additions to the bronze matrix on formation rate, critical current density, and critical temperature of V_3Ga layers in bronze-processed V_3Ga wires has been investigated. The V_3Ga layers were produced by heat treatment at 600...650°C within a period of 20...200 h. For a given heat treatment condition the critical current density (j_c) of the V_3Ga phase and the critical current (I_c) of In-containing conductors with a suitable composition of bronze (e.g. 16 at.% Ga, 1.2 at.% In) are considerably higher (by the factor ≥ 1.7) than those of conductors with a usually applied, binary Cu-Ga alloy containing 19 at.% Ga. The critical temperature of In-containing samples is relatively high and approaches values up to 15.4K (for which the specimens showed half its normal-state resistance). Too high Ga and In contents of the matrix are unfavourable for obtaining high critical parameters. An addition of Mn (0.6 at.%) to the bronze leads to considerably thicker V_3Ga layers, however, j_c and T_c down to 13K are decreased and thus, depending on heat treatment conditions and Ga content of bronze, unchanged or reduced I_c values were obtained. Substitution of Zn for 2 at.% Ga in the matrix causes a reduction of V_3Ga layer thickness and a increase of j_c. (10 refs.)

102598 Continuous determination of the cross section area of the components of a niobium-titanium superconducting conductor. P.Dubots, P.Genevey, J.Goyer, J.C.Renard, A.Sagniez.
Cryogenics (GB), vol.23, no.9, p.495-7 (Sept. 1983).
Multifilamentary superconducting conductors, which are usually manufactured by hot extrusion and cold drawing, consist of bundles of small diameter superconducting filaments embedded in a normal conducting matrix. It is most desirable for the magnet designer as well as for the conductor manufacturer to control the uniformity of properties along the length of conductors which will be used in large magnets. In this paper the authors present a continuous monitoring of the superconducting and normal matrix areas through a non-destructive sampling procedure over the whole length of a superconducting conductor. (no refs.)

102599 Phase-slip centers in long superconducting filaments. W.J.Yeh, Y.D.Dai, Y.H.Kao (Dept.of Phys., State Univ. of New York, Stony Brook, NY, USA).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.249-57 (Aug. 1983).
The behaviour of phase slip centers and their interactions via exchange of AC and DC quasiparticles in long superconducting filaments are studied with samples fabricated by using an electron beam lithography technique. The data show that the AC decay length of quasiparticles is shorter than the DC decay length in indium at temperatures near T_c. The interactions among phase slip centers in the long filament are interpreted on the basis of critical current variations due to quasiparticle exchange, from which a DC decay length $\Lambda \approx 5.0$ μm for indium at $T/T_c = 0.992$ has been obtained. The results indicate that a phase slip center can be used as a quasiparticle detector to obtain information about other phase slip centers and their mutual interactions. (13 refs.)

102600 Magnetic coupling in granular aluminum superconducting films. K.E.Gray (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1281-5 (1 Aug. 1983).
The maximum coupling force F_{cm} in a Giaever superconducting transformer is measured in granular aluminum films at significantly higher fields and lower temperatures than in previous work. A new method to determine F_{cm} by measuring the critical current in one film only is presented. The results are in excellent quantitative agreement with the one-reciprocal-lattice-vector approximation to the theoretical analysis in its region of validity, i.e. at high fields. For low fields, F_{cm} is consistent with the temperature dependence of the low-field approximation over the entire reduced temperature ($t = T/T_c$) range ($0.36 < t < 0.96$). (14 refs.)

74.90 OTHER TOPICS IN SUPERCONDUCTIVITY

102601 RF superconducting properties of thin films on niobium. I.E.Campisi, H.Deruyter, Z.D.Farkas, E.L.Garwin, H.A.Hogg, F.King, R.E.Kirby (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3363-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors are investigating the RF properties of thin films of materials which are known to have low secondary emission coefficients, such as NbC, NbN and TiN. Preliminary measurements on the latter material have been performed by depositing a 15 nm film on parts of a doubly reentrant Nb cavity designed to favor electron multipacting which, in the uncoated cavity, occurs copiously between the posts' tips. The measurements performed with TiN films sputtered onto Nb indicate that the RF current losses are increased by the presence of the films while the dielectric losses are negligible, within the measurement sensitivity of the system. The electron multipacting cannot be excited between the posts coated with the material tested. (no refs.)

102602 Calculating damping factor of oscillations of superconducting sphere in electromagnetic suspension. A.F.Efremov.
Izv. VUZ Priborostr. (USSR), vol.26, no.6, p.72-6 (June 1983). In Russian.
A procedure is proposed for calculating the damping factor for the oscillations of a superconducting sphere suspended in a magnetic field, which can be used to establish directly the dependence of the damping factor on the structural parameters of the device under investigation. The characteristics of the oscillations are evaluated and it is established that aperiodic damping of the linear oscillations of the superconducting sphere suspended in a magnetic field can be achieved by means of passive electromagnetic damping. (5 refs.)
L.M.H.

102603 Thermoelectric effect in a superconducting torus. R.M.Arutunian, G.F.Zharkov (Theoretical Dept., Lebedev Inst. of Phys., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.480-2 (1 Aug. 1983).
It is shown that a temperature gradient in a superconducting torus should lead to spontaneous generation of magnetic-flux quanta inside the ring. This effect is much weaker in a torus than in a hollow superconducting cylinder of comparable dimensions. The flux jumps and related hysteresis effects are predicted and the connection with experiment is discussed. (11 refs.)

102604 Magnetic order and magnetogyration in $\pi(2p)$ electron systems. M.E.Lines, M.A.Bosch (Bell Labs., Murray Hill, NJ, USA).
Comments Solid State Phys. (GB), vol.11, no.2, p.73-87 (1983).
The simplest class of magnetic substances based on molecular orbitals rather than atomic wavefunctions is the $\pi(2p)$ electron system, represented by interacting oxygen molecules or O_2^- radicals. Molecular units introduce an important new degree of freedom, the orientation of the molecular axis (dumbbell). A multitude of phase transitions of crystallographic or magnetoelastic nature is thus expected even in simple systems like solid oxygen and the alkali-hyperoxides. Fascinating cooperative phenomena arise through coupled elastic, electric and magnetic interactions. The phenomenon of magnetogyration is the magnetic driving of a crystalline phase transition involving the rotation of molecular groups. The first confirmed example of this effect has recently been recognized in the alkali-hyperoxide KO_2 at ~11K. Other probable but as yet unconfirmed examples are the pyrite to marcasite phase transition in NaO_2 and the gamma to beta phase transition in solid oxygen. (28 refs.)

102605 Spin alternation in one-dimensional exchange-coupled systems: magnetic behaviour of the $(^1/_2\text{-}1)_N$ chain. M.Drillon, J.C.Gianduzzo, R.Georges (Dept. Sci. des Materiaux, CNRS, Strasbourg, France).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.413-16 (25 July 1983).
The authors report on the magnetic behaviour of exchange-coupled closed chains (rings) of increasing length made of two alternating spin sublattices $S_a={}^1/_2$, $S_b=1$. Taking into account the geometrical and spin space symmetries of such systems, the problem is shown to be tractable up to 10 spins for distinct values of the g_a/g_bn ratio between Lande factors; the results are discussed for an antiferromagnetic coupling. The limiting behaviour for the infinite chain is determined by extrapolation of the data obtained for finite rings. At very low temperatures, the analogy with the regular $S={}^1/_2$ ferromagnetic chain is underlined. (12 refs.)

75.10D Crystal-field theory and spin Hamiltonians

102606 The use of neutron polarisation analysis in determining Hamiltonians for simple ferromagnetic systems. M.Hood (Inst. Laue-Langevin, Grenoble, France).
J. Phys. C (GB), vol.16, no.23, p.4655-62 (20 Aug. 1983).
The neutron scattering cross section and neutron polarisation for scattering by single magnons are calculated for a ferromagnetic Heisenberg Hamiltonian with various kinds of anisotropy. Although in a one-magnon theory if it is not possible to distinguish between exchange and single-site anisotropies for an easy-axis system using this technique, it is found that is possible to distinguish between an exchange anisotropy and a single-site anisotropy for an easy-plane system by measuring the neutron polarisation at different scattering wavevectors. It is also possible to distinguish between easy-plane systems and easy-axis systems by measuring the neutron scattering cross section for scattering of a completely polarised beam of neutrons for one particular scattering wavevector. (11 refs.)

75.10H Ising and other classical spin models

102607 Extended high-temperature series expansions for the spin-s Ising model. S.McKenzie (Dept. of Phys., King's Coll. London, London, England).
J. Phys. A (GB), vol.16, no.12, p.2875-80 (21 Aug. 1983).
Extended high-temperature series expansions are presented for the spin-s Ising model on the face-centred cubic lattice. Series coefficients for the zero-field internal energy (U_0) and the second moment (μ_2) of the correlation function are derived, for ${}^1/_2\leq s\leq{}^9/_2$, to order 14 in the high-temperature expansion variable $K(=J/kT)$. For $s={}^1/_2$, the fourth field derivative of the free energy is calculated to order K^{14} and the magnetisation series is given to order 13 and 27 in the temperature and magnetic field variables respectively. For $s=1$ to ${}^9/_2$, the zero-field susceptibility series are derived to order K^{14}. (27 refs.)

102608 Geometry of equilibrium configurations in the Ising model. J.Cohen, L.Haskins, J.-P.Marchand (Dept. of Math., Univ. of Denver, Denver, CO, USA).
J. Stat. Phys. (USA), vol.31, no.3, p.671-8 (June 1983).
The authors derive microscopically precise identities for the geometry of small clusters in the equilibrium states of the two-dimensional Ising model with emphasis on near-critical phenomena. (4 refs.)

102609 Computer simulations of a discontinuous phase transition and percolation clusters in the two-dimensional one-spin-flip Ising model. E.Stoll, T.Schneider (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.213-15
The films 'Computer Simulation of a Discontinuous Phase Transition in the Two-Dimensional One-Spin-Flip Ising Model' and 'Percolation Clusters' show the temporal evolution of Ising spin configurations. The system is brought to nonequilibrium by an abrupt change of the applied field or temperature, and the approach to the stable equilibrium is shown. (6 refs.)

75.10J Heisenberg and other quantized localized spin models

102610 Exact excitation spectrum of the $Z_{n+1}\times Z_{n+1}$ generalized Heisenberg model. O.Babelon, H.J.De Vega, C.M.Viallet (Lab. de Phys. Theorique et Hautes Energies, Paris, France).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.283-301 (25 July 1983).
The authors describe the excitations of the generalized Heisenberg anisotropic hamiltonian to Z_{n+1} spins. They analyse the Bethe ansatz equations without assuming the existence of strings. Excited states above an antiferromagnetic ground state are described by a finite number of parameters, which verify a finite system of equations. They give the energy and momentum of the excitations. In a suitable limit they recover the spectrum of a relativistically invariant theory. (9 refs.)

102611 Relaxation in linear ferromagnetic chain. I. Phonon relaxation. V.N.Kashcheev.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.6-13 (1983). In Russian.
In the classical linear Heisenberg chain the polarization operator is calculated for the long-wave low-frequency phonon due to the spin-phonon interaction of exchange origin. The corrections traced back to the latter are found for the spin diffusion constant. (21 refs.)

102612 Formation and coupling of magnetic moments in Heusler alloys. J.Kubler (Inst. fur Festkorperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), A.R.Williams, C.B.Sommers.
Phys. Rev. B (USA), vol.28, no.4, p.1745-55 (15 Aug. 1983).
The microscopic mechanisms responsible for both the formation and coupling of magnetic moments in Heusler alloys (X_2MnY) are identified. The authors find that the X atoms (e.g. Cu, Pd) serve primarily to determine the lattice constant, while the Y atoms (e.g. Al, In, Sb) mediate the interaction between the Mn d states. There is no significant direct interaction between the Mn atoms, but the occupied d states of Mn are delocalized by their strong interaction with the X-atom d states. The localized character of the magnetization results from the exclusion of minority-spin (defined locally) electrons from the Mn 3d shell. The coupling between the localized magnetic Mn moments can be described with the Heisenberg Hamiltonian and the sign of the exchange constants results from a competition between the intra-atomic magnetic energy and interatomic Y-atom mediated covalent interactions between the Mn d states. These effects compete because the covalent mechanism is possible only for antiferromagnetic alignments, but necessarily reduces the magnitude of the local moments. The sensitive dependence of magnetic order on the occupation of the mediating p-d hybrid states accounts well for experiments by Webster in which this occupation is varied by alloying. The authors' analysis is based on self-consistent, spin-polarized energy-band calculations for Co_2MnAl, Co_2MnSn, Ni_2MnSn, Cu_2MnAl, Cu_2MnSn, Pd_2MnIn, Pd_2MnSn, and Pd_2MnSb, for both ferromagnetic and antiferromagnetic spin alignments. (30 refs.)

102613 Excitation spectrum of ferromagnetic XXZ-chains. T.Schneider, E.Stoll (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.201-12
The authors review the theoretical understanding of dynamic form factors of ferromagnetic XXZ chains as tools to probe and interpret the excitation spectrum and briefly review the history and state of the art of these spin chains. (24 refs.)

75.10L Band and itinerant models

102614 Itinerant magnetism in actinide systems. J.J.M.Franse (Natuurkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.131-45 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A survey is presented on the occurrence of itinerant-electron magnetism in actinide metals with emphasis on the uranium Laves phase- and the uranium-platinum compounds. The Laves phase compounds can be understood with concepts of magnetism that have been developed for the transition metals, including that of spin fluctuations. The absence of magnetic order in most of the uranium-platinum compounds in combination with large values for the coefficient of the electronic term in the specific heat points to a strong hybridisation of f and d electron states. The magnetic order of UPt is complex and can not simply be represented by an itinerant-electron model. (38 refs.)

102615 The high temperature series for the single-band Hubbard model in the strong correlation limit. I.. K.Kubo, M.Tada (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1345-57 (May 1983).
The high temperature series of the thermodynamic potential and the uniform susceptibility have been investigated for the single-band Hubbard model in the strong correlation limit. It is rigorously shown that the series absolutely converge both in the low density and the half-filled limit. Correct first terms have been obtained up to the ninth order in terms of the inverse temperature. Coefficients of the series are oscillating rapidly as functions of the occupation probability of electrons. (14 refs.)

102616 Itinerant-5*f*-electron antiferromagnetism in uranium nitride: A temperature-dependent angle-resolved photoemission study. B.Reihl (IBM Zurich Res. Lab., Ruschlikon, Switzerland), G.Hollinger, F.J.Himpsel.
Phys. Rev. B (USA), vol.28, no.3, p.1490-4 (1 Aug. 1983).
A 5f-like photoemission peak emerges at E_F-0.78 eV in normal emission from UN(100) upon cooling below $T_{Neel}=53$K. This is the first observation of its kind for f electrons. The authors believe that this peak arise from band states which are folded back into the new antiferromagnetic Brillouin zone owing to the doubling of the unit cell along ⟨100⟩. Isoelectronic USb, which has localized 5f electrons, does not exhibit such a temperature effect. The results suggest that UN can be described within the theory of itinerant-5f-electron antiferromagnetism. (27 refs.)

102617 Magnetic susceptibility and kinetics of 'graphitization' of glass-like carbons. D.B.Fischbach, M.E.Rorabaugh (Dept. of Mining, Metall. & Ceramic Engng., Univ. of Washington, Seattle, WA, USA).
Carbon (GB), vol.21, no.4, p.429-39 (1983).
The room temperature magnetic susceptibility (X) of glass-like carbons (GLC) from several sources has been determined as a function of heat treatment temperature (HTT) over the range 1000-3000°C. Effects of dilute ferromagnetic impurities were observed for HTT<1500°C. The impurity (probably Fe) exists in a non-magnetic form in the carbonized GLC; transforms to a ferromagnetic state with $1000\leq$HTT≤1400°C; then disappears at higher HTT. The dependence of the diamagnetism of pure GLC on HTT is characterized by a slope decrease and inflection near 1500°C and increases smoothly thereafter. $X\simeq5.2\times10^{-6}$ emu/g and is still increasing at HTT=3000°C, and the values for different GLCs with the same HTT differ by <10%. The evolution of X as a function of isothermal residence time (HTt) over the range 2400-3000°C for three GLCs was analyzed by the superposition method. Very high effective activation energies, 360-420 kcal/mole (~1500-1750 kJ/mole) were obtained and attributed to successive-activation processes of structural development required by the microstructural constraints inherent to difficult-to-graphitize carbons. Evidence was found for a small X increase due to the plastic volume dilation (density decrease) processes that occur in some GLCs at high HTT. (37 refs.)

102618 Magnetic properties and structural chemistry of ternary silicides (RE, Th, U)Ru_2Si_2 (RE=rare earth). K.Hiebl, C.Horvath, P.Rogl (Inst. fur Phys. Chem., Univ. Wien, Vienna, Austria), M.J.Sienko.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.287-96 (July 1983).
Ternary silicides (RE, Th, U)Ru_2Si_2 have been synthesized from the elements. All the compounds (RE=Y, La, Ce, Pr, Nd, Sm, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu) were found to be isotypic and to crystallize with the structure type of $ThCr_2Si_2$ (ordered derivative of the $BaAl_4$-type). The magnetic behavior of these alloys was studied in the temperature range 1.5K<T<1100K. Magnetic susceptibilities at temperatures T>300K closely follow a typical Van Vleck paramagnetism of free RE^{3+}-ions. In the case of $CeRu_2Si_2$ susceptibilities are well described for 20K<T<1100K by a Van Vleck paramagnetism of widely spaced multiplets; the observed effective paramagnetic moment $\mu_{eff}=2.12$ BM indicates a high percentage (85%) of Ce^{3+}. $SmRu_2Si_2$ yields an effective moment $\mu_{eff}=0.54$ BM, which compares reasonably well with the Hund's rule $J=5/2$ ground level for free Sm^+ and a low-lying excited level with $J=7/2$. For temperatures T>15K the magnetic susceptibility as a function of temperature follows the 'Van Vleck behavior' for free Sm^{3+}. At low temperatures ferromagnetic ordering was encountered for (Pr, Nd, Ho, Er, Tm)Ru_2Si_2, whereas antiferromagnetic ordering was observed for (Sm, Gd, Tb, Dy)Ru_2Si_2. The ordering temperatures are generally below 55K. No superconductivity was found for temperatures as low as 1.8K. (12 refs.)

102619 Transport and magnetic properties of layered rare earth disilicides. L.D.Woolf (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Solid State Commun. (USA), vol.47, no.7, p.519-23 (Aug. 1983).
The layered rare earth (RE) disilicides RE_3Si_5 with RE=Y, Er, Tm, Yb and Lu have been studied by means of AC magnetic susceptibility and AC electrical resistance measurements. Evidence for magnetic orderings have been found at 4.4K, 3.1K and 1.7K for Er_3Si_5 and at 2.1K for Tm_3Si_5. The resistance of Lu_3Si_5 was observed to drop abruptly below 7K, possibly indicating the presence of a superconducting phase. An apparent correlation was noted between the value of the room temperature resistivity and the amount of negative curvature observed in the resistivity above ~50K in these materials. (17 refs.)

102620 Reduced paramagnetism in γ-cerium. H.H.Bertschat, C.Broude, E.Dafni, F.D.Davidovsky, M.Hass, P.M.S.Lesser (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).
Solid State Commun. (USA), vol.47, no.7, p.525-7 (Aug. 1983).
The electronic structure of cerium ions in cerium metal has been investigated via time-differential perturbed angular distribution (TDPAD) measurements of the paramagnetic enhancement factor at several temperatures and zero pressure. A considerable reduction of the paramagnetic enhancement in γ-cerium was observed in comparison to systems where Ce is believed to be in the trivalent state, indicating the 4f electron to be partially delocalized. The results are discussed within the framework of the valence fluctuations concept. (20 refs.)

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

102621 Dipolar energy of a modulated structure. E.-F.Bertaut (Lab. de Cristallographie, CNRS, Grenoble, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1123-7 (25 April 1983). In French.
A method of evaluating dipolar energies in reciprocal space is presented which is applicable to modulated magnetic structures as well as to crystallographic incommensurate structures when they are modulated antiferroelectrics. The only condition imposed is that the dipole moments can be expanded in Fourier series. The modulation can be helicoidal, sinusoidal, squared, etc. (2 refs.)

102622 Neutron diffraction effects of distortion of the structure of Ni-67.7 at.% Fe alloy in a magnetically ordered state. S.F.Dubinin, S.G.Teploukhov, S.K.Sidorov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1160-4 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An analysis was made of the neutron diffraction patterns of a single crystal of Ni-67.7 at.% Fe obtained in a wide range of temperatures. The long-range ferromagnetic and antiferromagnetic ordering appeared in this alloy in a distorted lattice state. It was established that the Curie and Neel temperatures of this alloy were also the points at which structural transitions occurred. This indicated an additional distortion of the crystal on transition to a magnetically ordered state. The magnitude of such distortion clearly determined the Invar effect in this Fe-Ni alloy. (8 refs.) *A.T.*

102623 Magnetic ordering in superconductors. R.Pynn (Inst. Laue-Langevin, Grenoble, France), J.W.Lynne, J.Joffrin.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.179-88 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Several ternary rare-earth compounds display long-range magnetic order in the superconducting state. When this order is antiferromagnetic, coexistence with superconductivity occurs over a wide temperature interval. Although simple ferromagnetic order destroys superconductivity, the competition between the magnetic and superconducting states produces a magnetic modulation of several hundred Angstroms wavelength which coexists with superconductivty. The modulated state, which has been studied by neutron scattering techniques in $ErRh_4B_4$ and $HoMo_6S_8$, exists over a narrow temperature range and is replaced by a ferromagnetic, normal conducting state at low temperature. Recent small-angle, neutron-scattering experiments with $HoMo_6S_8$ have established that the magnetic order in the modulated state is of long range. Although these experiments have proven that the modulated phase is not a vortex lattice no definitive microscopic description of the phase has yet been confirmed in either $HoMO_6S_8$ or $ErRh_4B_4$. Recent neutron scattering investigations which have attempted to elucidate the nature of the modulated phase are described. (26 refs.)

102624 Magnetic properties of Cr, Mo, and W-modified Mn_3B_4. T.Ishii, M.Shimada, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
J. Chem. Phys. (USA), vol.79, no.3, p.1511-15 (1 Aug. 1983).
Magnetic properties of Cr, Mo, and W-modified Mn_3B_4 were examined, and it was found that the ferromagnetic moment of $(Mn_{1-x}M_x)_3B_4$ (M=Cr, Mo, W) increased with increasing x ($0 \leq x \leq 0.1$), but the value of the effective Bohr magnetron μ_{eff} was almost constnt for the present compositional range studied and μ_{eff} was independent of the kind of substituted elements. This result suggests that ferromagnetism of the present solid solutions is due to canting of the antiferromagnetic sublattice of Mn 2(c) atoms of Mn_3B_4. (10 refs.)

102625 Antiferromagnetic order in fluoride glasses $PbMnFeF_7$ and Pb_2MnFeF_9. A.Le Bail, C.Jacoboni, R.De Pape (Lab. des Fluorures et Oxyfluorures Ioniques, Faculte des Sci., Le Mans, France).
J. Solid State Chem. (USA), vol.48, no.2, p.168-75 (1 July 1983). In French.
Neutron diffraction experiments have been carried out on fluoride glasses '$PbMnFeF_7$' and 'Pb_2MnFeF_9' to provide informations on the magnetic short range order of M-M pairs ($M = Mn^{2+}$, Fe^{3+}). The magnetic correlation function in both glasses shows prevailing strong antiferromagnetic first neighbor interaction at 3.6 Å, and two ferromagnetic interactions at 5.4 and 6.7 Å. The structure of these glasses is described in terms of randomly linked corner-shared MF_6 octahedral chains, with Pb^{2+} in interstitial sites. (20 refs.)

102626 Crystalline and magnetic structures in $REAl_xGa_{2-x}$ systems (RE=Nd, Er; $0 \leq x \leq 2$). II. Magnetic structures. O.E.Martin, K.Girgis (Inst. fur Kristallographie und Petrographie, Eidgenossische Tech. Hochschule, Zurich, Switzerland), P.Fischer.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.231-6 (July 1983).
For pt.I see ibid., vol.37, no.3, p.228 (1983). Part II describes results on bulk magnetic properties, transition temperatures, magnetic structures and magnetic moments found for the $NdAl_xGa_{2-x}$ and $ErAl_xGa_{2-x}$ pseudoternary solid solution systems ($0 \leq x \leq 2$). Characterization techniques include electron microprobe analysis, induction magnetometer, X-ray and neutron diffraction. The authors found ferromagnetic as well as antiferromagnetic order with parallel and incommensurate spiral structures. These spiral structures are of cycloidal or triangular screw axis type. (10 refs.)

102627 The magnetic structures of $LaTiO_3$ and $CeTiO_3$. J.P.Goral, J.E.Greedan (Inst. for Materials Res., McMaster Univ., Hamilton, Ontario, Canada).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.315-21 (July 1983).
The basic features of the magnetic structures of $LaTiO_3$ and $CeTiO_3$ were determined by powder neutron diffraction. $LaTiO_3$ ($T_N = 125K$) is a type G antiferromagnet with a moment on Ti(III) of 0.45(5) μ_B at 10K. As bulk magnetic measurements indicate a weak ferromagnetic moment, a G_zF_x or G_xF_z configuration is implied. $CeTiO_3$ ($T_N = 116K$) shows more complex behaviour. At 81K only G and F type reflections are observed. The most consistent interpretation is to assign G-type configuration to Ti(III) and an induced F_z on Ce(III). Moments are 0.36 μ_B on Ti(III) and 0.4(1) μ_B on Ce(III). It is also possible to assign both G and F components to Ti(III). This demands a 'canting angle' of 34° to explain the F moment. Below 80K a C-type component develops. A model assuming a G_zF_x configuration for Ti(III) and a C_yF_x configuration for Ce(III) provides a good fit to the data. This assignment is consistent with Bertaut's symmetry considerations. Other models which violate Bertaut's rules also fit the data. (17 refs.)

102628 Theory of magnetic structure in reentrant magnetic superconductors $HoMo_6S_8$ and $ErRh_4B_4$. L.N.Bulaevskii, A.I.Buzdin, S.V.Panjukov (P.N. Lebedev Phys. Inst., Moscow, USSR), M.L.Kulic.
Phys. Rev. B (USA), vol.28, no.3, p.1370-88 (1 Aug. 1983).
Magnetic superconductors, in which the first- and the second-order phase transition to the ferromagnetic (FN) state would occur in the absence of superconductivity, are considered. The exchange and the electromagnetic dipolar interactions of localized moments and electrons as well as magnetic anisotropy are taken into account. It is shown that one realizes the transverse domainlike magnetic structure in a superconducting state (the DS phase). Transitions $S \rightarrow DS \rightarrow FN$ are considered. The proposed theory (with the second-order transition) explains well the experimental data for $HoMo_6S_8$. The experimental data on $ErRh_4B_4$ may be explained in the framework of the similar microscopic theory with the assumption that it is a first-order magnetic transition and that the critical-temperature (Θ) variations over the sample investigated by Moncton et al. [Phys. Rev. Lett. 45, 2060 (1981)] and by Sinha et al. [Phys. Rev. lett. 48, 950 (1982)] are due to inhomogeneous stresses. (37 refs.)

102629 Magnetic behaviour of RRh_3B_2 ternary borides. R.Vijayaraghavan (Tata Inst. of Fundamental Res., Bombay, India).
Curr. Sci. (India), vol.52, no.11, p.518-27 (5 June 1983).
Magnetisation studies on RRh_3B_2(R=La to Gd) ternary borides have shown that all except La containing compound order magnetically. While the magnetic behaviour of $PrRh_3B_2$, $NdRh_3B_2$ and $GdRh_3B_2$ is mainly determined by the localised rare earth moments interacting via the indirect RKKY exchange, the experimental data suggest that the magnetic ordering in $CeRh_3B_2$ and $EuRh_3B_2$ is of itinerant nature and is presumed to arise from Rh-d band. Possibly the 4f electrons of Ce and Eu also play a significant role. Preliminary resistivity studies on $CeRh_3B_2$ show that the temperature behaviour of resistivity is similar to what one would expect for a 'strongly interacting electron gas'. ^{151}Eu Mossbauer studies in $EuRh_3B_2$ show clearly that Eu ions are nonmagnetic in this compound and, therefore, magnetic ordering in this compound cannot be ascribed to Eu sublattice. Magnetisation behaviour in $SmRh_3B_2$ is rather anomalous. (26 refs.)

102630 Temperature dependences of the magnetic susceptibility, magnetization, and electrical resistivity of solid solutions of the $GdZn_xMg_{1-x}$ system. V.E.Adamyan, G.G.Karagebakyan, M.A.Melikyan, E.S.Abovyan (State Univ., Erevan, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1083-7 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A system of $GdZn_xNg_{1-x}$ solid solutions with the CsCl-type structure was synthesized. Measurements of the magnetic properties carried out in the range 77-600K showed that at low temperatures these solutions were ferromagnetic. The ferromagnetic and paramagnetic Curie temperatures were determined. At high temperatures the susceptibility obeyed the Curie-Weiss law with an effective magnetic moment close to the theoretically predicted value. The

temperature dependences of the electrical resistivity had kinks at the Curie temperatures of the solutions. (10 refs.) *A.T.*

102631 Temperature coefficients of the magnetic induction and magnetic properties of $Sm_x(R,Gd)_{1-x}Co_5$ alloys (R=Tb, Dy, Ho, Tm). O.I.Ponomareva, Ya.S.Shur, V.G.Maikov, A.G.Popov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1101-6 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A systematic investigation was made of the temperature dependences of the magnetic induction and magnetic properties of alloys formed by cobalt with samarium and with heavy rare-earth metals. The purpose was to determine the main conditions for achieving a low value of the temperature coefficient of the magnetic induction, which is one of the more important characteristics of permanent magnets. (13 refs.) *A.T.*

102632 Influence of high pressures and magnetic fields on magnetic ordering in Cr-Fe alloy. V.V.Kokorin, I.A.Osipenko, S.V.Cherepov, V.A.Chernenko (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1225-8 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Alloys of Cr containing 20 wt.% Fe were investigated. The temperature dependences of the magnetic susceptibility were recorded and the effects of a static magnetic field and of an external pressure on these dependences were studied. A transition was observed to the superferromagnetic state and the temperature of this transition was a function of the applied field. This transition occurred in a system of ferromagnetic inclusions. (9 refs.) *A.T.*

102633 On the participation of domains in the high spin ($^5T_2$)$\rightleftarrows$low spin ($^1A_1$) transition in dithiocyanatobis (2,2′-bi-2-thiazoline) iron (II). E.W.Muller, H.Spiering, P.Gutlich (Inst. fur Anorganische und Analytische Chem., Johannes Gutenberg-Univ., Mainz, Germany).
J. Chem. Phys. (USA), vol.79, no.3, p.1439-43 (1 Aug. 1983).
The hysteresis in the high spin$\rightleftarrows$low spin transition of $[Fe(bt)_2(NCS)_2]$ (bt=2,2′-bi-2-thiazoline) has been studied by magnetic susceptibility measurements in two different preparations and in a mechanically treated (ball mill) sample. From the measurement of two inner hysteresis loops and a comparison with Everett's theorems for hysteresis effects, it could be established that independent domains (i.e. groups of complex molecules of like spin that can only change their state simultaneously) participate in the spin transition in the unperturbed sample. The domains were found to be no longer independent in the milled sample. This property may result from a different limitation in the size of the domains caused by lattice defects as compared to the unperturbed sample. (24 refs.)

102634 Anisotropic magnetic susceptibility of single crystal UCl_4. E.Gamp, N.Edelstein (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), C.Khan Malek, S.Hubert, M.Genet.
J. Chem. Phys. (USA), vol.79, no.4, p.2023-6 (15 Aug. 1983).
The anisotropic magnetic susceptibilities $\chi_\parallel$ and $\chi_\perp$ of UCl_4 have been measured in single crystals between 1.6 and 350K. Powder measurements of the average susceptibility were also performed but were found to be unreliable due to orientation effects. The single crystal results were interpreted in terms of the parameterized crystal field model with the following parameters: $\zeta=1819$ cm^{-1}; $F^2=42\ 632$ cm^{-1}, $F^4=38\ 680$ cm^{-1}; $F^6=23\ 320$ cm^{-1}; $B_0^{\,2}=-1008$ cm^{-1}; $B_0^{\,4}=1730$ cm^{-1}; $B_4^{\,4}=-2704$ cm^{-1}; $B_0^{\,6}=-2705$ cm^{-1}; $B_4^{\,6}=346$ cm^{-1}; $\alpha=29$ cm^{-1}; $\beta=-638$ cm^{-1}; and $\gamma=1617$ cm^{-1}. These parameters yield a $\Gamma_4(^3H_4)$ ground state and a paramagnetic first excited state $\Gamma_5(^3H_4)$ at 110 cm^{-1} and are in good agreement with the optical spectrum. (13 refs.)

102635 Magnetic properties of $RE_2Mo_2O_7$ pyrochlores. R.Ranganathan, G.Rangarajan, R.Srinivasan (Dept. of Phys., Indian Inst. of Technol., Madras, India), M.A.Subramanian, G.V.Subba Rao.
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.481-96 (Sept. 1983).
The magnetic properties of $RE_2Mo_2O_7$ ($RE=Gd^{3+}$, Tb^{3+}, Dy^{3+}, Ho^{3+}, Er^{3+}, Tm^{3+}, and Yb^{3+}) and of solid solutions of the type $(Nd_{1-x}A_x)_2Mo_2O_7$ (A=Yb or Er; $0.05\leq x\leq 0.4$) have been studied using an AC mutual inductance bridge. All the compounds were found to exhibit magnetic ordering in the neighborhood of or below 77K. The data have been analyzed using (i) the available susceptibility data on $Y_2Mo_2O_7$, (ii) a ferromagnetic coupling among the Mo^{4+} ions to obtain the contribution from the RE^{3+} ion, and (iii) the available susceptibility data on $RE_2Ti_2O_7$ to obtain the contribution from the Mo^{4+} ions. It was found that procedure (iii) gave the most satisfactory explanation of the magnetic ordering. The results indicated that (1) the Mo^{4+} ions become ordered magnetically, (2) the behavior of the RE^{3+} ions is almost the same as in the isostructural $RE_2Ti_2O_7$ and $RE_2V_2O_7$ compounds, and (3) the susceptibility values differ appreciably as the authors go from Nd^{3+} to Yb^{3+}, possibly due to narrowing of the π*Mo-O conduction band. (15 refs.)

102636 Magnetic behavior of RRh_3B_2 (R=La to Gd) ternary borides. S.K.Malik, R.Vijayaraghavan, W.E.Wallace (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA), S.K.Dhar.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.303-8 (July 1983).
Magnetisation of the rare earth ternary borides RRh_3B_2 (R=La to Gd), which crystallize in the hexagonal $CeCo_3B_2$ type structure, has been measured in the temperature range 4.2 to 300K. The Curie temperatures have been determined from low field AC susceptibility measurements. All except $LaRh_3B_2$ order magnetically. The Gd and Nd compounds have Curie temperatures (T_c) of 91K and <20K, respectively; the effective paramagnetic moments are slightly larger than the corresponding free ion values for trivalent rare earths. The Ce, Sm and Eu compounds show unusual behavior. From unit cell volume considerations, Eu is trivalent (ground state $4f^6$; $^7F_0$) and cerium has a valence greater than 3. In spite of this, $CeRh_3B_2$ and $EuRh_3B_2$ exhibit magnetic ordering with T_c's of 108 and 40K and saturation moments of 0.38 and 0.55 μ_B at 4.2K, respectively. The magnetism in these two compounds is presumed to be of the itinerant type. The compound $SmRh_3B_2$ has a very small moment at 4.2K in 20 kOe field (0.046 μ_B) and exhibits a peculiar temperature dependence of magnetization. (13 refs.)

102637 AC magnetic susceptibility and hysteresis studies on $La_{1-x}Y_xMn_2Si_2$ intermetallic compounds. R.S.Chaughule, C.Radhakrishnamurty, E.V.Sampathkumaran, S.K.Malik, R.Vijayaraghavan (Tata Inst. of Fundamental Res., Bombay, India).
Mater. Res. Bull. (USA), vol.18, no.7, p.817-21 (July 1983).
AC susceptibility and hysteresis studies at various temperatures indicate that the ferromagnetic pseudoternary system $La_{1-x}Y_xMn_2Si_2$ ($x<0.2$) contains mixed multidomain, single domain or superparamagnetic states. The compound with x=0.2 shows a cluster spin-glass type of ordering. (12 refs.)

102638 Theory of relaxation of magnons in a two-component electron liquid in a ferromagnet. Yu.A.Milyukov, O.M.Tolkachev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1058-65 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A system of nonlinear equations of motion for a circularly polarized nonequilibrium magnetization of a two-component electron liquid in a ferromagnet with the s-d of s-f exchange interaction is used to obtain the collision integral for magnons with collective-state s and d (f) electrons. The damping decrement is found for magnons interacting with the s and d (f) electrons, as a function of the temperature and wave vector. It is shown that the contribution of the collective-state d (f) electrons to the magnon relaxation processes is considerable and the conditions are found under which the damping decrement in magnons interacting with heavy d (f) electrons is greater than or of the order of the damping decrement of magnons interacting with the light s electrons. (11 refs.) *A.T.*

102639 Parametric spin-wave excitation in amorphous ferromagnetic wires. L.Kraus, A.N.Anisimov, A.G.Gurevich, A.V.Atlasman (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
JETP Lett. (USA), vol.37, no.2, p.123-6 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.100-3 (20 Jan. 1983).
A parametric excitation of spin waves has been observed during transverse pumping in amorphous thin ferromagnetic wires. This excitation is made possible by an induction 'intensification' of the magnetic field through the placement of the sample at an antinode of the electric field of a microwave resonator. (11 refs.)

102640 Magnetic excitations in the incommensurate phases of chromium metal. S.K.Burke, W.G.Stirling, K.R.A.Ziebeck (Inst. Laue-Langevin, Grenoble, France), J.G.Booth.
Phys. Rev. Lett. (USA), vol.51, no.6, p.494-7 (8 Aug. 1983).
The excitation spectrum of the incommensurate spin-density wave in chromium metal has been investigated by neutron scattering. It is found that the high-velocity mode originating from the magnetic satellite positions is not a simple spin wave but at low frequency is a longitudinal excitation. Additional excitation branches, which cross at the (100) position at a frequency corresponding to the 'commensurate' feature seen in previous studies, were also observed. (15 refs.)

102641 Collective behavior of magnons in superlattices. M.Grimsditch, M.R.Khan, A.Kueny, I.K.Schuller (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.498-500 (8 Aug. 1983).
The magnon spectrum characteristic of collective behavior in magnetic/nonmagnetic superlattices has been observed, and is in good agreement with theoretical predictions. (9 refs.)

102642 Surface spin waves in antiferromagnets. B.Luthi, D.L.Mills (Phys. Dept., Univ. of California, Irvine, CA, USA), R.E.Camley.
Phys. Rev. B (USA), vol.28, no.3, p.1475-9 (1 Aug. 1983).
A complete theory for dipolar antiferromagnetic surface spin waves is given. Analytic forms are derived for the dispersion relation and regions of stabiliy. Applications to representative uniaxal antiferromagnets (MnF_2, $GdAlO_3$, FeF_2) are shown and possible experimental methods for verification are discussed. The case of exchange-dominated antiferromagnetic surface spin waves is briefly mentioned. (17 refs.)

102643 Kinetic description of collective oscillations in a system of parametric spin waves. II. Inhomogeneous collective modes. V.G.Morozov, A.N.Mukhai (Moscow Inst. of Civil Aviation Engrs., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1142-9 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.305-17 (Nov. 1982).
For pt.I see ibid., vol.51, p.234 (1982). On the basis of the linearised kinetic equations obtained in Part I, spatially inhomogeneous collective oscillations in a system of parametric spin waves of a ferromagnet are considered. It is shown that the spectrum $\Omega_m(\kappa)$ of such oscillations depends on the relationship between the wave number κ of the oscillations and the spreading Δk of the packet of parametric waves in the k space. An investigation is made into the behaviour of the spectrum $\Omega_0(\kappa)$ of an inhomogeneous zero-order mode near the stability boundaries of the isotropic stationary state and the anisotropic stationary states. Criteria of stability of the stationary states with respect to excitation of the inhomogeneous zero-order mode in the long-wavelength ($\kappa\ll\Delta k$) and short-wavelength ($\kappa\gg\Delta k$) regions of the spectrum are obtained. For higher modes with $m\neq 0$, the spectrum of longitudinal ($\kappa\parallel M_0$) long-wave and short-wave collective oscillations is found. (9 refs.)

75.30E Exchange and superexchange interactions

(see also 71.70 Level splitting and interactions)

102644 Exchange anistropy of polycrystalline alloy $FePd_2Au$. M.A.Borozdina, Yu.G.Karpov, Yu.A.Vereshchagin, F.A.Sidorenko, V.M.Pavlov, P.V.Gel'd (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1112-16 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of hysteresis loops of the alloy $FePd_2Au$ ion states intermediate between ferromagnetic and antiferromagnetic, achieved by atomic ordering. Cooling in a magnetic field at low temperatures resulted in considerable broadening and the strong shift of the hysteresis loops. This was attributed to a strong exchange anisotropy due to the coexistence, in the intermediate magnetic structures, of ferromagnetic and antiferromagnetic regions. (12 refs.) *A.T.*

102645 On the interference of superexchange interactions. I.Mayer, S.A.Angelov (Central Res. Inst. for Chem., Hungarian Acad. of Sci., Budapest, Hungary).
J. Phys. C (GB), vol.16, no.23, p.L857-8 (20 Aug. 1983).
An improved treatment of the problem of non-additivity in superexchange is proposed. It is stressed that the description of the interference does not require the postulation of any new superexchange mechanisms. (3 refs.)

102646 In-plane next-nearest-neighbour exchange coupling in uniaxial metamagnets: its influence on the low-temperature self-energy. E.Rastelli, A.Tassi (Istituto di Fisica, Univ. di Parma, Parma, Italy).
J. Phys. C (GB), vol.16, no.23, p.4663-77 (20 Aug. 1983).
The ladder approximation is performed for metamagnets with uniaxial and exchange anisotropy and the following exchange couplings: in-plane nearest-neighbour ferromagnetic coupling J_1, in-plane, next-nearest-neighbour antiferromagnetic coupling J_2, and small interplane antiferromagnetic coupling J'. Taking J_2 into account encounters non-trivial difficulties but the authors have tackled this problem because a suitable lattice-dependent value of $J_2=J_2$ causes the long-wavelength magnon dispersion curve to become a quartic power of the wavevector instead of a quadratic one, so one can expect dramatic consequences. In effect this is the case: the results the authors obtain for $FeBr_2$, which has just the convenient ratio J_2/J_1 to fit the situation described above, give weak renormalisation and damping for the uniform mode, while for $FeCl_2$ dramatic variances, at least from a quantitative point of view, do not arise with respect to previous approahces, where J_2 was neglected. Such a result cannot be inferred on the basis of a finite-order perturbation theory which, on the contrary, would suggest a heavier renormalisation when the dispersion curve is more flat for small wavevectors, as in $FeBr_2$. (20 refs.)

102647 Off-diagonal s-d coupling and red shift of absorption spectra in magnetic semiconductors. V.Capek, V.Szocs, I.Barvik (Inst. of Phys., Charles Univ., Prague, Czechoslovakia).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.277-82 (July 1983).
Using the method of moments, it is argued that the strong coupling s-d model gives an appreciably enhanced red shift of the quasiparticle density of states with temperature due to even a weak off-diagonal s-d coupling contribution as compared to the case with only a diagonal coupling. The result is used to interpret the red shift in chromium chalcogenide spinels. (19 refs.)

102648 Ferromagnetic intra-sublattice exchange in multicomponent ferrites. N.L.Pakhomova (Moscow Inst. of Transport Engng., Moscow, USSR), L.M.Kasimenko, V.Christoph.
Phys. Status Solidi a (Germany), vol.78, no.1, p.111-14 (16 July 1983).
Comparing the calculated temperature dependence of the magnetization of $Ni_{1-x}Zn_xFe_2O_4$ ferrites with the experimental curves measured on monocrystals the exchange integrals and their concentration dependence are determined. For the calculation a modified statistical model with three sublattices is used. The exchange interaction between the octahedral Fe^{3+} and Ni^{2+} ions is shown to be ferromagnetic. (16 refs.)

75.30G Anisotropy

102649 Magnetic anisotropy of Cr_5Te_8 single crystal. M.Akram (Dept. of Phys., Punjab Univ., Lahore, Pakistan), F.M.Nazar.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.441-3 (Aug. 1983).
The authors have measured the magnetization as a function of magnetic field and temperature along different directions in a single crystal of Cr_5Te_8. A large anisotropy has been observed in these samples. This anisotropy may be due to a change in the symmetry of nearest neighbour surrounding of chromium cations. (8 refs.)

102650 Influence of titanium on magnetic properties and structure of iron-chromium-cobalt alloys. Yu.I.Kozlov, Z.A.Rakitina (Sci.-Res. Inst. of Permanent Magnets, Novocherkassk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1223-5 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the influence of of Ti on alloys of the compositions 62 wt.% Fe-12% Co-26% Cr and 63% Fe-10% Co-27% Cr. The dependences of the magnetic properties on the titanium concentration indicated that the optimal amount of Ti was 2 and 2.5% for the first and second alloys, respectively. These concentrations ensured the highest value of the product $(BH)_{max}$. The addition of titanium suppressed the γ phase and increased the shape anisotropy of the strongly magnetic α_1 phase. (6 refs.) *A.T.*

102651 Spin-glass behavior as a fuction of concentration and local order by NMR in nearly random NiMn systems. J.Schaf (Phys. des Solides, Univ. Paris-Sud, Orsay, France), K.Le Dang, P.Veillet.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.297-302 (July 1983).
Unidirectional anisotropy fields (H_A) in disordered $Ni_{100-x}Mn_x$ ($25 \leq x \leq 32$) systems after field cooling are found by NMR (spin echo) to be very sensitive to the Mn concentration and to local order. The H_A increases by roughly a factor of 10 when the concentration increases 5%. The Mn NMR spectra show that all Mn have several first nearest Mn neighbours. For a given concentration, in the above range, the H_A are very sensitive to the annealing-quenching temperatures (T_{AQ}) and vanish when the sample is cooled down from 900°C in 2 h. The NiMn system can be tuned by heat treatments from a spin glass to a ferromagnet. The Mn NMR spectra with decreasing T_{AQ} show a clear metallurgical evolution tending to states where a Mn atom sees fewer first nearest Mn neighbours. Evidence is found that the anisotropy has its roots in atomic randomness. (15 refs.)

102652 Magnetic anisotropy and exchange interactions in Li-Al ferrites. N.L.Pakhomova, V.A.Kozlov (Moscow Railroad Transport Engrs. Inst., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1022-5 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.54-7 (Nov. 1982).
The mechanism of exchange interactions in Li-Al ferrites is examined along with the nature of the magnetic crystallographic anisotropy. Calculation from a modified statistical model and another from Wolf's model may be used with observed curves for the temperature dependence of the magnetization and the first magnetic crystalline anisotropy constant to obtain values for the exchange integrals and the spin-Hamiltonian parameter SHP for Fe^{3+}. It is shown that the SHP are substantially influenced by the exchange interactions, and the concentration relationships cannot be explained within the framework of the ionic crystalline-field theory. 75.30H Magnetic impurity interactions

102653 Influence of V on the Fe site spin and charge densities in BCC-iron. S.M.Dubiel, W.Zinn (IFF, KFA, Julich, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.237-45 (July 1983).
Using the Mossbauer effect the authors studied the influence of substituting iron atoms by vanadium atoms on the Fe site HF field and isomer shift for a series of Fe-V alloys containing up to 18 at.% V. The two quantities are correlated with each other and also the average HF field $\bar{H}$ is correlated with the average number of V atoms in the vicinity of the Fe nuclei $\bar{N}$. Based on the former correlations the authors were able to determine the hyperfine coupling constants to be equal to: a) 1735 kOe/s-el for itinerant s-like electrons, b) 3240 and 3450 kOe/s-el for the s-electrons localized in the first- and second-neighbour shell, respectively, and c) 3090 kOe/s-el, the average value. Using the estimated HF coupling constants and based on the $\bar{H}$-$\bar{N}$ correlation the disturbance of the spin or charge density per one V atom per unit cell, η, was calculated to be equal to 0.048. The results are compared with those obtained previously for other substitutes and they are discussed in terms of Friedel's and Stearns' models. (11 refs.)

75.30K Magnetic phase boundaries

(inc. magnetic transitions, metamagnetism, etc)

102654 Magnetic properties of ordered $Fe_{1-x}Mn_xPd_3$ alloys. B.V.Cherkashin, Yu.A.Vereshchagin, A.A.Kuranov, P.V.Gel'd (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1133-7 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The magnetic properties of atomically ordered $Fe_{1-x}Mn_xPd_3$ alloys were investigated in the temperature range from 4.2 to 600K. The results were used to plot for the first time the magnetic phase diagram with composition regions characterized by the ferromagnetic ($0.70 \leq x < 1$) and antiferromagnetic ($0 < x \leq 0.70$) long-range order. A spin glass component was observed near the magnetic phase transition. (12 refs.) *A.T.*

102655 Magnetic phase transitions in ordered $(Fe_{1-x}Mn_x)Pt$ alloys. G.P.Gasnikova, Yu.A.Dorofeev, A.Z.Men'shikov, S.K.Sidorov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1138-42 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A neutron-diffraction investigation of alloys corresponding to the quasibinary FePt-MnPt line, subjected to annealing to ensure a fully ordered state, was carried out in the temperature range 4.2-800K. It was found that the composition-dependent ferromagnetic-antiferromagnetic phase transition occurred in $(Fe_{1-x}Mn_x)Pt$ alloys, characterized by the base-centred tetragonal magnetic lattice, via an intermediate collinear antiferromagnetic structure characterized by the wave vector $\mathbf{K}=(1, 0, 1/2)$. The Curie and Neel temperatures were determined for the observed magnetic structures and a complete magnetic phase diagram was plotted. It was concluded that noncoplanar magnetic structures occurred in the region of transition from one type of magnetic order to another. (14 refs.) *A.T.*

102656 Metamagnetism of a noncollinear antiferromagnet: the Jahn-Teller garnet $Ca_3Mn_2Ge_3O_{12}$. Z.A.Kazei, N.P.Kolmakova, D.I.Sirota, V.I.Sokolova (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.5, p.285-9 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.240-3 (5 March 1983).
The metamagnetic phase transition in the crystal $Ca_3Mn_2Ge_3O_{12}$, induced by an external magnetic field, is investigated with the help of magnetostriction measurements at 4.2K. The unusual phase diagrams in the (001) and (010) planes, obtained in the experiment, are described by a model of an anisotropic metamagnet with four local anisotropy axes. (7 refs.)

102657 Quenching of the phase transitions in MnAs and related compounds. J.Tebbe, K.Barner (IV Phys. Inst., Univ. Gottingen, Gottingen, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.283-6 (July 1983).
The first- and second-order phase transition in MnAs and related compounds can be suppressed by rapid roller quenching. The magnetic behaviour of the resulting new metastable phases indicates a mixed double exchange-superexchange magnetic coupling for these compounds. (14 refs.)

102658 The behaviour of an amorphous ferromagnet with dilution. A.Bobak (Dept. of Theoretical Phys. & Geophys., P.J. Safarik Univ., Kisice, Czechoslovakia).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K61-3 (1 July 1983).
The present work is an extension of the author's previous treatment (1982), motivated by the suspicion that the physical problem was inadequately represented because the fluctuations of the effective field, which represent a characteristic feature of disordered systems and are a consequence of the concentration and structure fluctuations, were neglected. It is obvious that the effective field acting on given 'first shell' magnetic atom takes various values depending on the occupation of the magnetic atoms in the surrounding layer or 'second shell' of the cluster. For this reason, they assume that a 'fist shell' magnetic atom i is subject to an effective field proportional to the number of magnetic n_i that it has outside the cluster. For this reason, they assume that a 'first shell' magnetic atom is subject to an effective field proportional to the number of magnetic neighbours n_i that it has outside the cluster. Thus, the effective field acting on magnetic atom i is taken to be n_iH_1, where $n_i=0, 1, 2, ..., z_i-1$, and the local coordination number, z_i, is a stochastical variable due to the amorphous structure. (6 refs.)

102659 Magnetic properties of the $Cr_{7-x}Fe_xTe_8$ (x=0 to 3) system. G.I.Makovetskii (Inst. of Phys. of Solids & Semiconductors, Acad. of Sci., Minsk, Belorussian SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K39-41 (16 July 1983).
Results on X-ray and magnetic studies of the alloy properties of the $Cr_{7x}Fe_xTe_8$ (x=0 to 3) system are reported. The X-ray structural study of the powder specimens in CuK_α radiation indicates that the range of solid solutions with the NiAs-type structure in the investigated system occurs in the concentration range x=0 to 2. The determined unit cell constants of the alloys, the values of Curie temperature and those of the effective magnetic moment calculated from the temperature dependence of the saturation magnetization are listed. The magnetization measurements were performed in the temperature range from 20 to 400K at fields up to 2 T. The Curie temperatures were obtained by extrapolating the magnetization versus temperature curves to a magnetic field strength of 0.8 T. (2 refs.)

102660 Exchange-striction mechanism of phase transitions in magnetic crystals. K.A.Dyul'dina, V.A.Gordienko (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.927-8 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.76-8 (Nov. 1982).
The authors propose a mechanism for magnetic phase transitions of the ferromagnetic-antiferromagnetic type which incorporates the dependence of the exchange interactions on the cation-antion-cation angles. They treat the specific case of compounds having a single type of magnetically active ions which crystallize in the NiAs structure. In the analysis of the transitions it is assumed that the main contribution to the exchange energy is from the interaction of cations located in the same basal plane, i.e. the exchange parameters I_{ij} of the competing exchange interactions between cations i and j on neighboring basal planes, at least one of which depends mainly on the cation-anion-cation angle ϕ, have almost the same magnitude. (5 refs.)

102661 Magnetic transition state in metals; the Curie temperature of nickel. A.I.Likhtenshtein, M.I.Katsnel'son, V.I.Anisimov, V.A.Gubanov (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.929-30 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.79-82 (Nov. 1982).
The authors propose a method for the magnetic transition state of metals that permit non-empirical calculations of the local spin excitations in systems having a continuous spectrum of d-states and an arbitrary type of magnetic interactions. Since flipping the spin of one of the atoms breaks the translational invariance of the crystal, the magnetic transition state cannot be calculated by the usual band methods. Cluster approaches, which give a good description of the local excitations in dielectrics, require the examination of large clusters when applied to the collectivized d-states of metals. In calculating ΔE for nickel they therefore used the $X\alpha$ scattered-wave method with k-dependent boundary conditions, which makes it possible to model correctly the structure of delocalized states by considering even small groups of atoms. 102662 Numerical simulation of a phase transition in the nuclear spin system of gallium arsenide with adiabatic demagnetization. S.I.Vasil'ev, L.A.Kalmykova, I.A.Merkulov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.77-80 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.65-7 (20 Jan. 1983).
The results of a calculation of the phase-transition temperature (T_c), of the ground state of the nuclear spin system of GaAs, and of the process of adiabatic demagnetization of this system in the temperature range below T_c are presented. (5 refs.)

102663 Investigation of the characteristics of a thermomagnetic recording on films of 3d-4f metallic alloys. A.E.Gafner, T.S.Kuli-zade, E.A.Podpalyi, G.I.Rusov, V.T.Sukhomlin, S.O.Shilyadov.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.204-8 (May-June 1983). In Russian.
The authors investigate the energy sensitivity and energy range of thermomagnetic recording on amorphous films of CdCoX and CdFe, where X=Ni or Mo. It is shown that in the case of specimens with point of compensation above room temperature the recording has a threshold character. The authors examine the form of the recording for a comparatively high energy laser pulse. High resolution interferograms (500 lines/mm) are obtained and the diffraction efficiency was measured. (12 refs.)

75.40 CRITICAL-POINT EFFECTS, SPECIFIC HEATS, SHORT-RANGE ORDER

(inc. spin glasses)

102664 Magnetic correlations in metallic magnetics at finite temperatures. K.R.A.Ziebeck, P.J.Brown (Inst. Laue-Langevin, Grenoble, France), J.Deportes, D.Givord, P.J.Webster, J.G.Booth.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.117-30 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Neutron scattering measurements confirm that the exchange splitting in iron and other itinerant magnets persists beyond T_c into the paramagnetic phase. Measurements both close to the ground state and in the paramagnetic phase demosntrate the importance of quantum fluctuation which in the case of itinerant magnets are not distinct from the thermal fluctuations. Inelastic neutron scattering measurements close to the ground state indicate that the transverse fluctuations of the magnetisation density are confined to a small value of reciprocal space. Furthermore, measurements made above T_c indicate that the region of spin wave fluctuations remains unchanged. These results are consistent with the predictions of band theory which also suggests the presence of a low level of scattering towards the zone boundary and extending up to the band width. The absence of significant scattering towards the zone boundary has been confirmed by paramagnetic neutron scattering measurements in both iron and nickel. These fluctuations have the same origin as those characterising the static susceptibility in the paramagnetic phase of chromium. (23 refs.)

102665 Magnetisation profiles for anisotropic spin glasses. D.Elderfield (Blackett Lab., Imperial Coll., London, England).
J. Phys. A (GB), vol.16, no.11, p.L385-93 (1 Aug. 1983).
The thermodynamic (field cooled) magnetisation is analysed throughout the spin glass domain (transverse T, longitudinal L or mixed LT phases) for a class of anisotropic *m* vector models, in the limit of a small collinear field. In zero field the field cooled susceptibility $\chi_T(\chi_L)$ is independent of temperature throughout the T (L and LT) phases. In a finite collinear field the author observes the celebrated Parisi '$h^{4/3}$' dependence of the field cooled magnetisation throughout the L and LT phases. For the T phase no simple characterisation is apparent. (19 refs.)

102666 On phase separation in systems with continuous symmetry. N.Angelescu (JINR-Dubna, Moscow, USSR), M.Bundaru, G.Costache.
J. Phys. A (GB), vol.16, no.11, p.2479-95 (1 Aug. 1983).
It is proved that the interface in the isotropic *D*-vector model and its $D\rightarrow\infty$ limit, both with Kac-Helfand interactions (1962), is diffuse at all temperatures. The Sinterface does not stabilise even when a pinning potential of Abraham type (1980) is accommodated. The magnetisation profile is explicitly calculated and the interface width is shown to be proportional to the sample thickness. (21 refs.)

102667 Field and anisotropy effects in spin glasses. I. The collinear case. D.Elderfield, D.Sherrington (Dept. of Phys., Imperial Coll., London, England).
J. Phys. C (GB), vol.16, no.24, p.4865-88 (30 Aug. 1983).
A theoretical analysis is given for the phase structure of a vector spin-glass model in the presence of local uniaxial anisotropy and/or coaxial external magnetic fields and/or spontaneous mean ferromagnetism. Replica analysis is used, including generalisations of Almeida-Thouless stability analysis and of Parisi treatment of replica-symmetry breaking. Phase transition points, lines and surfaces are found, as also irreversibility crossovers. Spin-glass phases include longitudinal, transverse and mixed; ferromagnetic include collinear and randomly canted (ferromagnet plus transverse spin glass). All spin-

glass-type phases are accompanied by ergodicity-breaking of the corresponding symmetry while transverse ordering in a field is also accompanied by weak longitudinal irreversibility, followed by crossover to stronger irreversibility at a lower temperature. (40 refs.)

102668 A probabilistic approach to the models of spin glasses. A.Suto (Central Res. Inst. for Phys., Budapest, Hungary), T.Yalcin, C.Gruber.
J. Stat. Phys. (USA), vol.31, no.3, p.639-59 (June 1983).
Introducing the notions of quenched and annealed probability measures, a systematic study of some problems in the description of spin glasses is attempted. Inequalities and variational principles for the free energies are derived. The absence of spontaneous breakdown of the gauge symmetry is discussed and some high-temperature properties are studied. Examples of annealed models with more than one phase transition are shown. (13 refs.)

102669 Itinerant electron magnetism in the Mo_4 tetrahedral cluster compounds $GaMo_4S_8$, $GaMo_4Se_8$, and $GaMo_4Se_4Te_4$. A.K.Rastogi, A.Berton, J.Chaussy, R.Tournier (Univ. Sci. et Medicale de Grenoble, Grenoble, France), M.Potel, R.Chevrel, M.Sergent.
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.539-57 (Sept. 1983).
The specific heat and magnetic properties of $GaMo_4X_8$ (X=S, Se, SeTe) between 1.4 and 290K are reported. The measurements tend to demonstrate that these compounds have a very high density of states, leading to a Stoner magnetic instability of conduction electrons at low temperatures. The linear temperature-dependent term in the specific heat is enhanced by electron-phonon coupling and spin fluctuation effects. These compounds could indicate an electron-phonon contribution to the Stoner enhancement factor. (14 refs.)

102670 Comments on the use of the Landau theory in some order-order transitions. J.A.Tuszynski (Phys. Dept., Univ. of Calgary, Calgary, Canada).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.358-60 (18 July 1983).
The application of Landau theory of phase transitions to a two-sublattice magnet results in a broad range of magnetic transitions. The use of a two-component order parameter enables one to describe both order-disorder and order-order transitions. In particular, the metamagnetic transitions exhibit thermal hysteresis. It is shown that the Kitell model is a special case of the Landau expansion. Finally, an alternative one-component order parameter expansion is discussed. (6 refs.)

102671 Resonance modes in a Dzyaloshinsky-Moriya spin-glass. C.G.Morgan-Pond (Dept. of Phys., New York Univ., New York, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.490-3 (8 Aug. 1983).
Simulations of Ruderman-Kittel-Kasuya-Yosida spin-glasses with Dzyaloshinsky-Moriya anisotropy show three resonance modes which are well described by the triad model. The behavior of the modes and the breakdown of this picture for large anisotropy are studied. A quantitative study is made of the relationship between the microscopic Dzyaloshinsky-Moriya pair anisotropy, H_{DM}, and the macroscopic anisotropy parameter, K, including the effects of relaxation. It is found that the estimate of K from microscopic parameters is still too high, even when corrected for relaxation. (8 refs.)

102672 Effect of high magnetic fields on the heat capacity of strongly Pauli-paramagnetic Pd-Ni alloys. K.Ikeda, K.A.Gschneidner,Jr. (Dept. of Materials Sci. & Engng., Iowa State Univ., Ames, IA, USA), A.I.Schindler.
Phys. Rev. B (USA), vol.28, no.3, p.1457-65 (1 Aug. 1983).
The low-temperature [(1.3-20.0)-K] heat capacity of strongly Pauli-paramagnetic Pd-Ni alloys containing 0.47 and 0.97 at.% Ni was measured in magnetic fields up to 10 T. The electronic specific-heat constant becomes smaller with increasing fields (12% or 13% at 9.98 T). This is probably due to the depression of the spin-fluctuation enhancement of heat capacity by the high magnetic fields and is in accord with the recent theoretical predictions. The coefficient β of the T^3 term in the heat capacity becomes larger with increasing fields and at $H \gtrsim 5.39$ T it reaches almost the same value as that for alloys containing more than ~5 at.% Ni. Two possible mechanisms have been proposed to account for the increase in β. (1) The increase is due to the magnetic quenching of localized spin fluctuations in the vicinity of the nickel atoms, or (2) the increase is due to a magnetic contribution to the heat capacity which results from an induced magnetic moment on the nickel atoms by the applied magnetic field. Additional experiments are needed to determine which mechanism is the correct one. (39 refs.)

102673 Magnetic behavior of Fe_xSn_{1-x} amorphous alloys near the critical composition. M.Piecuch (Lab. de Phys. du Solide, Univ. de Nancy I, Vandoeuvre-les-Nancy, France), Chr.Janot, G.Marchal, M.Vergnat.
Phys. Rev. B (USA), vol.28, no.3, p.1480-9 (1 Aug. 1983).
Amorphous alloys of the tin-iron system have been prepared by the vapor-quenching technique. Bulk magnetic data show typical 'spin-glass-like' behavior in the low-temperature susceptibility and in the remanent magnetization for alloys containing less than about 40 at.% of iron. A multicritical magnetic phase diagram with paramagnetic, and spin-glass-like phases is proposed. High-field magnetization measured up to 150 kOe strongly suggests that local anisotropy, randomly oriented through the material, might successfully compete with exchange interactions for some of the iron clusters. (36 refs.)

102674 High-field specific heat of the spin-fluctuations system UAl_2. G.R.Stewart, A.L.Giorgi (Materials Sci. & Technol. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), B.L.Brandt, S.Foner, A.J.Arko.
Phys. Rev. B (USA), vol.28, no.3, p.1524-8 (1 Aug. 1983).
Measurements of the low-temperature specific heat, both in 0 and 7-T applied field, and magnetic susceptibility on polycrystalline, unannealed single-crystal and annealed single-crystal samples of UAl_2 show no sample dependence for these properties to ±5%, in contrast to recent results for $TiBe_2$. Measurements of the specific heat of the annealed single crystal of UAl_2 from 2 to 23K in fields to 12.5T and from 4 to 16K in fields to 17 T indicate a partial (~40%) suppression of the spin-fluctuation contribution, which occurs at 2K in 12.5 T, and the possible existence of a small competing effect which increases the specific heat with increasing field above 4K. These results are compared with recent magnetization and magnetoresistivity results which indicate suppression of spin fluctuations in UAl_2 between 15 and 20. (26 refs.)

102675 Limitations of spin-wave theory in $T=0$ spin dynamics. J.H.Taylor (Dept. of Phys., Univ. of Rhode Island, Kingston, RI, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1529-33 (1 Aug. 1983).
The $T=0$ dynamics of a family of one-dimensional quantum spin systems with fully order (ferromagnetic or spin-flop) ground states is investigated. By rigorous calculations, it is demonstrated that the $T=0$ dynamic structure factor is, in general, not a δ function as predicted by linear spin-wave theory but characterized by more complicated structures with nonzero linewidths. The exact result approaches the spin-wave result in the classical limit $s \rightarrow \infty$. The results of this study demonstrate how quantum effects may invalidate spin-wave theory even in the presence of saturated magnetic long-range order. Hence the failure of spin-wave theory is not necessarily linked to the absence or strong reduction of long-range order typical for one-dimensional quantum spin systems. The unreliability of spin-wave theory has therefore to be suspected also for the dynamics of three-dimensional quantum spin systems where the long-range order is always strong at $T=0$. (20 refs.)

102676 Quantum-mechanical ground state of crystals with dipole-dipole and exchange interactions. S.Thanos, A.K.Theophilou (Nuclear Res. Center 'Demokritos,' Aghia Paraskevi, Attikis, Greece).
Phys. Rev. B (USA), vol.28, no.3, p.1534-43 (1 Aug. 1983).
This paper deals with the quantum-mechanical ground state of crystals with dipole-dipole and exchange interactions. The approximation used is that the wave function is a product of the eight-spin wave functions of the magnetic ion supercells. The wave functions of the supercells are assumed to have the same form. Thus spin correlations for magnetic ions in the same supercell are taken into account, whereas in common mean-field theory this effect is neglected. Correlations between ions in different supercells are not taken into account. The eight-spin wave functions are constructed by using the theory of irreducible representations of the translation group. An additional simplification results by taking advantage of the classical solution of the problem. The method developed here is applied for a determination of the ground state of cerous magnesium nitrate, the results of which appear in the following paper. (17 refs.)

102677 Quantum-mechanical ground state of cerous magnesium nitrate. S.Thanos, A.K.Theophilou (Nuclear Res. Center 'Demokritos,' Aghia Paraskevi, Attikis, Greece).
Phys. Rev. B (USA), vol.28, no.3, p.1544-7 (1 Aug. 1983).
This paper deals with the quantum-mechanical ground state of cerous magnesium nitrate (CMN). The approximation used is that of Luttinger and Tisza and of Niemeijer, in which spin correlations for magnetic ions in the same supercell are taken into account, while those between ions in different supercells are neglected. The method used is that presented in an earlier paper of the present authors. It is found that the quantum-mechanical ground state of CMN is a linear combination of the state with spin orientations those of the classical state found by Niemeijer plus the complementary state. Thus the classical state is a good approximation for quick results. This state has nearly the same energy as the three mutually degenerate states belonging to the k_1, k_2, k_3 representations of the translation group. These are formed by linear combinations of states with four spins up and four spins down as is the case with the ground state. The results found fit well with the existing experimental information about CMN. (15 refs.)

102678 ϵ-expansion calculations for spin-glasses. M.Chang (Serin Phys. Lab., Rutgers Univ., Piscataway, NJ, USA).
Solid State Commun. (USA), vol.47, no.7, p.529-31 (Aug. 1983).
The critical properties of the spin-glass transition proposed by Edwards and Anderson (1975) are studied using the minimal subtraction method. The universal ratio of the second correction to scaling amplitude to the square of the first for the order parameter susceptibility χ_0 is calculated to first order in $\epsilon(\epsilon=6\text{-d})$. Comparison is made with Fisch and Harris' (1977) high temperature series analysis which incorporated Rudnick-Nelson-type corrections to scaling. Within the same formalism the critical exponents are calculated to second order in ϵ. They agree with the first order ϵ expansion of Harris et al. (1976). (14 refs.)

75.40D Ising and other classical spin models

102679 The Ising spin glass in a magnetic field. D.Elderfield (Blackett Lab., Imperial Coll., London, England).
J. Phys. A (GB), vol.16, no.12, p.L439-46 (21 Aug. 1983).
The profile of the field-cooled magnetisation is considered in the vicinity of the spin-glass transition for the Parisi (1978, 1980, 1983) solution. In a finite field the flat profile of Parisi and Toulouse (1980) is modified and one observes a weak cusp. Analytic expansions are obtained both for the high-field (low-temperature) and low-field (high-temperature) regimes. (15 refs.)

102680 Order parameter susceptibility in the Parisi solution for spin glasses. A.Khurana (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany).
J. Phys. A (GB), vol.16, no.12, p.2843-52 (21 Aug. 1983).
An exact expression is obtained for the order parameter susceptibility, χ_R, in the Parisi solution for spin glasses, which shows that the vanishing of the order parameter function, $q(x)$, at the origin, a constant spin susceptibility and the divergence of χ_R in the spin-glass phase are all intrinsically related. This expression for χ_R also suggests that the squared-averaged magnetisation is given by $q(0)$ and not $q(1)$. (16 refs.)

102681 On the location of the critical point of the *q*-state Potts models on the decorated hypercubic lattice. D.Hajdukovic (Dept. of Phys. & Meteorology, Faculty of Natural & Math. Sci., Belgrade, Yugoslavia).
J. Phys. A (GB), vol.16, no.12, p.2881-2 (21 Aug. 1983).
Recently a critical condition for the *q*-state Potts ferromagnet on the hypercubic lattice was obtained. The author extends this result to both ferromagnetic and antiferromagnetic Potts models on the bond-decorated hypercubic lattice. (6 refs.)

102682 Phase diagrams for anisotropic spin glasses. A.J.Bray, L.Viana (Dept. of Theoretical Phys., Univ. of Manchester, Manchester, England).
J. Phys. C (GB), vol.16, no.23, p.4679-92 (20 Aug. 1983).
Phase diagrams are derived, at the mean-field level, for spin glasses with uniaxial anisotropy. Exchange anisotropy and single-ion anisotropy are considered separately. The critical anisotropies at zero temperature are expressed in terms of the internal field distributions for Ising and planar systems, avoiding the replica method. The phase diagrams are qualitatively similar for the two models except that for 'easy-axis' exchange anisotropy two consecutive transitions are predicted as a function of temperature for all values of the anisotropy, whereas for single-ion anisotropy two transitions are predicted only when the anisotropy is sufficiently weak. (17 refs.)

102683 Mixed phase for the infinite-range Potts spin glass. E.J.S.Lage, A.Erzan (Lab. de Fisica, Faculdade de Ciencias, Porto, Portugal).
J. Phys. C (GB), vol.16, no.24, p.L873-6 (30 Aug. 1983).
The stability conditions for the paramagnetic (PM) phase of the infinite-ranged random Potts model are re-examined. A new replica symmetric ansatz with Potts symmetry breaking yields a phase diagram where the line of Curie temperatures for the onset of a mixed ordered phase matches the stability conditions for the PM phase. Extrema conditions for the free energy indicate that Potts symmetry breaking may not exist for $2<s<4$, where the transition is second order, while it is necessary for $s>4$, where the transition is first order. (3 refs.)

102684 Linear response theory and the one-dimensional Ising ferromagnet in a random field. G.Aeppli (Bell Labs., Murray Hill, NJ, USA), R.Bruinsma.
Phys. Lett. A (Netherlands), vol.97A, no.3, p.117-20 (15 Aug. 1983).
Linear response theory applied to the one-dimensional Ising model in a discrete random field shows that for temperatures above a critical value, the integrated local magnetization distribution function is a devil's staircase. For lower temperatures, there is an infinite series of transitions, at each of which this function is explicitly calculable. (5 refs.)

102685 Random-field effects in the diluted two-dimensional Ising antiferromagnet $Rb_2Co_{0.7}Mg_{0.3}F_4$. R.J.Birgeneau (Dept. of Phys., MIT, MA, USA), H.Yoshizawa, R.A.Cowley, G.Shirane, H.Ikeda.
Phys. Rev. B (USA), vol.28, no.3, p.1438-48 (1 Aug. 1983).
The authors report a comprehensive neutron scattering study of the spin correlations in the diluted two-dimensional (2D) Ising antiferromagnet $Rb_2Co_{0.7}Mg_{0.3}F_4$ in an applied magnetic field. As predicted by Fishman and Aharony (1979), an applied field in this system produces a random staggered magnetic field. Random fields are expected to have drastic effects on the cooperative behavior of magnets although the detailed behavior remains controversial. It is found that the applied magnetic field, and by inference the concomitant random staggered fields, destroy the 2D long-range order for all temperatures and fields. The structure factor $\mathscr{S}^{zz}(\vec{Q})=\Sigma_{\vec{r}}e^{i\vec{q}\cdot\vec{r}}\langle S^z_{\vec{r}}\cdot S^z_{\vec{0}}\rangle_T$ is well described as the sum of a Lorentzian plus a Lorentzian squared with the Lorentzian-squared term dominating at low temperatures. The integrated intensity of the Lorentzian-squared term exhibits the same temperature dependence as the Bragg intensity at zero field. The correlation length κ and structure-factor peak intensity $\mathscr{S}^{zz}(\vec{Q}_0)$ exhibit power-law dependences on the applied field H, $\kappa\sim H^{1.6}$, and $\mathscr{S}^{zz}(\vec{Q}_0)\sim H^{-3.2}$ at low temperatures; the measured exponents agree reasonably with the values 2 and -4, respectively, deduced from theories with the lower marginal dimensionality $d_l=3$. The effective exponents initially increase slightly with increasing temperature and then decrease dramatically as $T\rightarrow T_N$, taking on values of about 0.7 and -1.2, respectively, at $T_N=42.5K$. For small but nonzero applied fields the inverse correlation length may be factorized into a random-field part and a thermal part, $\kappa=\kappa_{RF}+\kappa_T$, with $\kappa_T\sim e^{-3.4J(zz)/k(B)T}$ where J^{zz} is the Ising exchange constant. It is also found that for $T<20K$ reproducible results are only obtained when the sample is cooled in the presence of the applied field; this history-dependent behavior is analogous to that found in spin-glasses. (21 refs.)

102686 Domain walls and shape dependence of finite-size correction terms in the two-dimensional Ising-model critical region. P.Kleban, G.Akinci (Dept. of Phys. & Astron., Univ. of Maine, Orono, ME, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1466-74 (1 Aug. 1983).
Ferdinand and Fisher (1969) have analyzed the finite-size behavior of the two-dimensional Ising model with periodic boundary conditions for T near T_c. In the thermodynamic limit the leading correction term to the specific heat has an unusual and unexpected behavior as the shape of the $m\times n$ lattice is changed. For shape parameter $s=m/n=1$, the peak in the specific-heat correction term occurs at a reduced temperature $\tau_{max}=2K_cn(T-T_c)/T_c>0$. With increasing s the peak moves to negative τ values and then increases to 0. The authors show that this effect may be understood by keeping only the two largest eigenvalues of the transfer matrix. To this approximation, which is good for $s=1$ and improves exponentially with increasing s, all the shape dependence of the free energy is due to a factor that can be expressed entirely in terms of a domain-wall energy. Furthermore, the functional form of this factor is the same as that of the finite-length correction to the one-dimensional Ising model. Thus the dependence of τ_{max} on s is qualitatively similar to the dependence of $T_{max}^{\ 1}$, the location of the one-dimensional Ising-model specific-heat peak on N, the number of spins. They also argue that the two-dimensional partition function is expressible at least for $s>1$ as a factor due to domains, and another due to a one-dimensional Ising array of domain walls. Approximate expressions are obtained for the effective number of spins and the effective coupling of the array. They also point out that there is reason to believe the one-dimensional Ising array domain walls at fixed τ connects smoothly with a similar array for $T<T_c$. (13 refs.)

102687 Irreversibility and metastability in spin-glasses. I. Ising model. C.M.Soukoulis (Corporate Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA), K.Levin, G.S.Grest.
Phys. Rev. B (USA), vol.28, no.3, p.1495-509 (1 Aug. 1983).
By studying the evolution (with field H and temperature T) of the free-energy surface the authors numerically calculate various history-dependent magnetizations. The interactions are assumed to be of short range with a Gaussian probability distribution. In this paper, only Ising spin-glasses are discussed. In a companion paper, they treat vector spins. Only the simplest mean-field (MF) approximation to the free-energy functional $F[\ m_i\ ]$ (where m_i is the thermally averaged spin at the *i*th site) is studied. For finite-size systems, it is difficult to include the reaction corrections to F within a self-consistent formalism. Good qualitative agreement with experiment is found for the T and H dependence of the field-cooled and zero-field-cooled, and thermal and isothermal remanent magnetizations. The hysteresis loops are qualitatively similar to those observed in *Au*Fe spin-glasses. The characteristic changes in the shape of the loop as the Fe concentration increases can also be reproduced theoretically. At $T=0$, the corrections to MF theory are negligible and it is shown that the ground states generated iteratively by cooling solutions of the MF equations are obtained much more rapidly and are of lower energy than those found in Monte Carlo simulations. It is demonstrated that the field-cooled state, which is obtained by a series of reversible procedures, is one for which linear-response theory (properly interpreted) and Maxwell's relations all hold. The close correspondence between their theory and experiment supports the hypothesis that on intermediate-time scales the behavior of spin-glasses is primarily determined by the properties of the free-energy surface: Irreversibility occurs when minima of F are destroyed with changing H or T. 102688 Quantum critical behaviour of X-Y spin model with magnetic field. T.K.Kopec (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.123-34 (July 1983).
The Wilson renormalization group (RG) approach to critical phenomena is used when a phase transition is induced by an external parameter, i.e. a longitudinal magnetic field in spin X-Y quantum model. The generalization of the effective Ginzburg-Landau functional is also obtained from the Hamiltonian of the system in a form containing a complex order parameter. The RG equations and their fixed points are obtained and investigated in two cases: finite and zero temperature. It is explicitly shown that the model at finite temperature behaves like the standard classical two-component one while at zero temperature its behaviour is described by critical exponents which are unchanged to the first order in $\varepsilon=2-d$, i.e. have still Gaussian values although the nontrivial no-classical fixed point is found. The calculations of the anomalous part of the dimension$-\eta$ and dynamical critical exponent z performed to the second order in ε also showed that they remain unchanged to this order. (15 refs.)

102689 Scaling stiffness of spin glasses. J.R.Banavar (Bell Labs., Murray Hill, NJ, USA), M.Cieplak.
J. Phys. C (GB), vol.16, no.21, p.L755-9 (30 July 1983).
The concept of a scaling stiffness for frustrated systems is introduced. Physical arguments supported by numerical calculations on a 3d Heisenberg spin glass suggest that its apparent lower critical dimensionality is time dependent, being equal to three on short time scales and bigger than three at sufficiently long times. (18 refs.)

102690 Non-linear modes and statistical mechanics of a classical Heisenberg chain with two anisotropies. C.Etrich, H.J.Mikeska (Inst. fur Theoretische Phys., Univ. Hannover, Hannover, Germany).
J. Phys. C (GB), vol.16, no.24, p.4889-900 (30 Aug. 1983).
The authors investigate the relevance of soliton modes for the statistical mechanics of a classical Heisenberg chain with two single-ion anisotropies—a model that has two continuous degrees of freedom and allows one to treat exactly the crossover between broken Heisenberg and planar symmetries. Starting from exact soliton solutions as given by Sklyanin the authors discuss the two branches of the soliton spectrum, small vibrations in the presence of solitons and the stability of solitons. They show that the statistical mechanics of this chain as obtained from the transfer integral method is reproduced exactly by the phenomenological approach using solitons and phonons. The relevance of the model for the properties of the easy-plane antiferromagnetic chain in an external magnetic field is discussed. (18 refs.)

102691 Topological model of a Heisenberg spin glass. I.E.Dzyaloshinskii (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.4, p.227-9 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.190-2 (20 Feb. 1983).
Two aspects of a model recently proposed for a Heisenberg spin glass are discussed: the asymptotic freedom of the theory and the absence of a long-range order with a correlation radius which vanishes exponentially with the temperature. The latter circumstance means that $d=3$ is the lower critical dimensionality of the model. (13 refs.)

102692 Irreversibility and metastability in spin glasses. II Heisenberg model. C.M.Soukoulis, G.S.Grest (Corporate Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1510-23 (1 Aug. 1983).
For pt.I see ibid., vol.28, p.1495 (1983). The authors numerically compute the various history-dependent magnetizations for Heisenberg spin-glasses with and without anisotropy. The exchange interactions are of short range and have a Gaussian probability distribution. The approach closely follows that of paper I. In the absence of anisotropy, a Heisenberg spin-glass is found to have no irreversibility. The field-cooled and zero-field-cooled magnetizations are macroscopically equivalent and magnetic hysteresis is absent. This macroscopic reversibility is a consequence of the accessibility of the rotationally degenerate field-cooled state and does not correspond to microscopic reversibility. Both Dzyaloshinsky-Moriya (DM) and uniaxial anisotropy introduce macroscopic irreversibility. In the latter case the hysteresis loops are like those found for Ising spins. In the former case, in some situations, they find displaced loops, which look similar to those seen in Mn-containing spin-glasses. To get qualitative agreement with experiment, they must also impose a tendency towards ferromagnetism. This ferromagnetic tendency (which corresponds to a displace Gaussian exchange distribution with $J_0>0$) is essential in order to maintain rigid rotation of the spins in response to field rotations. This rigidity is a fundamental assumption in other approaches which explain analytically why DM anisotropy leads to displace hysteresis loops. Finally they study the coexistent (longitudinal) ferromagnetic-(transverse) spin-glass phase proposed by Gabay and Toulouse (1981). The behavior of the coexistent spin-glass is very similar to that of typical spin-glasses in very large applied fields. They see no indication for reentrant behavior, as is often observed experimentally, in the temperature-dependent moderate field magnetizations. Furthermore, a calculation of the zero-field (J_0,T) phase diagram for isotropic systems shows no evidence for reentrant behavior. They cannot rule out the possibility that a reentrant transition exists only in some narrow range of low magnetic fields. (37 refs.)

75.60C Domain walls and domain structure

(for magnetic bubbles, see 75.70K)

102693 Neutron depolarisation in zigzag folded 90° walls in silicon iron. W.H.Kraan, J.J.VanLoef, M.Th.Rekveldt (Interuniv. Reactor Inst., Delft, Netherlands), V.Ungemach.
J. Phys. C (GB), vol.16, no.24, p.4901-16 (30 Aug. 1983).
A polarised monochromatic ($\lambda=0.16$ and 0.41 nm) neutron beam is transmitted at various glancing angles $\theta(0\leq|\theta|\leq10°)$ through 90° walls in a Fe (5% Si) single crystal of dimensions $40\times3.2\times1.9$ mm^3 with its bar axis parallel to [110]. From a three-dimensional polarisation analysis after transmission it appears that the effect of the 90° wall on the neutron polarisation vector is present up to at least $|\theta|=10°$. From these observations the authors conclude that the 90° wall is not a plane Bloch wall, but rather a wall region with a thickness of at least 10 μm. This is consistent with the zigzag folding of such walls. Furthermore the technique used enables one to distinguish the mean effects of neighbouring 90° walls. In a transmission experiment over the 'upper' half of the sample they have observed that the effect of neighbouring walls on the polarisation vector is antisymmetric in θ. This result supports the suggestion by Ungemach (1977) that the amplitude of the zigzag folding varies with the height being in antiphase in neighbouring 90° walls. (21 refs.)

102694 Light-induced dynamic instability of the domain structure in $FeBO_3$:Ni. Yu.M.Fedorov, A.A.Leksikov, A.E.Aksenov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
JETP Lett. (USA), vol.37, no.3, p.161-4 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.134-6 (5 Feb. 1983).
Light-induced instability is observed in the domain structure of the crystal $FeBO_3$:Ni, observed in polarised light, in the form of propagating wave excitations in the spin system, whose parameters depend on the intensity and wavelength of the light, external magnetic field, and temperature. (4 refs.)

JETP Lett. (USA), vol.37, no.5, p.264-7 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.223-6 (5 March 1983).
It is shown that in the interval from the longitudinal sound velocity to the spin wave velocity, the stationary motion of a domain wall in yttrium orthoferrite occurs with a discrete set of velocities corresponding to the phase velocities of Lamb waves in the plate. The width of the constant-velocity intervals increases with decreasing specimen thickness. (12 refs.)

102696 Temperature and magnetic field dependence of magnetization and magnetoresistance in amorphous Fe-Ni based alloys. A.Handstein, J.Schneider (Central Inst. of Solid State Phys. & Materials Res., Acad. of Sci., Dresden, Germany), J.Kadlecova.
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.371-82 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The behaviour of magnetization M and magnetoresistance $\Delta\rho^H/\rho^0$ of amorphous $(Fe_xNi_{1-x})_{80}P_{10}B_{10}$ alloys is reviewed at low temperatures and high magnetic fields. The behaviour of $M(T,H,x)$ characterizes these alloys over a large concentration range as inhomogeneous and/or heterogeneous magnetic materials. The magnetoresistance data support this picture. (31 refs.)

102697 The influence of ageing on changes in coercivity and in the mechanism of decohesion of CuNiFe permanent magnet alloy. S.Szymura (Inst. of Phys., Tech. Univ. Czestochowa, Czestochowa, Poland).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.407-12 (Aug. 1983).
Magnetic hardness of the CuNiFe alloy increased from about 300 sec with isothermal ageing time. The absolute value of the maximum coercive force apparently increased as the temperature of the transformation decreased. The isothermal ageing of the CuNiFe alloy is followed by changes in the mechanism of decohesion from a ductile transcrystalline fracture—typical for a quenched state—to a brittle intercrystalline fracture, which is typical for an alloy of maximal coercive force. The changes in the morphology of fractures contributed to a marked increase in tensile strength and a reduction in the striction. (5 refs.)

102698 Distribution of the magnetization in amorphous wire-shaped samples. E.E.Chepurova, A.V.Shtain (M.V. Lomonosov State Univ., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1088-91 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A magnetooptic micromagnetometer was used to study the characteristics of the distribution of the magnetization and the processes of magnetization reversal in an amorphous microwire of the $Fe_{80}B_{10}P_{10}$ composition. The results indicated formation of a domain structure with a magnetization ripple due to the dispersion of the magnetic anisotropy on the microscopic and macroscopic scales. Magnetization switching in a field applied along the wire axis involved noncoherent rotation of the magnetization. In fields exceeding considerably the coercive force the magnetization switching processes were hindered. This was indicated by retention of the transverse components in the fields such that the magnetization component parallel to the wire axis was practically unaffected. (10 refs.) *A.T.*

102699 Relaxation processes and temperature-time stability of the initial permeability of amorphous alloy $Fe_5Co_{70}Si_{15}B_{10}$. I.B.Kekalo, V.L.Stolyarov, V.Yu.Tsvetkov (Inst. of Steel & Alloys, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1117-24 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The temperature and time dependences of the initial permeability μ_a were determined for the amorphous alloy $Fe_5Co_{70}Si_{15}B_{10}$ in the initial state and after high-temperature annealing. The characteristic features of the temperature dependence of μ_a were determined mainly by the stabilization of domain walls because of directional composition ordering. Annealed samples exhibited a characteristic thermal reversibility of the processes: the initial value of μ_a was restored by repeating the heat treatment. A magnetic reversibility (recovery of μ_a as a result of demagnetization in an alternating field) was observed only after heating to 60°C. The nature of the processes responsible for this behaviour was analysed. (18 refs.) *A.T.*

102700 Mathematical model of magnetisation of a ferromagnetic in a one-dimensional field. N.A.Zolotarev.
Izv. VUZ Elektromekh. (USSR), no.5, p.5-14 (May 1983). In Russian.
The properties of a perfect magnetisation curve are examined with the aid of a mathematical model for magnetic hysteresis. The model is set up on the assumption of an unambiguous development of the magnetisation process in the ferromagnetic, starting from a fixed initial state, for given changes of the magnetic field intensity with time. A method for investigating theoretically damped magnetic oscillations is explained. (4 refs.) *Z.F.V.*

102701 Magnetic losses in metallic glasses under pulsed excitation. C.H.Smith (Metglas Products, Parsippany, NJ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2918-20 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Magnetic losses in ferromagnetic metallic glasses are discussed with respect to their use in particle accelerators. Domain models for magnetization under fast pulse conditions are discussed and compared to experimental measurements. (20 refs.)

102702 New developments in high-magnetic permeability permalloys. T.M.Panakhov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.100-4 (1982). In Russian.
The possibility of creating high-magnetic permeability permalloys by doping with Nb4÷10 and Ta 10÷16 at.% was studied. The alloys with maximum magnetic permeability of more than 10^5 and up to 6×10^5 were obtained for optimal composition and heat treatment conditions. (3 refs.)

102703 On the mechanism of generation of magnetization jumps in polycrystalline ferrites. G.Zh.Rankis, V.B.Nikitin, L.N.Averbukh.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.24-8 (1983). In Russian.
The relation between the amplitude distribution of pulses, induced in the search coil from magnetization jumps in nickel ferrite, and the distribution of grain sizes is discussed. The shapes of observed pulses are described. One may conclude that many of the observed pulses may be the consequence of a collective phenomenon—bounded jumps, which arise when domain walls are moving in some group of adjacent grains. (6 refs.)

102704 Barkhausen effect in polycrystalline ferrites with various values of initial permeability. G.Zh.Rankis, V.B.Nikitin.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.29-34 (1983). In Russian.
This work is devoted to the explanation of two experimentally found relations in polycrystalline ferrites: the small number of jumps in comparison with the number of grains in the sample of nickel ferrite and the decrease of the amplitudes of pulses with the increase of the initial permeability of the ferrite. These relations are shown to serve as the evidence of the mechanism of hysteresis, determined by the friction of domain wall. (6 refs.)

102705 Magnetization of the rare-earth sublattice in intermetallic compounds of the type $R(Co_{1-x}Ni_x)_5$. V.V.Kelarev, V.V.Chuev, A.N.Pirogov, S.K.Sidorov, V.N.Dvinyaninov.
Phys. Status Solidi b (Germany), vol.118, no.1, p.K75-8 (1 July 1983).
The magnetisation of the rare earthed sublattice in $R(Co_{1-x}Ni_x)_5$ type alloys is considered. Using the expression for the magnetisation of Ermolenko et al. (1975) and neutron difraction data the authors estimate I_{R-Co}^O, the energy of the exchange coupling between the R atoms and the Co sublattice, and K_R^O, the second-order microscopic anisotropy constant per R ion. (4 refs.)

102706 Improving the magnetic properties of electrical steels and magnetic cores by thermomagnetic treatment. M.K.Savchenko, V.I.Efimov, V.I.Sen'kin.
Sov. Electr. Eng. (USA), vol.53, no.3, p.93-6 (1982). Translation of: *Elektrotekhnika (USSR)*, vol.53, no.3, p.50-2 (1982).
An investigation has been made of the influence of thermomagnetic treatment conditions on the magnetization curves and magnetic reversal losses in electrical steels with a silicon content form 0 to 4%. It is shown that in the case of

all unannealed steels, thermomagnetic treatment carried out in an alternating field is most effective from temperatures close to the Curie point. In the case of annealed alloy steels an increase in the thermomagnetic treatment temperature above 400°C does not alter the magnetic properties. In annealed unalloyed steels the effects of thermomagnetic treatment are not apparent. (6 refs.)

75.60G High coercivity materials

102707 Spinodal decomposition and magnetic properties of Fe-Cr-12Co permanent magnet alloys. Tsung-Shune Chin, Tien-Shou Wu, C.Y.Chang (Res. Inst. of Electronics & Electrical Engng., Cheng Kung Univ., Tainan, Taiwan).
J. Appl. Phys. (USA), vol.54, no.8, p.4502-11 (Aug. 1983).
This report is concerned with the spinodal decomposition and magnetic properties of Fe-21∼30 Cr-12Co ternary alloys (by weight) as studied by transmission electron microscopy and magnetic measurements. Wavelength growth of the isothermally aged spinodal structure is found to be proportional to time$^{1/3}$ for the later stage of aging at all aging temperatures, which suggests a coarsening process. Spinodal temperatures of those alloys are found to be higher than each of their properties. Hence, a prerequisite of a higher Curie temperature in the magnetic aging theory is concluded to be unnecessary. Moreover, as the extrapolated onset spinodal wavelength, of 80-100 Å, is superparamagnetic in nature, this suggests a prerequisite for the magnetic aging theory. Before magnetic aging can be operative, the particle should grow to a certain critical size, determined by the aging temperature and the anisotropy energy at that temperature, in order to have thermally stable magnetization. (25 refs.)

102708 The new curve for the non-linear magnet. H.Hoft (Sektion Phys., Tech. Hochschule, Karl-Marx-Stadt, Germany).
Z. Elektr. Inf.- & Energietech. (Germany), vol.13, no.3, p.251-8 (1983). In German.
Discusses a simple model which describes non-linear magnetism phenomenologically instead of using the previous analytical methods. This facilitates the calculation of the interactions between the characteristics of the magnet and provides new insights on its internal structure. The model treats the macrodomains of the magnet as crystallite structures in a polycrystalline solid body. After discussing reversible and irreversible magnetisation processes the author formulates this new hysteresis curve and indicates the information that can be derived from it. (16 refs.) *G.W.*

102709 Electron-microscopic investigation of the magnetic state of planar single-layer systems of small Fe and Fe-Co particles. B.V.Vasil'ev, A.A.Potseluiko, V.G.Pyn'ko (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1218-19 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Particles of pure iron and of an iron-cobalt alloy (composition not given) were of 400-2000 Å size and were separated by short distances from one another. The particles were disk-shaped and separated by lithium fluoride. The thickness of these systems was 300-500 Å thick in the vertical direction. When the distances separating the particles were less than their size, single-domain and single-vortex magnetic states of the systems were observed in the absence of an external field. 75.60L Magnetic aftereffects

102710 Hydrogen in Fe$_{40}$Ni$_{40}$P$_{14}$B$_6$ amorphous alloys studied by magnetic aftereffect, internal friction, and positron annihilation. C.M.Mo (Inst. of Solid State Phys., Acad. Sinica, Hefei, China), P.Moser.
Phys. Status Solidi a (Germany), vol.78, no.1, p.201-10 (16 July 1983).
The effect of hydrogen or/and deformation on internal friction, magnetic aftereffect, and positron lifetime in amorphous Fe$_{40}$Ni$_{40}$P$_{14}$B$_6$ alloy is investigated over a temperatue range from 4 to 400K. In both hydrogen charged cold-worked and additively hydrogen charged specimens, an internal friction peak is found at 205K, and a corresponding magnetic aftereffect peak at 163K. Both peaks shift to higher temperature after aging at 340K. The strength of the magnetic relaxation depends on the amplitude of the cold work. (22 refs.)

102711 Richter type magnetic after-effect in YIG at helium temperature. M.Wurlitzer (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K87-91 (16 July 1983).
The author has investigated the complex permeability of polycrystalline YIG samples with additions of Si, Ti, Zr, or Ca in a weak alternating field. Under these conditions magnetic after effect (MA) can be detected if the average relaxation time reaches the period of the alternating magnetic field and causes a dispersion of permeability μ' connected with the appearance of magnetic losses. It can be seen that besides the already known ranges (I, II) below room temperature, at liquid helium temperature, a further MA range (III) exists where the relaxation time is in the order of 10^{-5} s. (15 refs.)

75.70 MAGNETIC FILMS AND PLATES

102712 Structure of domain tips in thin ferromagnetic films. A.V.Gavrilyuk, V.P.Karabanova, V.P.Panaetov, V.I.Popov, V.N.Popov (Pedagogical Inst., Irkutsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1221-3 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the structure of the tips of planar magnetic domains. The study was carried out by electron-microscopic powder methods on films with the composition 20% Fe-80% Ni. It was found that the nature of the tips depended on the film thickness and on the direction of the easy or difficult magnetization axis. (5 refs.) *A.T.*

102713 Preparation of Co-Cr thin films by DC sputtering technique. T.Takahashi, J.Yoshida (Faculty of Engng., Toyama Univ., Takaoka, Japan).
J. Vac. Soc. Jpn. (Japan), vol.26, no.6, p.571-6 (1983). In Japanese.
Co-Cr films were deposited by DC sputtering on pyrex glass and polyimide film. The crystal structure, the composition ratio and the M-H hysteresis loop of the films were investigated by X-ray diffractometer (XD), Auger electron spectroscopy (AES) and vibrating sample magnetometer (VSM), respectively. The *c*-axis of Co-Cr sputtered film is oriented perpendicular to the film plane. The angle of half-width of the rocking curve in (002) plane ranges from 10° to 13°. The Co/Cr atomic ratio (at.%) in the films is 6.7. The existence of oxygen is observed in excess at a thin layer (∼50 Å) near the film surface. When a perpendicular magnetic field is applied to the film plane, the M-H hysteresis loop (M-H$_\perp$) shows a rectangular loop and a squareness ratio from 0.8 to 0.9 is obtained. Saturation magnetization and coercive force in M-H$_\perp$ are from 580 to 650 emu/cc and from 400 to 600 Oe respectively. (9 refs.)

102714 Structured films of magnetizable surface-active substances. N.G.Taktarov.
Magnetohydrodynamics (USA), vol.18, no.4, p.351-5 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.28-32 (Oct.-Dec. 1982).
Films of a magnetic surfactant were produced by depositing on the surface of water a small amount of ferrofluid on kerosene base with a saturation magnetization M_m=100 G=100 kA/m. Visual observation of such films reveals that films of magnetic surfactants can essentially also be subdivided into gaseous, liquid, and solid ones. Films of all three types are transparent. Gaseous and liquid films are mobile and respond easily to a nonuniform magnetic field of a small permanent magnet. When a sufficient amount of ferrofluid has been deposited on the surface of water, a dense solid film will form. The mechanical properties of solid films of magnetic surfactants can be described with the aid of a two-dimensional strain tensor and two dimensional equations of elasticity. The author studies the surface magnetisation of these solid films. (8 refs.)

75.70K Domain structure (magnetic bubbles)

102715 The movement of magnetic bubbles in a rotating field gradient. D.J.Breed, P.Q.J.Nederpel (Philips Res. Labs., Eindhoven, Netherlands).
J. Appl. Phys. (USA), vol.54, no.7, p.4054-8 (July 1983).
Magnetic bubbles can move in steady state under the influence of rotating field gradients. In the experiments reported in this paper the rotating field gradient method, as described by Jones et al. (1979), was used. Some technical improvements were introduced and two garnet films with uniaxial anisotropy were studied. The observed bubble mobilities compare very well with the mobilities obtained by the conventional bubble translation technique. The present method appears to be very suitable for studying the dynamic behavior of the magnetic bubbles near critical drive fields. (5 refs.)

102716 Analytical solutions of bubble tracks in periodical propagation structures. J.J.M.Ruigrok (Dept. of Electrical Engng., Univ. of Technol., Delft, Netherlands).
J. Appl. Phys. (USA), vol.54, no.7, p.4059-70 (July 1983).
In this paper a general expression is derived that describes tracks of bubbles in current-access devices, the rotating gradient experiment, etc. A resonance phenomenon resulting from this equation is experimentally verified: The periodical motion of a hard bubble shows a sharp maximum at a certain frequency of operation. This resonance frequency is proportional to the steepness of the magnetic potential well in which the bubble is captured and inversely proportional to the gyrotropic constant of the bubble. Even unichiral bubbles in low damping material may show this phenomenon. From this resonance frequency the gyrotropic constant of the bubble can be accurately determined. The experimental technique of applying a bias field modulation to counter the effects of wall motion coercivity is used. An attempt is made to include this mechanism in the theoretical description. (12 refs.)

102717 Corner clusters in thin soft magnetic layers. The corner cluster—a system of walls. H.A.M.van den Berg (Dept. of Electrical Engng., Delft Univ. of Technol., Delft, Netherlands).
J. Appl. Phys. (USA), vol.54, no.8, p.4512-19 (Aug. 1983).
The domain-wall cluster is a new concept revealing a large number of features about the domain structure and its conversions in thin soft magnetic layers, as used in field-access bubble devices and in integrated tape recorder heads. A wall cluster is a collection of domain walls having one intersection

line, the so-called cluster knot, in common. This paper is confined to the relations in the mutual domain-wall positions in the corner clusters, characterized by a cluster knot that coincides with a corner of the geometry. A one-to-one relationship between the domain-wall positions and the magnetization distribution near the corner exist in a special class of corner clusters, the so-called completely uniform corner clusters. It is shown under which conditions this type of cluster might or have to occur. The other class of corner clusters contains rotation segments, defined as sectors in which the magnetization rotates circularly around the cluster knot. The circulation sense of the magnetization in the rotation segments of a specific cluster is the same for all segments. The magnetization distribution possible in this class of clusters systematically come up for review. Consequently, the paper offers a framework for the interpretation of the observations obtained in the Bitter, TEM and Kerr techniques. (14 refs.)

102718 The description of the domain structure in thin ferromagnetic films with thickness near the critical value. M.Gajdek (Dept. of Phys., Tech. Univ., Kielce, Poland), W.Wasilewski.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.246-52 (July 1983).
The magnetization distribution is considered in a thin ferromagnetic film of a thickness near the critical value, for which the continuous phase transition from the homogeneous magnetization state to the domain structure appears. The easy axis of the magnetization is perpendicular to the film plane and the anisotropy constant $\beta<4\pi$. On the basis of the self-consistent theory the vortex-like magnetization distribution in the interdomain wall was obtained. The value of the critical thickness, the period of the domain structure and the amplitudes of the magnetization vector components as dependent on the film parameters were derived. (12 refs.)

102719 Magnetic domain structures in deformed and undeformed foils of a metallic glass. P.E.Donovan, W.M.Stobbs (Dept. of Metall. & Materials Sci., Cambridge Univ., Cambridge, England).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.257-66 (July 1983).
The magnetic domain structure of amorphous Co-P films was examined by transmission electron microscopy. A combination of in-situ annealing and magnetisation treatment was used to investigate the relative pinning effects of the surface relief, structural changes and long range stresses associated with the formation of deformation bands. (16 refs.)

102720 Determination of average domain size on Permalloy and Perminvar by means of complex permeability measurements. G.Ban, P.Arato, L.Szentmiklosi (Metalplant of Csepel Works, Budapest, Hungary).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.309-14 (July 1983).
Experiments were performed on industrial purity materials of 0.10-0.35 mm strip thickness. The authors tried to apply both the Polivanov bowing wall and the Pry-Bean rigid wall model for characterizing the domain structure of the materials. It was proved experimentally that the main features of domain structure are in agreement with the assumptions of the bowing wall model. By means of fitting theoretical spectra on measured complex permeability spectra, the average size of domains as a function of thickness and annealing temperature was determined. The number of domains related to one grain could be associated with changes of initial permeability and coercive force. (7 refs.)

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

102721 The magnetio-elastic properties of the Invar alloy, Fe_3Pt. H.C.Ling (Western Electric Engng. Res. Center, Princeton, NJ, USA), W.S.Owen.
Acta Metall. (USA), vol.31, no.9, p.1343-52 (Sept. 1983).
The variations of the lattice parameter, the Curie temperature (determined from specific heat measurements), and the temperature variation of the elastic constants C, C', and C_L in an applied magnetic field of 0.8 T have all been measured as a function of the long-range order in a single crystal of iron-platinum alloy with very nearly the stoichiometric composition Fe_3Pt. It is found that the Invar effect in partially ordered Fe-25 Pt is larger than in other Fe-Pt alloys or in well-known Invar alloys such as Fe-35 Ni. The results for Fe-25 Pt are analyzed and interpreted in terms of a model of nearest-neighbor exchange interaction which takes account of the spatial variation of the average exchange integral. The best fit with the experimental data is obtained by assuming an average spin of unity. Using ordering as the controlled variable avoids the difficulties inherent in studies which have relied on a compositional variable. The model satisfactorily describes the magnetic contribution to the elastic constants and the variation of Curie temperature with changes in the long-range order. It is concluded that Fe-Pt coupling is ferromagnetic and Fe-Fe coupling antiferromagnetic. (43 refs.)

102722 Influence of the macrostructure of a thin anisotropic Fe-3% Si ribbon on electromagnetic losses as a result of elastic treatments. V.A.Zaikova, N.K.Esina, Yu.N.Dragoshanskii, A.P.Shtin, T.A.Khanzhina (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1125-32 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the influence of the degree of 'perfection' of the crystallographic texture and of the grain size on the electromagnetic losses occurring in thin Fe-3% Si ribbons subjected to uniaxial elastic stretching or to coating with magnetically active but electrically insulating films. It was found that both stretching and coating reduced the electromagnetic losses in the samples characterized by a high degree of 'perfection' of the structure. (18 refs.)
A.T.

102723 Vibrational modes, elastic stiffness, and piezomagnetic strain of a magnetization rod. L.Lanotte, C.Luponio, F.Porreca (Istituto di Fisica, Univ. degli Studi di Napoli, Napoli, Italy).
J. Appl. Phys. (USA), vol.54, no.8, p.4520-2 (Aug. 1983).
Vibrating-rod experiments in Ni samples, excited by dynamic magnetostriction, reveal three fundamental frequencies: two extensional modes and one shear mode. Both the c_{11}, c_{12}, c_{44} set of microscopic spring constants and the d_{z1}, d_{z3}, d_{r5}, set of piezomagnetic strain constants can be directly evaluated. The frequency changes with a polarizing magnetic field (Δf effect) have been observed for all modes. Suitable elasticity tensors have been written and compared in order to explain the c_{ij} variations from the demagnetized state of saturation. The approach aids interpretation of the observed d_{ij} changes. (10 refs.)

102724 Magnetically induced spatial dispersion of crystals in the exciton region of the spectrum. E.L.Ivchenko, V.P.Kochereshko, G.V.Mikhailov, I.N.Ural'tsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.3, p.164-7 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.137-9 (5 Feb. 1983).
A resonant increase in magnetically induced spatial dispersion of axes in the vicinity of exciton states in crystals without a centre of inversion is predicted. It is found that this effect appears distinctly in regions where the dispersion branches of magnetopolaritons in CdS and CdSe crystals intersect. (7 refs.)

102725 Microscopic approach to magnetostriction of dilute rare-earth alloys. J.Deniszczyk (Inst. of Phys. & Chem. of Metals, Silesian Univ., Katowice, Poland), B.Kozarzewski.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.217-27 (July 1983).
The theory of magnetostriction, formulated previously by one of the authors, is partially extended to arbitrary crystal symmetry and compared with experimental results for AgRE dilute alloys. The field dependence of the forced magnetostriction in the ⟨001⟩ direction of the single crystal sample is in general quite well reproduced by the theory. (17 refs.)

102726 The response of an elastomer filled with soft ferrite to mechanical and magnetic influences. Z.Rigbi (Dept. of Chem. Engng., Technion-Israel Inst. of Technol., Haifa, Israel), L.Jilken.
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.267-76 (July 1983).
The behaviour of a ferrite-elastomer composite is studied under the combined influence of changing elastic stresses and magnetic fields. The instruments used are described, and the results obtained are presented in a series of graphs. The composite behaves erratically unless subjected to a 'shake-down' procedure. In a quasi-stable state, previously unknown magnetomechanical effects are exhibited and described. (10 refs.)

102727 Filtering of fast magnetoelastic waves in a normally magnetized ferrite plate. A.S.Bugayev, Yu.V.Gulyayev, P.Ye.Zil'berman, Yu.A.Filimonov.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.106-10 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1979-84 (Oct. 1982).
The dispersion equation of coupled magnetostatic and elastic waves is investigated in a plane-parallel ferromagnetic plate, normally magnetized to saturation. Magnetoelastic resonances appear at wave phase velocities that are much greater than the velocity of sound in an unbounded medium. Two-, three- and even fourfold resonances are possible. The resonance gaps in the spectrum depend on the rate of occurrence of dissipative processes and they can vanish completely with an increase of this rate. In this situation, however, interesting features appear in the transmission spectrum of the plate in the traveling-wave regime—increased frequency passband widths or nearly complete suppression of waves (signal filtering). The theory formulated for this effect makes it possible to estimate the location, shape and width of the transmission or suppressions peaks. In particular, the relative width of the peaks is $\sim 10^{-5}$-10^{-3}. (7 refs.)

75.90 OTHER TOPICS IN MAGNETIC PROPERTIES AND MATERIALS

102728 Role of surface interactions in stratification of magnetic fluids. A.O.Tsebers.
Magnetohydrodynamics (USA), vol.18, no.4, p.345-51 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.21-7 (Oct.-Dec. 1982).
The average-field approximation provided a basis for the formulation of a thermodynamic model that showed the possibility of phase stratification of a magnetic fluid (MF). Stratification of an MF into concentrated and dilute phases is possible if the magnetodipole interaction parameter of the colloidal particles $\gamma=m^2/(2r)^3kT$ (m is the magnetic moment of the ferroparticle, 2r is the distance between the centers of the ferroparticles at their minimum distance apart) is greater than some critical value, which, generally speaking, depends on the external field strength. This dependence is given in this paper. (5 refs.)

102729 Temperature dependence of the paramagnetic resonance linewidth of Cr^{+3} ion in powdered $AgCrO_2$ sample. M.Krygowska-Doniec, J.Kwiatkowska (Inst. of Nuclear Phys., Cracow, Poland), M.Stojic, V.Spiric.
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.143-6 (July 1983).
Electron paramagnetic resonance in $AgCrO_2$ powder is investigated. Measurements are performed in the X-band and in temperature range from 20K to 300K. The resonance line width is strongly dependent on temperature. The mechanisms of the line width change are discussed. The spectroscopic splitting factor, g, and effective magnetic moment associated with $^4A_2$ ground state is determined and the shape of ERP lines in the whole range of temperature is analysed. (15 refs.)

102730 ESR of Mn^{2+} ions in ZnP_2 and structural correlations. B.Frick, D.Siebert (Inst. fur Phys. Chem., Univ. Freiburg, Freiburg, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.7, p.558-62 (July 1983).
In tetragonal ZnP_2 paramagnetic Mn^{2+} substitutes for the Zn^{2+} ions that are all equivalent. The hyperfine structure constant A of the paramagnetic Mn^{2+} centre was $53(2) \times 10^{-4}$ cm^{-1}. Measurements of the optical activity revealed a characteristic twinning of the red, plate-like crystals. In monoclinic ZnP_2 two different Mn^{2+} centres could be detected in accordance with two different Zn sites. A site assignment was possible by considering a pseudo-orthorhombic unit. The same assignment was obtained by comparing the orientations of the centres' axes with calculated directions of the axes of crystal field tensors. The agreement of the A values of the two different centres in monoclinic ZnP_2 among themselves and with the A value in tetragonal ZnP_2 supports a structure without Zn-Zn bonds for the monoclinic modification. (10 refs.)

102731 Photochromic reactions involving Cr ions and defects in magnesium oxide. R.C.Barklie, C.E.Blount, B.Henderson, D.O'Connell.
J. Phys. C (GB), vol.16, no.23, p.L859-62 (20 Aug. 1983).
Electron spin resonance (ESR) measurements are reported for Cr^+ ions occupying octahedral symmetry sites in MgO. The spin Hamiltonian parameters are: $a=(4.18 \pm 0.02)$ mT; $A=(1.86 \pm 0.02)$ mT; $g=1.9997(4)$. These monovalent ions are produced in additively coloured MgO by optical excitation at 77K in the wavelength range 250-600 nm, presumably by the photoconversion of Cr^{2+} ions. The Cr^+ state is stable at 77K but decays on warming to room temperature. Photoconversion of F centres$\rightarrow F^+$ centres also proceeds during optical excitation, mainly but not exclusively in the F band. Such optical excitation is found to change the effective spin-lattice relaxation time for F^+ centres. There is no correlation between the optical creation of Cr^+ ions and the photoconversion of $F \rightarrow F^+$ centres. (7 refs.)

102732 Reinterpretation of the state of paramagnetic vanadium species in aluminophosphates. M.Narayana, L.Kevan (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
J. Phys. C (GB), vol.16, no.23, p.L863-6 (20 Aug. 1983).
The ESR parameters of vanadium species in oxide-type matrices are reviewed and a reassignment of the paramagnetic vanadium species in aluminophosphates from V^{4+} to VO^{2+} is proposed. (22 refs.)

102733 A trigonal Mn^{2+} centre in SrF_2:Mn. R.Alcala, P.J.Alonso, R.Cases (Dept. de Fisica Fundamental, Univ. de Zaragoza, Zaragoza, Spain).
J. Phys. C (GB), vol.16, no.23, p.4693-700 (20 Aug. 1983).
The EPR spectrum of 'as grown' SrF_2:Mn crystals has been measured. In addition to the well known signal due to cubic Mn^{2+} ions a new Mn^{2+} signal having trigonal symmetry has been observed. The EPR data have been explained using the spin Hamiltonian $\mathcal{H}=g\mu_B \mathbf{S}.\mathbf{H}+D[S_z{}^2-{}^1/_3 S(S+1)]+A\mathbf{S}.\mathbf{I}+\mathcal{H}_{SHF}$ with $S={}^5/_2$, $I={}^5/_2$ and the z axis along a $\langle 111 \rangle$ direction. The values obtained for the parameters are: $g=2.004 \pm 0.005$, $|D|=1615 \pm 10$ MHz, $|A|=265 \pm 10$ MHz with A and D having the same sign. The evolution of the EPR spectrum when measured at different temperatures is also reported. A linear dependence of D on temperature has been found. Changes induced by thermal treatments and low-temperature X-irradiations are given. A tentative model for the manganese centre responsible for the trigonal EPR signal that consists of a fluorine vacancy next to a substitutional Mn^{2+} ion is proposed. (20 refs.)

102734 Electron spin resonance of VO^{2+} in K_2SO_4-$ZnSO_4$ glasses. V.P.Seth, V.K.Jain, R.K.Malhotra (Dept. of Phys., MD Univ., Rohtak, India).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.199-201 (Aug. 1983).
Sulphate glasses prepared from K_2SO_4-$ZnSO_4$ systems can be obtained over a wide range of binary compositions. The authors report the ESR of VO^{2+} ions in K_2SO_4-ZnO_4 glasses at 288K. The ESR spectrum of VO^{2+} ions in K_2SO_4-$ZnSO_4$ glass shows a structure which is characteristic of a hyperfine interaction of a single upaired electron with a ^{51}V (99.8% abundant, spin $I={}^7/_2$) nucleus. The spectra were analysed using an axial spin-Hamiltonian. (8 refs.)

102735 Optical and electron spin resonances studies of copper(II), nickel(II) and oxovanadium(IV) complexes of water-soluble phthalocyanine and porphyrazine chelates absorbed on Sephadex resins, and the effect of added dithionite. A.Skorobogaty, R.Lancashire, T.D.Smith (Chem. Dept., Monash Univ., Clayton, Victoria, Australia), J.R.Pilbrow, G.R.Sinclair.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1123-41 (July 1983).
Electronic and ESR spectral data show that the solute-solute interactions which prevail in aqueous solutions containing copper(II) and oxovanadium(IV) chelates of tetrasulphophthalocyanines persist when the chelates are adsorbed onto the anion exchanger Sephadex DEAE. The distribution of the copper(II) and oxovanadium(IV) into polymeric, dimeric and monomeric species may be adjusted by equilibration of the resin with aqueous solutions containing various amounts of dimethylformamide, which when present in high proportions effects a distribution largely of the monomeric forms. The tetracationic copper(II), cobalt(II) and oxovanadium(IV) tetra-*N*-methyl-2,3-tetrapyridinoporphyrazine chelates, which are free of solute-solute interactions in aqueous solutions, are absorbed in a monomeric distribution on the cation sites of the cation exchange Sephadex CM. A two-electron reduction of the copper(II) and oxovanadium(IV) tetrasulphophthalocyanine chelates occurs in their aqueous solution and while absorbed on the resin as a result of reaction with an aqueous solution of dithionite, whereafter the vanadyl complex has a $g_{\parallel}$ value of 2.024. Reduction occurs by electron addition to the macrocyclic ring system. (19 refs.)

102736 Tetragonal distortions in the Jahn-Teller active copper pyridine-N-oxide complexes. Comparison of experimental and theoretical EPR parameters. C.P.Keijzers, G.van Kalkeren, E.de Boer (Dept. of Phys. Chem., Univ. of Nijmegen, Nijmegen, Netherlands), J.S.Wood.
Mol. Phys. (GB), vol.49, no.5, p.1187-97 (10 Aug. 1983).
The Jahn-Teller (JT) and the EPR parameters of the trigonal, JT-active hexakispyridine-N-oxide complex $Cu(C_5H_5NO)_6{}^{2-}$ are calculated from the results of extended Huckel molecular orbital calculations on a series of distorted geometries of this complex. These geometries are obtained from a recent, low temperature, neutron diffraction study and compared with a monoclinic, static, modification of the corresponding nitrate complex. For two different distortion models, the JT minimum is obtained for a tetragonally elongated octahedron. The JT parameters are in very reasonable agreement with the experimental ones. The EPR parameters are compared with newly determined experimental values obtained by a re-evaluation, using matrix diagonalization instead of a perturbation treatment, of earlier measurements on $Cu(C_5H_5NO)_6(BF_4)_2$ at 4.2K and on $Cu(C_5H_5NO)_5DMF(ClO_4)_2$ at room temperature. On the basis of these computations, the EPR parameters, and especially the very small isotropic copper hyperfine coupling, can be understood. (19 refs.)

102737 EPR study of electronic and magnetic properties of bis(*DL*-α-amino-*n*-butyrato) copper (II). A layered magnetic system. R.Calvo, M.A.Mesa (Inst. Venezolano de Investigaciones Cientificas, Caracas, Venezuela).
Phys. Rev. B (USA), vol.28, no.3, p.1244-8 (1 Aug. 1983).
Single crystals of the copper derivative of the amino acid *DL*-α-amino-*n*-butyric acid were studied by EPR at 300K and 9.3 GHz. Only one exchange-narrowed line was observed for the two inequivalent copper ions in the lattice. The angular variation of its position and linewidth was measured in three perpendicular planes. The data on the position were used to obtain the molecular gyromagnetic factors and the orientation of the molecules within the unit cell. The angular variation of the linewidth shows an important contribution from spin diffusion, as is characteristic of two-dimensional magnetic systems. Anisotropic and antisymmetric exchange interactions contribute also to the linewidth. This two-dimensional behavior of bis(*DL*-α-amino-*n*-butyrato)Cu(II) is supported by existing data on the crystal structure of this salt. A lower limit for the exchange interaction between dissimilar copper ions in the lattice was obtained. (24 refs.)

102738 Hyperfine interactions from EPR of iron in silicon. E.G.Sieverts, S.H.Muller, C.A.J.Ammerlaan (Natuurkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands), E.R.Weber.
Solid State Commun. (USA), vol.47, no.8, p.631-4 (Aug. 1983).
At high microwave power very well resolved EPR spectra from isolated neutral interstitial iron atoms in silicon can be observed. From these spectra hyperfine interactions with at least three shells of neighbouring lattice sites, containing 18 or 22 atoms, can be determined. The localization of the unpaired electron on these sites is only small. On nearest neighbour sites it is found to be even smaller than on next nearest sites. (12 refs.)

102739 Cryochemical studies. VII. Electron spin resonance spectrum of Ag_5. J.A.Howard, R.Sutcliffe (Nat. Res. Council of Canada, Ottawa, Ontario, Canada), B.Mile.
J. Phys. Chem. (USA), vol.87, no.13, p.2268-71 (23 June 1983).
The neutral silver cluster $^{107}Ag_5$ has been prepared in several inert matrices in a rotating cryostat at 77K and its ESR spectrum recorded. The spectrum is anisotropic and can be analyzed in terms of $A_{\parallel}(2)=594.5$ MHz, $A_{\perp}(2)=587.5$ MHz, $g_{\parallel}=2.002$, and $g_{\perp}=2.085$. The superhyperfine interactions associated with the perpendicular features of the spectrum give $A_{107}(2)=5.5$ G and $A_{107}(1)=11$ G. This transition-metal pentamer has a distorted trigonal-bipyramidal structure with a $^2B_2$ in C_{2v} electronic ground state. The SOMO has 5s and 4p and/or 4d orbital contributions of 0.6 and 0.2-0.3, respectively, from two equatorial Ag nuclei. The unique equatorial and axial Ag nuclei have a small percentage of negative unpaired 5 s spin population. (50 refs.)

102740 Magnetic resonance of the B_2O_3-Na_2O-MoO_3 vitreous system. S.Simon, A.Nicula (Faculty of Phys., Univ. of Cluj, Cluj, Rumania).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.23-39 (Aug. 1983).
The structure and properties of molybdenum-doped soda-borate glasses were studied by means of electron paramagnetic resonance as functions of the molybdenum oxide concentration in the range 1-25 mol% MoO_3, the keeping time of the samples at the preparation temperature in the range of 15-180 min, the preparation temperature in the range of 900-1300°C, and the soda-borate matrix composition in the range 0-34 mol% Na_2O. The EPR measurements gave evidence of the existence of three types of site for the Mo^{5+} ions, their relative fraction as well as the paramagnetic center density and the EPR lineshape symmetry being dependent on the above-mentioned factors. The evolution of the ^{11}B NMR lineshape in the studied samples also showed that the fourfold-coordinated boron atoms fraction is greatly influenced by the modification of these factors. The good agreement between the structural information obtained by ^{11}B NMR and Mo^{5+} EPR studies recommends the EPR spectra of Mo^{5+} ions as an excellent sensor for the structure of the borate glasses. (22 refs.)

102741 Investigations of the stability of the neutral silver atom in $Na_xAg_{1-x}Cl$ mixed crystals by EPR-spectroscopy. T.Muessig, F.Granzer (Inst. fur Angewandte Phys., J.W. Goethe-Univ., Frankfurt/Main, Germany).
Radiat. Eff. (GB), vol.72, no.1-4, p.123-37 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
In most of the theories of the photographic process in the classical silver halide systems, the neutral silver atom, Ag^0, still plays an important role. Up till now, however, all attempts failed to detect the Ag^0 in pure AgCl and AgBr, while its detection in NaCl, weakly doped with Ag, does not impose any problems applying EPR-spectroscopy. Benefiting from some peculiarities of the NaCl-AgCl-phase diagram, $Na_xAg_{1-x}Cl$-mixed crystals were grown and the stability of the Ag^0-centre with increasing Ag-content was followed by EPR-measurements. From the results obtained by gradually augmenting the Ag-content up to 30 mol.% and cooling down the crystals to 20K, there seems to be only little chance, to detect the neutral silver atom in pure AgCl, even at very low temperatures by EPR-spectroscopy. Simultaneously the EPR-signal of the Ag^{2+}-centre was studied and the occurrence of a very strong EPR-line at $g=1.88$ in decomposed mixed crystals was interpreted. (10 refs.)

102743 The ⟨110⟩ oriented FCl^- molecule-ion in KF. C.J.Delbecq, E.Hutchinson, P.H.Yuster (Argonne Nat. Lab., Argonne, IL, USA), S.A.Marshall.
J. Chem. Phys. (USA), vol.79, no.3, p.1408-15 (1 Aug. 1983).
The heteronuclear diatomic molecule-ion FCl^- with its molecular axis oriented along a crystal face diagonal, i.e. FCl^- ⟨110⟩, has been produced by ionizing radiation in single crystal KF doped with $PbCl_2$ and KCl. Evidence to support this species identification as well as its orientation relative to the lattice is obtained from anisotropic optical absorption spectral measurements as well as from electron spin resonance (ESR) absorption spectra. Optical absorption spectral data, estimates of the molecular reorientation temperature, as well as ESR absorption spectral parameters are given for the FCl^- ⟨110⟩. A qualitative explanation of the differences of the optical and ESR parameters of FCl^- ⟨111⟩ and FCl^-⟨110⟩ is discussed. (27 refs.)

102744 ESR of a new sulphur centre in KCl. F.Callens, P.Matthys, E.Boesman (Lab. voor Kristallografie, Rijksuniv. Gent, Gent, Belgium).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K35-7 (1 July 1983).
The authors have previously analysed the ESR spectra of two new sulphur centres in NaCl. In order to investigate further the models proposed for these paramagnetic defects, respectively (very likely) an S_2^- ion and (tentatively) an S^- centre, they have studied the ESR of KCl, similary doped with potassium polysulfide. (9 refs.)

102745 Paramagnetic states in doped amorphous silicon and germanium. M.Stutzmann, J.Stuke (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
Solid State Commun. (USA), vol.47, no.8, p.635-9 (Aug. 1983).
ESR-results for doped hydrogenated amorphous silicon and germanium are discussed. g-values and linewidths of the resonances as well as effective correlation energies of the corresponding energy states are compared for both materials. It is shown that the existing large differences of these quantities between a-Si:H and a-Ge:H can be explained by the differences of spin-orbit coupling and degree of localization. (14 refs.)

102746 Defect characterization in III-V compounds by ESR. J.Schneider (Fraunhofer-Inst. fur Angewandte Festkorperphys., Freiburg, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.329-30 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Summary form only given. A summary of present knowledge on $3d^n$ transition metal impurities in GaP, GaAs and InP, as obtained by ESR, is given. The author discusses in detail the current ESR and ODMR investigations on the anion antisite defects P_{Ga}:GaP and As_{Ga}:GaAs. These basic and native point defects are very characteristic for III-V compounds; they are also suspected to play a key role in devices, in a deleterious as well as in a beneficial manner. Finally, the present state of ESR studies on radiation induced defects in GaP, GaAs and InP is summarized. (1 ref.)

102747 Light induced ESR spectra in rutile powders. S.W.Hodgskiss, J.S.Thorp, G.Brown (Dept. of Appl. Phys. & Electronics, Univ. of Durham, Durham, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2361-70 (Aug. 1983).
A series of rutile powders has been examined by electron spin resonance techniques before and after ultraviolet irradiation at low temperautres. Prior to irradiation a broad line was seen at 4.2K whose g-value ($g \approx 1.955$) was similar to that reported by Iyengar in hydrogen-reduced rutile. After ultraviolet irradiation at 4.2K a new line was observed. Computer simulation techniques showed that the best fit to the observed lineshape was obtained by taking $g_1=g_2=2.0077$ and $g_3=2.015$ with Lorentzian broadening. Isochronal annealing of this centre showed marked decreases in the signal intensity at both 10 and 80K; these are attributed, respectively, to thermal release of electrons from a shallow and a deep electron trap giving recombination at the centre. (15 refs.)

102748 Interstitial Tl^0 atoms in alkali halides: ESR study of a ⟨111⟩-oriented Tl_2^+ center. S.V.Nistor, E.Goovaerts, B.-r.Yang, D.Schoemaker (Phys. Dept., Univ. of Antwerp, Wilrijk, Belgium).
Phys. Rev. B (USA), vol.28, no.3, p.1219-26 (1 Aug. 1983).
A ⟨111⟩-oriented Tl_2^+ center is produced above 220K by X-ray irradiation of Tl^+-doped KCl and RbCl. A careful analysis of the X-band electron-spin-resonance spectra establishes that the two Tl nuclei are equivalent, which implies that the center possesses inversion symmetry. The model proposed is a Tl_2^+center on a single cation site. Its production is believed to involve the trapping of a mobile anion vacancy between a distant pair of substitutional Tl^+ impurities and the trapping of an electron in whatever order, an asymmetric relaxation of a Tl_2^+ center towards a cation site and the diffusing away of a divacancy. In a formal sense this Tl_2^+ center may be viewed as being an interstitial Tl^0 atom trapped by a substitutiona Tl^+ impurity, although no mobile interstitial Tl^0 as such is produced by the X-ray irradiation. Its structure is formally analogous to the interstitial halogen atom center, the H center. The possible effect of the presence of ⟨111⟩-oriented Tl_2^+ on the lasing properties of $Tl^0(1)$ centers is briefly discussed. (28 refs.)

102749 Optically and X-ray-induced paramagnetism in amorphous phosphorus. B.V.Shanabrook (Naval Res. Lab., Washington, DC, USA), P.C.Taylor.
Phys. Rev. B (USA), vol.28, no.3, p.1239-43 (1 Aug. 1983).
Two metastable and characteristically different paramagnetic centers are observed by electron-spin resonance (ESR) in amorphous phosphorus (a-P) after either X-ray irradiation or optical excitation below 77K. The wave function of the one center, P_1, is probably localized on a single phosphorus atom and may be identical to centers which exist before optical excitation (dark ESR). The second center, P_2, is characterized by a wave function which is localized on two equivalent phosphorus atoms. The relative intensities of P_1 and P_2 depend upon the excitation source (X-ray irradiation or optical excitation). The metastable P_2 densities decrease rapidly above 80K while those of P_1 decrease more slowly with temperature. Both P_1 and P_2 can be optically bleached with below-band-gap light. Both the bleaching and inducing processes appear to saturate quickly compared to previous measurements on the chalcogenide glasses. There is little increase in the dark ESR with temperature. 102750 Observation of the methyl radical CH_3 in irradiated, high-purity synthetic fused silica. E.J.Friebele, D.L.Griscom (Naval Res. Lab., Washington, DC, USA), K.Rau.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.167-75 (Aug. 1983).
Stable methyl radicals CH_3 have been observed in irradiated high-purity synthetic silicas by electron spin resonance techniques. Analysis of the dependence of the linewidth on the nuclear spin quantum number of the ESR spectrum demonstrates that the radicals tumble at a frequency of ~11 MHz. The authors suggest that this small tumbling rate as compared with the 'free' rotation rate of 10 GHz is due to interaction of the radical with the glass network. Radicals were observed in concentrations of $\sim 3\times 10^{13}$/g SiO_2 in samples fused in a hydrocarbon-oxygen flame, but no radical concentration could be measured in samples fused in either an electric arc or hydrogen-oxygen flame. The methyl radical is presumed to form by radiodissociation of either CH_4 or CO dissolved in the silica during the fusion process and subsequent reaction of C with radiolytic H. (12 refs.)

102751 Influence of chain length on conformations of poly(ethylene glycol) chains grafted on silica [ESR observations]. H.Hommel, A.P.Legrand (Lab. de Phys. Quantique, ERA, Paris, France), H.Balard, E.Papirer.
Polymer (GB), vol.24, no.8, p.959-63 (Aug. 1983).
Electron spin resonance spectroscopy of labelled grafted poly(ethylene glycol) chains has been used to estimate the ratio of the population of end segments free in solution to that of ones adsorbed on the silica surface, as a function of temperature. In particular, the influence of chain length is investigated. The grafted molecules have the following molecular weights, 44, 88, 132, 176, 400, 600, 2000, and are in contact with benzene. Taking the random walk models as reference, two different behaviours are distinguished, one for the oligomers and one for the polymers. The measured values are consistent with an overall picture of 'brush bristles' for oligomers and of weakly overlapping partly collapsed coils for polymers. (28 refs.)

102752 An ESR investigation of environmental effects on polymeric materials. II. Polyethylene. M.Igarashi, K.L.DeVries (Coll. & Engng., Univ. of Utah, Salt Lake City, UT, USA).
Polymer (GB), vol.24, no.8, p.1035-41 (Aug. 1983).
The authors report results on the effect of various environments, O_3, NO_x, SO_2, UV irradiation, combined with stress on the mechanical degradation of polyethylene. Mechanical strength, toughness, free radical production and changes in molecular weight are reported as functions of the ageing time in these environments and at sustained strains corresponding to as much as 90% of the fracture stress for the oriented material and corresponding to the onset of necking in the unoriented material. The results are compared to those previously reported for nylon and discussed in terms of possible molecular mechanisms active during polymer fracture. (8 refs.)

76.40 DIAMAGNETIC AND CYCLOTRON RESONANCES

102753 High-frequency doppleron excitations in metals. A.Yu.Romanov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1070-8 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An arbitrary axially symmetric Fermi surface is considered and solutions are found of the dispersion equation in the vicinity of a Doppler-shifted cyclotron resonance at frequencies higher than the threshold frequency of the usual

dopplerons. Such excitations have a circular polarization. The dispersion curves are derived for high-frequency dopplerons in a wide range of frequencies right up to the cyclotron value. It is shown that high-frequency dopplerons can propagate through the transparency 'windows'. (9 refs.) *A.T.*

102754 Resonant free-induction signals in metals in high vacuum. B.P.Smolyakov, E.P.Khaimovich.
JETP Lett. (USA), vol.37, no.2, p.116-18 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR),* vol.37, no.2, p.95-7 (20 Jan. 1983).
An emission signal has been observed in several metals after an intense microwave pulse. The signal has a resonance in the magnetic field with a decay time $\sim 10^{-4}$ s. The effect apparently results from the appearance of electron surface states on metal sampled in high vacuum. (6 refs.)

102755 Detection of exchange modes in quasi-two dimensional antiferromagnet $(NH_3)_2(CH_2)_3MnCl_4$. A.A.Stepanov, M.I.Kobets, A.I.Zvyagin.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.764-5 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The antiferromagnet resonance (AFMR) of a quasi-two-dimensional antiferromagnet $(NH_3)_2(CH_2)_3MnCl_4$ is studied in the frequency range of 20 to 180 GHz at helium temperature. Optical (or exchange) branches in the AFMR spectrum are detected alongside with the acoustic branches, and their frequencies are determined. (4 refs.)

102756 Low power nonlinear effects in the ferromagnetic resonance of Zn_2Y and MnZnY hexagonal ferrites. L.M.Silber, C.E.Patton, H.F.Naqvi (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4071-5 (July 1983).
The room temperature ferromagnetic resonance (FMR) absorption at 8.9-11.2 GHz in two planar hexagonal ferrites, Zn_2Y and MnZnY, has been found to exhibit strong nonlinear behavior at low power levels corresponding to microwave field amplitudes on the order of 10 mOe. For somewhat larger amplitudes, 20-50 mOe, the asymmetric resonance curves show pronounced foldover effects. With increasing static field, the absorption increases gradually to a steep cutoff at a field several hundred Oe above the position of the low power FMR. With decreasing field, a sharp spike occurs coincident with the high field tail of the low power FMR line, followed by a gradual decrease which tracks the upsweep absorption. The detailed shapes of these curves depend strongly on sweep rate. Steady-state absorption curves at the highest powers employed, with 350 mW incident power and a microwave field amplitude of 58 mOe, result only for very slow sweep rates of 20 Oe/min or less. (16 refs.)

76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

102757 High-resolution NMR spectrometry of solids. II. B.C.Gerstein (Dept. of Chem., Iowa State Univ., Ames, IA, USA).
Anal. Chem. (USA), vol.55, no.8, p.899a-907a (July 1983).
The author discusses applications of transient techniques in NMR to studies of polymers, biopolymers, and fossil fuels. Also discussed are recent technical and theoretical advances, including magnetic angle spinning at low temperatures, recovery of shielding anisotropies in systems with many chemically distinct nuclei, slow spinning, high-resolution NMR of nuclei with quadrupole moments, and multiple-quantum NMR. (24 refs.)

102758 ^{57}Fe NMR spectra in domain walls of hexagonal ferrites with magnetoplumbite structure. H.Stepankova, J.Englich, B.Sedlak (Faculty of Maths. & Phys., Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.816-25 (1983).
The domain wall NMR spectra of ^{57}Fe were measured on polycrystalline samples of $BaFe_{12}O_{19}$ and $SrFe_{12}O_{19}$ at 4.2K. The authors have calculated the anisotropy of the hyperfine field dipolar component. The measured NMR spectra were interpreted supposing that the hyperfine field anisotropy is caused only by the dipolar field anisotropy. (10 refs.)

102759 Free precession of ^{165}Ho nuclei in a single crystal of holmium iron garnet. O.Prakash, M.A.H.McCausland (Schuster Lab., Univ. of Manchester, Manchester, England).
J. Phys. C (GB), vol.16, no.24, p.L903-6 (30 Aug. 1983).
A well resolved seven-line NMR spectrum has been obtained by measuring the frequency dependence of the free precession signal from holmium nuclei, following a $\pi/2$ pulse, in a single crystal of HoIG at 4.2K. The power- and field-dependence of the signals show that they come from nuclei within domains. The zero-field spectrum has been fitted to a nuclear spin Hamiltonian with dipolar, quadrupolar and octupolar terms. From the measured magnetic dipole splitting the authors deduce that the holmium moment at at least one of the two inequivalent crystallographic sites is (8.065 ± 0.025) μ_B. This result contradicts a recent neutron diffraction study in which the moments assigned to the two sites were (6.0 ± 0.5) μ_B and (9.9 ± 0.5) μ_B. Relaxation behaviour of holmium nuclei in the garnet single crystal is contrasted with results previously obtained from a powder sample of HoIG. (14 refs.)

102760 Magnetic properties of new organic metals. Introduced by the example of the fluoranthene-radical cation salts. E.Dormann (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.220-5 (July 1983). In German.
With chains of adjacent plate-shaped organic molecules, such as bis-fluoranthene-hexa fluoro phosphate $(FA)_2PF_6$, metallic properties have been established by measurements of their magnetic susceptibility, electron spin resonance, ESR, and nuclear magnetic resonance, NMR. Local magnetic measurements offer a better criterion of the metallic properties of such organic substances than electrical conductivity, because of the short mean free path of the charged particles which they contain. The order of magnitude of the mean free path is in these cases only of the order of the lattice constant of the single crystal, supposing that this single crystal is chemically pure and mechanically perfect. The temperature dependence of the molar magnetic susceptibility of $(FA)_2PF_6$ can be divided into three temperature ranges. There is the 'metallic' high temperature phase above 190K, the range between 120 to 180K, and the range below 120K. Below 120K there is a difference between the temperature dependence of the total susceptibility and that of the paramagnetic ESR-susceptibility. (15 refs.) *R.S.*

102761 A ^{13}C-NMR study of the microstructure of polyphenylacetylenes prepared with $MoCl_5$ and WCl_6. V.Percec (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA), R.L.Rinaldi.
Polym. Bull. (Germany), vol.9, no.10-11, p.548-55 (April 1983).
The microstructure of polyphenylacetylenes prepared with $MoCl_5$ and WCl_6 catalysts in several solvents was studied by ^{13}C-NMR spectroscopy. Use of $^{13}C\{^1H\}$ INEPT (insensitive nuclei enhanced by polarization transfer) experiment aids the resonance assignments of cis, trans and cyclohexadiene structural units. The NMR spectral data confirm previous findings regarding the roles of isomerization prior to double bond formation and thermal isomerization after double bond formation in the mechanism responsible for the control of polymer microstructure and molecular weight. (20 refs.)

102762 ^{13}C-NMR studies of thermally isomerized polyphenylacetylenes prepared with $MoCl_5$ and WCl_6 catalysts. V.Percec, P.L.Rinaldi (Case Western Reserve Univ., Cleveland, OH, USA).
Polym. Bull. (Germany), vol.9, no.12, p.582-7 (May 1983).
^{13}C-NMR studies of thermally treated polyphenylacetylenes (PPA) prepared with $MoCl_5$ and WCl_6 catalysts provide evidence for intramolecular cyclization and chain scission of both cis and trans polymers. The microstructures of thermally treated cis and trans PPA are different from the microstructure of trans PPA obtained by thermal isomerization during propagation. (20 refs.)

102763 Density of states at each carbon layer of K-intercalated HOPG compounds-high resolution ^{13}C NMR experiment. K.Kume, Y.Maniwa (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan), H.Suematsu, S.Tanuma.
Solid State Commun. (USA), vol.47, no.7, p.537-40 (Aug. 1983).
The authors have observed high resolution ^{13}C NMR spectra in K-intercalated stages 2,3,4 and 6 HOPG compounds. The sample was a block itself or sliced one of HOPG. From T_1T of each resolved line they obtained a distribution of density of states $N(E_F)$ at the Fermi level among the graphite layers. (17 refs.)

102764 Pressure effects on the quadrupole coupling constant of ^{7}Li in first stage lithium graphite. C.Marinos, S.Plesko, J.Jonas (Dept. of Chem., Univ. of Illinois, Urbana, IL, USA), J.Conard, D.Guerard.
Solid State Commun. (USA), vol.47, no.8, p.645-9 (Aug. 1983).
The pressure dependence of the experimental ^{7}Li NMR spectra is reported for first stage lithium graphite (LiC_6) intercalation compound at temperatures $T=232$ and 293K. This experiment together with the presented point charge model calculation of the ^{7}Li quadrupole coupling constant (e^2qQ/h) allows an unambiguous determination of the sign of e^2qQ/h which is negative: $e^2qQ/h=-52$ kHz at $p=1$ bar and $T=232$K. The averaged location of the electrons transferred from the Li intercalant to the graphite layers, as estimated in this study, is in excellent agreement with earlier theoretical energy-band calculations. The compressibility of LiC_6 in the c-direction is predicted to be $k_c=1.7 \times 10^{-12}$ cm^2 dyn^{-1}, it agrees with estimates derived from the available phonon dispersion relations. (20 refs.)

102765 Solid-state multiple-pulse proton NMR studies of doped poly(*p*-phenylene). J.B.Miller, C.Dybowski (Dept. of Chem., Univ. of Delaware, Newark, DE, USA).
Synth. Met. (Switzerland), vol.6, no.1, p.65-8 (June 1983).
Reports studies of the proton resonance in poly(*p*-phenylene) using multiple-pulse NMR techniques which indicate that these techniques may be useful for probing the environment of such doped conductive polyphenylenes. Many substances have been found to be good dopants for PPP, including electron donors such as metal naphthylides and the pure metals and alloys of lithium, sodium, and potassium, and electron acceptors such as arsenic pentafluoride, antimony pentachloride, fluorosulfonic acid, iodine pentafluoride, and ferric chloride. The authors' studies include PPP doped with all of these except arsenic pentafluoride, the metal alloys, and lithium. (10 refs.)

76.60C Chemical and Knight shifts

102766 ^{15}N NMR chemical shifts in solid NH_4^+ salts. C.I.Ratcliffe, J.A.Ripmeester, J.S.Tse (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.177-80 (29 July 1983).
^{15}N NMR CP/MAS spectra of solid NH_4^+ salts show substantial chemical shift differences. Ab initio calculations indicate that changes in NH_4^+ geometry and anion environment can account for the range of shifts. (14 refs.)

102767 Hydrogen bonding and conformational effects on ^{13}C NMR chemical shifts of hydroxybenzaldehydes in the solid state. F.Imashiro, S.Maeda, K.Takegoshi, T.Terao, A.Saika (Dept. of Chem., Kyoto Univ., Kyoto, Japan).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.190-2 (29 July 1983).
In high-resolution solid-state CP/MAS ^{13}C NMR spectra of several hydroxybenzaldehydes, the downfield shifts due to hydrogen bonding for the carbonyl carbons are found to vary inversely with the O...O hydrogen-bond distances. Conformations of the aldehyde groups in the solid state are determined by the chemical shifts of the orthocarbons. (14 refs.)

76.60E Relaxation effects

102768 Nuclear magnetic relaxation of water nuclei. A study on anisotropic behavior. C.W.R.Mulder, J.Schriever, J.C.Leyte (Dept. of Phys. Chem., Univ. of Leiden, Leiden, Netherlands).
J. Phys. Chem. (USA), vol.87, no.13, p.2336-42 (23 June 1983).
Nuclear magnetic relaxations of the three water nuclei (^1H, ^2H, and ^{17}O) are studied theoretically. A graphical presentation of the relative relaxational behavior of the water nuclei is given and conclusions are drawn with respect to detectability of anisotropic motion by NMR and the usefulness of ^{17}O-enriched samples to analyze such motion. (21 refs.)

102769 Nuclear magnetic relaxation of solvent nuclei in concentrated aqueous poly(methacrylic acid) solutions. C.W.R.Mulder, J.Schriever, W.J.Jesse, J.C.Leyte (Dept. of Phys. Chem., Univ. of Leiden, Leiden, Netherlands).
J. Phys. Chem. (USA), vol.87, no.13, p.2342-8 (23 June 1983).
The nuclear magnetic relaxation times of the water nuclei, i.e. ^1H, ^2H, and ^{17}O, and the polymer protons have been measured in concentrated, aqueous, fully neutralized solutions of three isotopically different forms of poly(methacrylic acid) (PMA, fully protonated, CD_2 deuterated, and fully deuterated). From these results it could be shown that cross relaxation between the polymer and water proton fractions is not important in the systems investigated. The relaxation rates of the three nuclei of the water molecules have been used to investigate the solvent microdynamics using isotropic and anisotropic models for the water motion in the concentrated polyelectrolyte solutions. (31 refs.)

102770 Effect of methyl-group reorientation and spin diffusion on spin-lattice relaxation in some choline and acetylcholine halides. F.Koksal, S.Bahceli (Dept. of Phys., Ankara Univ., Ankara, Turkey).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1107-12 (July 1983).
Spin-lattice relaxation times (T_1) have been measured as a function of temperature for polycrystalline choline chloride and acetylcholine chloride, bromide and iodide. Choline chloride has a single minimum in T_1, but two minima for acetylcholine chloride and bromide have been observed. The T_1 results have been interpreted by considering the reorientational motions of methyl groups about C_3 axis and their role of behaving as sinks to rapid spin diffusion of the other protons in the compounds. The two minima in acetylcholine halides have been shown to be due to the two types of methyl groups in their structures. The activation energies for reorientational motions of methyl groups have been determined. (13 refs.)

102771 Inter and intramolecular contributions to the proton dipolar and rotating frame spin-lattice relaxation times in the nematic phase of the liquid crystal 5*CB*-d_{11}. J.S.Lewis, E.Tomchuk (Dept. of Phys., Univ. of Winnipeg, Winnipeg, Manitoba, Canada), E.Bock.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.387-96 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
As isotopic dilution study of the proton dipolar and rotating frame spin-lattice relaxation times (T_{1D} and T_{1p}) in the nematic liquid crystal 4-cyano-4′-*n*-pentyl-d_{11}-diphenyl (5*CB*-d_{11}) at 13.8 MHz over the nematic phase temperature range was used to separate the intermolecular and intramolecular contributions to the ring proton relaxation rates. Combined with an earlier proton study in inter/intra Zeeman spin-lattice relaxation (T_1) in 5*CB*-d_{11}, these data permit a critical study of the soft-mode dynamics in the system. A qualitative explanation of the T_{1D} results is presented, but a complete explanation of the T_{1p} results is not possible with existing theory. (13 refs.)

102772 Nuclear quadrupolar relaxation and association in liquid In-Sb. M.Elwenspoek, P.Maxim, R.Brinkmann, E.Weihreter, D.Quitmann (Inst. fur Atom- und Festkorperphys., Freie Univ., Berlin, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.435-8 (25 July 1983).
A thermodynamic model of associates is applied to discuss the large increase of nuclear quadrupolar relaxation rate R_Q found in many liquid alloys with compound-forming tendency, by considering the concentration and lifetime of associates. Data for concentration and temperature dependence of R_Q of Sb in $In_{1-c}Sb_c$ are presented and explained by known thermodynamic properties of the alloy; a characteristic time of the order of 10^{-11} s is estimated. (23 refs.)

102773 Enhanced nuclear acoustic resonance in $HoVO_4$. B.Bleaney (Clarendon Lab., Univ. of Oxford, Oxford, England), G.A.D.Briggs, J.F.Gregg, G.H.Swallow, J.M.R.Weaver.
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.479-86 (8 Aug. 1983).
A strong resonant absorption is observed for longitudinal acoustic waves at 800 MHz, propagated along the [100] axis of a single crystal of the enhanced nuclear paramagnet $HoVO_4$, in the presence of a magnetic field in the (001) plane. The strength of the resonant absorption is inversely proportional to the absolute temperature T, with a power attenuation coefficient of $45(1)\times10^2T^{-1}$ m^{-1}. From this and the measured velocity of $6.52(6)\times10^3$ m s^{-1}, a rate of $10^{-3}T$s^{-1} is deduced for the intrinsic direct spin-lattice relaxation process. This is orders of magnitude smaller than the Orbach rate (10^{+4} to 10^{+5} s^{-1} at $T=3$K), and slower than the measured rate at 0.2K, that must therefore be attributed to the presence of paramagnetic impurities. (7 refs.)

102774 Molecular dynamics in the ternary intercalation compounds of graphite with potassium and benzene. A.L.Blumenfeld, E.I.Fedin, Yu.V.Isaev, Yu.N.Novikov (Inst. of Organoelement Compounds, Acad. of Sci., Moscow, USSR).
Synth. Met. (Switzerland), vol.6, no.1, p.15-23 (June 1983).
The proton spin-lattice relaxation was studied in the ternary graphite intercalation compound (GIC) $KC_{24}(C_6H_6)_{2.8\pm0.2}$. The relaxation was governed by the reorientations of the benzene molecules, and two types of benzene molecules with different reorientation behaviour were observed in this compound. In the thermal decomposition product of $KC_{24}(C_6H_6)_{2.8\pm0.2}$ the relaxation proceeded via the paramagnetic centers. (11 refs.)

102775 NMR and ESR studies of an undoped conjugated polymer: poly-*p*-phenylene. F.Barbarin, G.Berthet, J.P.Blanc, C.Fabre, J.P.Germain, M.Hamdi, H.Robert (Lab. d'Electronique et Resonance Magnetique, Univ. de Clermont II, Aubiere, France).
Synth. Met. (Switzerland), vol.6, no.1, p.53-9 (June 1983).
Magnetic property measurements (ESR, NMR and DNP) of an undoped aromatic conjugated polymer, poly-*p*-phenylene, have been improved. This analysis was performed on samples synthesized in three different ways. ESR studies at 10 GHz and 35 GHz show that paramagnetic defects strongly depend on the preparation mode and on the thermal treatment of the polymer. The NMR results suggest that two relaxation mechanisms occur in these materials. Moreover, DNP measurements indicate that the paramagnetic species are localized. (15 refs.)

76.60L Spin echoes

102776 Investigation of the nuclear echo phase in ferromagnetic cobalt. E.A.Glozman, V.K.Mal'tsev, A.E.Reingardt, V.I.Tsifrinovich (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1207-9 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The nuclear echo phase is one of the most important characteristics of pulsed NMR. This phase was investigated for thin (~2000 Å) polycrystalline films of ferromagnetic cobalt. The magnetic-field dependence of the echo phase was determined by the behavior of the electron susceptibility. The shift of the echo phase was always twice as large as the shift of the phase of HF pulses applied to a film. (2 refs.) *A.T.*

102777 Molecular weight and temperature dependence of self-diffusion coefficients in polyethylene and polystyrene melts investigated using a modified NMR field-gradient technique. R.Bachus, R.Kimmich (Sektion Kernresonanzspektroskopie, Univ. Ulm, Ulm, Germany).
Polymer (GB), vol.24, no.8, p.964-70 (Aug. 1983).
Self-diffusion in polyethylene and polystyrene melts has been investigated using a modified NMR field-gradient technique. In both polymer examples, self-diffusion coefficients were found to be proportional to $M_W^{-2.0\pm0.1}$ above and below the critical molecular weight M_c. The observation of undeuterated chains in deuterated matrices of varying chain length indicates only relatively weak matrix effects. The influence of internal field gradients, which have previously been reported for polyethylene melts is demonstrated and discussed. Certain peculiarities have been observed in the temperature dependences of the diffusion coefficients. (34 refs.)

76.70 MAGNETIC DOUBLE RESONANCES AND CROSS EFFECTS

76.70D Electron-nuclear double resonance (ENDOR)

102778 Progress in the analysis of defect structures with ENDOR spectroscopy. J.R.Niklas (Univ. of Paderborn, Paderborn, Germany).
Radiat. Eff. (GB), vol.72, no.1-4, p.39-53 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Summarizes progress made in analysing defect structures. For this electron spin resonance has long been a standard tool. However, its applicability is often very limited due to its insufficient power to resolve hyperfine structures, necessary to determine defect structures. Nuclear magnetic resonance provides high resolution, but insufficient sensitivity. The combination of both, electron nuclear double resonance (ENDOR), turned out to be the most powerful technique. However, complicated systems with low symmetry or with several types of defects present simultaneously usually yield very complex ENDOR spectra which cannot be analysed using 'conventional' methods. Considerable progress was made by improving the experimental methods including computer assistance, processing of the data and novel ENDOR measurement techniques. The application and advantages of methods like ENDOR-induced ESR and DOUBLE ENDOR are demonstrated using several recent examples. (57 refs.)

102779 Triple resonance investigation of F centres in BaFCl. R.Bauer, J.R.Niklas, J.M.Spaeth (Univ.-Gesamthochschule Paderborn, Paderborn, Germany).
Radiat. Eff. (GB), vol.72, no.1-4, p.287-92 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
In BaFCl two types of F centres can be produced, where the electron occupies a Cl^- vacancy [$F(Cl^-)$-centres] or an F^- vacancy [$F(F^-)$-centres]. When producing $F(F^-)$-centres the simultaneous production of $F(Cl^-)$-centres cannot be avoided. Both ESR spectra overlap strongly. The ENDOR spectra contain very many lines of both centres and have a very complicated angular dependence. It is shown that the angular dependence of the ENDOR spectra of both F centres can be measured separately by applying a double ENDOR technique (called also triple resonance). The ratio of the signal heights of the ENDOR lines compared to the double ENDOR lines is characteristic for the neighbour shell to which the nuclei involved belong. The use of this effect for the analysis of the spectra and its explanation are discussed. (8 refs.)

76.70H Optical double magnetic resonance (ODMR)

102780 Energy transfer effects in ODMR spectra: a possible source of misinterpretation. J.J.Davies (Dept. of Phys., Univ. of Hull, Hull, England).
J. Phys. C (GB), vol.16, no.23, p.L867-71 (20 Aug. 1983).
For ODMR spectra observed by monitoring the recombination emission from donor-acceptor pairs, it is usually assumed that signals which correspond to increases in emission intensity can be attributed to the donors and acceptors directly involved in the radiative transitions. It is shown that such an interpretation can be in error if energy transfer is important. (8 refs.)

102781 Optical detection of electron spin resonances via magnetic circular polarization of F-center emission. N.Akiyama, Y.Mori, H.Ohkura (Dept. of Appl. Phys., Osaka City Univ., Osaka, Japan).
Radiat. Eff. (GB), vol.72, no.1-4, p.277-81 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
A new method for the optical detection of electron spin resonance, ESR, for both ground and relaxed excited states of F centers has been tested for KBr,

KI and RbCl using microwave radiation at 49.8 GHz and detecting the microwave-induced change in magnetic circular polarization of F center emission. The g-values and half-widths are tabulated. The dependence of ESR signal intensities of KBr on microwave power, laser power, and pumping photon energy are measured and explained in terms of forms derived from the solutions of rate equations for the optical pumping cycle proposed. 76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

102782 Influence of Sn, V, Cr, Mo, Nb and Ta admixtures on the local environment of Fe impurity atoms in α-Zr. V.V.Igrushin, V.G.Kirichenko, I.A.Petel'guzov, V.V.Chekin (A.M. Gorki State Univ., Kharkov, Ukrainian SSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1143-9 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The Mossbauer effect in the ^{57}Fe nuclei at 4.2, 80 and 290K was used to identify iron-bearing phases in zirconium-rich Zr-Fe-Me alloys (Me=Sn, V, Cr, Mo, Nb, Ta) and also in Zr-Fe alloys subjected to various heat treatments. The concentrations of Fe and Me were 1 wt.% each. In the case of the Zr-Fe system the majority of the iron atoms formed the Zr_2Fe phase, whereas in Zr-Fe-V and Zr-Fe-Cr most of the atoms were in $Zr(Fe,V)_2$ and $Zr(Fe,Cr)_2$ mixed phases; the dominant phases in Zr-Fe-Mo were $(Zr,Mo)_2Fe$ and $(Zr,Mo)Fe_2$, in Zr-Fe-Nb they were $(Zr,Nb)_2Fe$ and $(Zr,Nb)Fe_2$, and in Zr-Fe-Ta there was one dominant phase $(Zr,Ta)Fe_2$. The influence of the third element on the local environment of the iron atoms in zirconium was attributed to the characteristic features of the process of crystallization of binary and ternary zirconium-base alloys. (18 refs.) *A.T.*

102783 Mossbauer spectroscopic study of the magnetic relaxation in tris(β-diketonato)iron(III) complexes. S.Yamauchi, Y.Sakai, H.Nishioji, T.Tominaga (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.7, p.977-9 (July 1983).
Mossbauer spectra of eleven kinds of tris (β-diketonato)iron(III) complexes were measured in order to investigate the magnetic relaxation effects. A correlation was observed between the Mossbauer line shape (linewidth) and the average iron-iron distance in crystals, mainly arising from the spin-spin relaxation. The dependency of line shape on temperature was also studied to check the contribution of the spin-lattice interaction. (14 refs.)

102784 Preparation, magnetic and Mossbauer resonance investigation of some perovskite-type oxides containing iridium +V. M.Walewski (Ecole Polyech. de Gdansk, Gdansk, Poland), B.Buffat, G.Demazeau, F.Wagner, M.Pouchard, P.Hagenmuller.
Mater. Res. Bull. (USA), vol.18, no.7, p.881-7 (July 1983).
New Ir(+V) perovskites of formula $MLaMgIrO_6$ (M=Ca, Sr, Ba) have been prepared under high oxygen pressure. The stabilization of Ir(+V) thanks to competition between Ir-O and Mg-O bonds is discussed and compared to that observed for La_2LiIrO_6. Magnetic and Mossbauer resonance measurements allow one to characterize iridium in the materials, which contain some Ir(+IV). (9 refs.)

102785 Lattice instability and γ-recoil effects in HfV_2 lattice. H.C.Jain, M.A.A.Saad (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.419-21 (25 July 1983).
The phenomenon of hysteresis and a temperature-dependent electric field gradient at the cubic Hf site have been observed in the superconducting cubic Laves phase (C15) compound HfV_2 which shows lattice instability below 120K. These observations suggest the presence of γ-recoil effects and fluctuating microdomains in the cubic phase of this compound above 120K. (8 refs.)

102786 A Mossbauer study of potassium ferric alum. J.M.Roberts (Dept. of Phys., Univ. of Exeter, Exeter, England).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.428-30 (25 July 1983).
The first temperature-dependent Mossbauer spectra from polycrystalline samples of KFe alum are presented. The FWHM varies considerably with temperature. Application of isotropic relaxation theory suggests that the variation is caused by a change in electron relaxation time due to competition between spin-spin and spin-lattice relaxation processes. (10 refs.)

102787 Spectral distribution of Mossbauer radiation in the presence of non-stationary lattice relaxation processes. A.Gupta (Dept. of Phys., Univ. of Indore, Indore, India).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.431-4 (25 July 1983).
A general expression for the spectral distribution of gamma-rays emitted from nuclei in bound systems has been derived which is applicable even in the presence of non-stationary relaxation processes associated with atomic motion. The expression has been used to calculate the effect of a relaxing thermal spike on the Mossbauer spectral shape. (11 refs.)

102788 Gamma quantum resonance scattering in crystals being irradiated by a laser wave. V.G.Baryshevsky (Dept. of Phys., V.I. Lenin State Univ., Minsk, Belorussian SSR).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.439-42 (25 July 1983).
It is shown that a laser wave can essentially modify the absorption length of a γ quantum being resonantly scattered by crystal nuclei. (9 refs.)

102789 Mossbauer and DTA studies of the crystallisation of borosilicate glasses. T.Nishida, T.Hirai, Y.Takashima (Dept. of Chem., Kyushu Univ., Fukuoka, Japan).
Phys. & Chem. Glasses (GB), vol.25, no.5, p.113-6 (Oct. 1983).
Continuous decreases in quadrupole splitting for Fe^{3+} were observed by isothermal annealing of a series of borosilicate glasses denoted by xR_2O, $100-x(B_2O_3, SiO_2)$, $7Fe_2O_3$, in which R denotes Na, K, Rb, or Cs, at temperatures below the individual glass transition temperatures. The decrease is ascribed to an increased symmetry around Fe^{3+} caused by the diffusion of alkali metal ions and rearrangement of oxygen atoms. Activation energies concerned with the decrease in the quadrupole splitting were found to increase in the order Cs, Rb, K, Na when the alkali content of the glasses was constant. The increase is ascribed to an increasing electrostatic force between the alkali metal ion and the oxygen atom with decreasing ionic radius of the alkali metal ion. It was also found that the activation energies increased with increasing alkali content, and this is ascribed to an increasing fraction of nonbridging oxygens in the glasses. Decreases in quadrupole splitting and linewidth (FWHM) were also observed by isothermal annealing experiments at temperatures above the glass transition temperature. The decrease is attributed to a rearrangement of network formers such as B, Si, and Fe as well as of the oxygens and the alkali metal ions. (12 refs.)

102790 Magnetic properties and hyperfine interactions in concentrated Fe-Ag alloys. C.L.Chien, K.M.Unruh (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1214-18 (1 Aug. 1983).
Fe and Ag, mutually insoluble in both the liquid state and the solid-state, are two elemental with no previously known alloys and compounds. Using a vapor-quench technique, the authors have fabricated, for the first time, noncrystalline, concentrated Fe-Ag alloys. The first measurements of the magnetic properties and hyperfine interactions of Fe-Ag in the solid state are reported. The successful fabrication of these alloys suggests that the vapor-quench method can be used to form other previously inaccessible alloys based on mutually insoluble components. (19 refs.)

102791 Formation of two-impurity complex in dilute alloys observed through perturbed angular correlations of γ rays. A.Z.Hrynkiewicz, K.Krolas (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Phys. Rev. B (USA), vol.28, no.4, p.1864-9 (15 Aug. 1983).
Interaction between two soluble impurities in metal hosts leads to a nonrandom distribution of the impurity atoms among the lattice sites. The number of the nearest-neighbor impurity-impurity pairs is discussed. It is shown how both the binding energy and the entropy of formation can be extracted for the two-impurity complex from the number of these complexes measured as a function of temperature. The method is illustrated by the perturbed-angular-correlation experiment with ^{111}In in dilute alloys of Cu, Ag, and Au with Pt impurity. The entropy of formation found for the In-Pt pair in Cu, Ag, and Au hosts agrees very well with the number of ways in which the pair can be formed in the FCC lattice. The In and Pt impurities are bound, with the binding energy depending significantly on the host. (12 refs.)

102792 Next-nearest neighbour effects in the Mossbauer spectra of Cr-spinels: An application of partial quadrupole splittings. G.M.Bancroft, M.D.Osborne, M.E.Fleet (Depts. of Chem. & Geology, Univ. of Western Ontario, London, Ontario, Canada).
Solid State Commun. (USA), vol.47, no.8, p.623-5 (Aug. 1983).
Mossbauer spectra of $Fe(Cr,Al)_2O_4$ spinels are reported and interpreted using partial quadrupole splitting theory. Fe^{2+} T site quadrupole splittings are calculated for different next-nearest neighbour configurations. Assuming random distribution of the Cr^{3+} and Al^{3+} in the octahedral M sites, good semiquantitative agreement between calculated and observed quadrupole splittings and absorption intensities is obtained. (18 refs.)

102793 ^{151}Eu Mossbauer studies on graphite-$EuCl_3$. P.Boolchand, G.Lemon, W.Bresser, D.McDaniel (Univ. of Cincinnati, Cincinnati, OH, USA), R.E.Heinz, P.C.Eklund, E.Stumpp, G.Nietfeld.
Intercalated Graphite. Proceedings of a Symposium, Boston, MA, USA, 1-3 Nov. 1982 (New York, USA: North-Holland 1983), p.393-6
^{151}Eu Mossbauer experiments on $EuCl_3$-$AlCl_3$ graphite flakes and HOPG samples have been performed as a function of temperature in the range $4.2K<T<300K$ and indicate the presence of a narrow line characteristic of Eu^{3+}. No evidence of Eu^{2+} was found. This suggests that enhanced conductivity of graphite upon intercalation with rare earth chlorides derives from a transfer of charge to the co-intercalated Cl. 76.90 OTHER TOPICS IN MAGNETIC RESONANCES AND RELAXATION

(inc. muon probe studies)

102794 Muons and muonium in solids. A.M.Stoneham (Theoretical Phys. Div., AERE, Harwell, England).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.449-59 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A muon is a very special probe of solids, since its spin polarisation can be monitored to define its behaviour in the solid: the site it occupies, the local magnetic field it experiences, and the time-dependence of the local field. The muon is a sensitive, robust and (since resonance is exploited) accurate probe. If its application has left many ambiguities of interpretation, these have usefully eliminated complacency from several areas of solid-state studies. The author surveys how muons can be exploited both as a probe of the host solid and as a unique analogue of hydrogen in topics as varied as spin glasses, phase transitions and quantum diffusion. (26 refs.)

102795 Muon trapping and Knight shift at a dilute structural defect in zinc. F.N.Gygax, A.Hintermann, W.Ruegg, A.Schenck, W.Studer, A.J.van der Wal (Lab. of High Energy Phys., Swiss Inst. for Nuclear Res., Villigen, Switzerland), H.Wehr.
Phys. Rev. Lett. (USA), vol.51, no.6, p.505-8 (8 Aug. 1983).
The interaction of a light hydrogen isotope with a structural defect is traced by means of the temperature dependence of the muon Knight shift K_μ in the HCP metal Zn. A surprising result is the huge and negative K_μ (-520 ppm) at the defect site, probably a multivacancy cluster. (13 refs.)

77.00 DIELECTRIC PROPERTIES AND MATERIALS

(for conductivity phenomena, see 72.20 and 72.80)

77.20 PERMITTIVITY

102796 Correlation of changes in the electrical conduction and dielectric constant in naphthalene due to magneto-electret formation. A.K.Bhatnagar, M.L.Khare, C.S.Bhatnagar (Dept. of Phys., MA Coll. of Technol., Bhopal, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.365-7 (June 1983).
Electrical conductivity of naphthalene is measured at different voltages before and after its magneto-electret formation. It is observed that electrical conduction decreases by 5-20%, depending on the forming parameters of magneto-electret. The variation of percentage decrease in electrical conduction with forming temperature closely follows the variation of percentage increase in dielectric constant with the forming temperature. An attempt is made to correlate the two phenomena. (6 refs.)

102797 Dielectric dispersion and dynamics near the transition temperature in crystalline ammonium hydrogen bischloroacetate. R.Jakubas, H.A.Kolidziej (Inst. Chem., Uniwersytet Wroclawski, Wroclaw, Poland), S.Sorriso.
J. Phys. C (GB), vol.16, no.21, p.L761-5 (30 July 1983).
Dielectric permittivity and losses measurements were carried out on crystalline ammonium hydrogen bis-chloroacetate in the frequency range 100-2000 MHz near the transition temperature. The observed dielectric relaxation process was nearly monodispersive. From the analysis of the various experimental results it is suggested that the most probable model of the transition observed in this crystal is the so-called pseudo-spin lattice coupled model given by Nath and co-workers (1979). (13 refs.)

102798 Enhancement of the dielectric constant near a percolation threshold. D.Wilkinson, J.S.Langer, P.N.Sen (Schlumberger-Doll Res. Center, Ridgefield, CT, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1081-7 (15 July 1983).
When one of the components of a mixture of two materials is a conductor, geometrical effects can lead to a dielectric constant for the mixture which is much greater than that of either constituent. Here the authors illustrate a simple example of this effect in a two-dimensional network consisting of randomly placed conductors and capacitors. The dielectric enhancement is obtained as a function of frequency and the concentration of conductors. The calculational technique used is the position-space renormalization group in which smaller units are combined iteratively to form larger units. (19 refs.)

102799 Improved wideband coaxial methods for dielectric measurements on nitrogen ceramics. A.B.Ahmad.
Univ. Durham, England thesis, March 1983
Two methods of measuring the dielectric properties of materials—matched termination and coaxial line resonance—have been developed and used to study the properties of two groups of nitrogen ceramics, namely, silicon nitrides and oxynitride glasses. In these methods advantage is taken of the wide frequency range, from 500 MHz up to about 9 GHz, covered by a single apparatus—the General Radio slotted coaxial line. The silicon nitride ceramics were in various degrees of nitridation given by the weight gain which ranged from 38% for partially-nitrided to a maximum of 63.2% for the fully-nitrided samples. The dielectric constant at 1 GHz increased from 4.51 for fully-nitrided to about 9.9 for the 38% weight gain samples. The fully-nitrided material has a loss factor of 7.6×10^{-3}; this increased to 1.85×10^{-1} as the weight gain decreased to 38%. These values have been extrapolated to 'zero weight gain' and compared with pure silicon for which the dielectric constant is 11.7 and the loss factor approximately 0.2. The oxynitrides have dielectric constants between 6.5 and 7.5 depending on the cation present and the percentage of nitrogen substituted for oxygen in the glasses. ϵ' increased in the cation order Mg, Y, Ca and increased with increasing nitrogen substitution in each cation series. The loss factor, however, depends not only on these cation types but also on the other constituents of the glasses.

77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

102800 'Ionic polarization' in real FCC alkali halide crystals. I. Analysis of ionic polarization on the basis of three-positional Lidiard's model. J.Pozniak (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.21-9 (July 1983).
The ionic polarization denotes the polarization induced by a DC electric field related to thermally stimulated jumps of free charge carriers in ionic crystals. The calculations were performed on the basis of the rate equations for the three-positional Lidiard's model in which the probability of thermally stimulated jumps of ions and vacancies in terms of jump frequencies and the potential barriers separating the individual positions were considered. The solutions obtained point to the formation of a space charge. In further steps the density of the isothermal depolarization current and thermally stimulated ionic current density ITC were calculated. As the expressions obtained are applicable to any charge carrier one should expect that their contribution to the ionic conductivity during polarization would give rise to the appearance of appropriate ITC peaks. (10 refs.)

102801 The electret effect in water vapour condensates and phase transformation in ice. J.Chrzanowski, B.Sujak (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.107-13 (July 1983).
A correlation between the known phase transformations of ice cryocondensates and the generation of surface charges during condensation process of water vapour onto a cold substrate is discussed. The main source of the observed electret effect seems to be a low temperature polarization process of the molecular dipoles. Local changes of the dielectric permittivity associated with the first order phase transformations may affect the experimentally observed electret effect. (25 refs.)

102802 Electrical properties of polystyrene doped with leucomalachite green for correlation with its electrothermographic behaviour. P.K.C.Pillai, A.K.Gupta (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.397-9 (Aug. 1983).
The aim of the authors' work is to gain a better insight into the process of the electrothermographic behaviour of doped polystyrene (PS) films. Leucomalachite green (LMG)-doped films of PS form a good electrothermographic system where electrostatic image formation takes place by heat dissipation of electrical charges on corona charged surfaces. In addition to thermal sensitization on doping, significant changes in the electrical properties of PS have been observed. (6 refs.)

102803 Forces and torques acting on plane and cylindrical electrets in slot-effect transducers. A.Abazi, O.D.Jefimenko (Phys. Dept., West Virginia Univ., Morgantown, WV, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4076-82 (July 1983).
A theoretical discussion of forces and torques acting on electrets in slot-effect transducers of plane and cylindrical geometry is presented. Both bipolar and monopolar electrets are considered. The electrets are assumed to carry arbitrary internal and surface charges. The dependence of forces and torques on the magnitude and location of the charges and on other electret parameters is analyzed. (8 refs.)

102804 Thermally stimulated currents in polymers driven by temperature gradients. J.Sworakowski, M.T.Figueiredo, G.F.Leal Ferreira, M.Campos (Dept. de Fisica e Ciencia dos Materiais, Univ. de Sao Paulo, Sao Carlos, Sao Paulo, Brazil).
J. Appl. Phys. (USA), vol.54, no.8, p.4523-30 (Aug. 1983).
Nonisothermal currents were measured in poly(methyl methacrylate) and poly(tetrafluoroethylene) samples, not polarized with external fields before the measurements. The currents were attributed to thermally stimulated reorientation of dipoles driven by temperature gradients across the samples. Calculations, based on a model put forward in the paper, are shown to satisfactorily reproduce basic features of the experimental curves. It is suggested that the room temperature peak in poly (tetrafluoroethylene) is due to a pyroelectric effect and is associated with a reorientation of impurity dipoles during the phase transition. (28 refs.)

102805 Field due to a dipole in a polarisable molecular lattice. R.W.Munn, I.Eisenstein (Dept. of Chem., Univ. of Manchester Inst. of Technol., Manchester, England).
J. Phys. A (GB), vol.16, no.12, p.2853-9 (21 Aug. 1983).
The effective electric field due to a permanent dipole in an arbitrary Bravais lattice of polarisable non-polar molecules is expressed exactly, taking account of the different polarisability of the polar guest molecule. The asymptotic behaviour of the field at large distances from the dipole is evaluated. An interpretation is offered for the rescaled dipole moment required to give agreement with continuum dielectric theory. (20 refs.)

102806 Theoretical analysis of the dipole polarization and depolarization in Me^{++}-doped NaCl-type alkali halide crystals. II. Next-nearest neighbour approach. J.Pozniak (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wroclaw, Poland), G.Berg.
Phys. Status Solidi a (Germany), vol.78, no.1, p.69-76 (16 July 1983).
For pt.I see ibid., vol.38, p.115 (1976). A theoretical analysis of the relaxation processes of the dipoles is made on the basis of the classic Lidiard model (1955) assuming the presence of both nn and nnn dipoles in the crystal lattice. The calculated ITC curves distinctly change with the polarizing field intensity. At strong polarizing fields ($E_p \geq 10^6$ V cm^{-1}) the ITC curves are composed of two peaks while at weak fields ($E_p \leq 10^5$ V cm^{-1}) only one peak exists, however, even in the latter cases the shape of the ITC curve at the low-temperature side somewhat differs from that obtained for nn dipoles only. The concentration of ordered (by the polarizing electric field) nnn dipoles decrease with increasing temperature. The decay of the nn dipoles is preceded by a less or more distinct concentration raise. This effect suggests that a part of the nnn dipoles undergoes disorientation changes into oriented nn dipoles. (25 refs.)

102807 Microwave dielectric echoes in Na β-alumina. M.Von Schickfus (Max-Planck-Inst. fur Festkoperforschung, Stuttgart, Germany), U.Strom.
Phys. Rev. B (USA), vol.28, no.2, p.1068-75 (15 July 1983).
Microwave dielectric echoes have been observed in Na β-alumina at temperatures between 18 and 75 mK. The results provide further evidence for the existence of low-energy two-level tunneling systems (TLS). The TLS electric dipole moment p and density of states $\bar{P}$ were determined to be $p=4.8\pm0.8$ D and $\bar{P}=1.15\times10^{32}$ erg^{-1} cm^{-3}, respectively. The nonexponential time-dependent echo decay provides evidence for spectral diffusion. Previously proposed models incorporating spectral diffusion processes in echo decay are shown to approximate the observed time-decay rates at a given temperature. However, the observed dependence of the echo decay on temperature was much weaker than predicted by spectral diffusion models. (25 refs.)

102808 Electrical and dielectric properties of poly(vinylbutyral). III. Effect of iodine doping on thermally stimulated discharge behavior. P.C.Mehendru, S.Chand, N.Kumar (Nat. Phys. Lab., New Delhi, India).
Thin Solid Films (Switzerland), vol.105, no.2, p.103-6 (15 July 1983).
For pt.II see ibid., vol.70, p.7 (1980). The depolarization behaviour of poly(vinylbutyral)(PVB) (with three degrees of polymerization) was studied as a function of iodine concentration using the thermally stimulated discharge technique. Two relaxation peaks were observed in pure as well as in iodine-doped PVB films. However, the peak temperatures, peak currents, charges and activation energies associated with these peaks decrease continuously with increasing iodine concentration. These effects of iodine on the two relaxations are explained on the basis of the formation of charge transfer complexes. (14 refs.)

77.40 DIELECTRIC LOSS AND RELAXATION

102809 Dielectric relaxation studies in pure lutidines at different microwave frequencies. O.Vir Singh (Dept. of Phys., Univ. of Jammu, Jammu, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.339-43 (June 1983).
Dielectric constant (ϵ') and dielectric loss (ϵ'') have been determined for pure 2, 4-, 2, 6- and 3, 5-lutidines at frequencies 720 kHz, 6.118, 9.8 and 19.22 GHz for four different temperatures. Dielectric relaxation time (τ) and the distribution parameter (α) have been evaluated by Cole-Cole arc plots obtained at temperatures 20, 30, 40 and 50°C. It is observed that α decreases with the increase of temperature for 2, 4- and 2, 6-lutidines. On the contrary it increases for 3, 5-lutidine with temperature. Various thermodynamic parameter have been evaluated by considering the relaxation as a chemical rate process. (19 refs.)

102810 Dielectric relaxation & molecular motion in highly viscous medium. A.Singh, A.Rastogi, S.K.Saxena, J.P.Shukla, M.C.Saxena (Dept. of Phys., Lucknow Univ., Lucknow, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.344-8 (June 1983).
Dielectric measurements have been made on some rigid polar molecules in dilute solutions of paraffin oil and benzene mixture at 9.8 GHz microwave frequency and over a temperature range of 298-322K. The relaxation behaviour has been resolved using the dielectric data by applying the methods of Higasi (1966), and Higasi, et al. (1971). The high value of the distribution parameter obtained for these systems indicates the possibility of hindered motion in highly viscous media. The flexible behaviour of these solutes has been interpreted in terms of recoiling and consequent trapping of the solute molecules between the solvent holes. The hindered motion observed in highly viscous medium in the case of the investigated rigid molecules exhibits good agreement with the earlier study of G.A. Balogun and C.W.N. Cumper [J. Chem. Soc. Faraday Trans II (GB), 69 (1973) 1172]. (10 refs.)

102811 Compensation temperature in low density polyethylene β and γ relaxations as determined by thermally stimulated depolarization measurements. D.Ronarc'h, P.Audren, S.Haridoss, J.Herrou (CENT, Lannion, France).
J. Appl. Phys. (USA), vol.54, no.8, p.4439-45 (Aug. 1983).
A thermally stimulated depolarization current technique has been used to deduce the compensation law in low density polyethylene β and γ relaxations. The linear relationship between the activation energy and the logarithm of the preexponential factor of the relaxation time has been discussed in terms of compensation temperature and variation of the thermal expansion coefficient through the β and γ processes. (36 refs.)

102812 Kinetic Ising model for polymer dynamics: applications to dielectric relaxation and dynamic depolarized light scattering. J.L.Skinner (Dept. of Chem., Columbia Univ., New York, NY, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1955-64 (15 Aug. 1983).
The author introduces a new one-dimensional kinetic Ising model to study the cooperative dynamics of linear chain molecules. Correlation functions for the model are calculated approximately. He discusses the connection between these correlation functions and certain relaxation functions that can be measured by dielectric and dynamic depolarized light scattering experiments. These relaxation functions are extremely well represented by the Williams-Watts empirical function $\phi(t)=\exp[-(t/\tau)^{\beta}]$ with β between 1/2 and 3/4. This is in reasonable agreement with both dielectric and light scattering experiments on amorphous polymers. Our results lead to a microscopic interpretation of this 'universal' nonexponential decay function. (55 refs.)

102813 Dielectric and electromechanical properties of calcium-doped lead zirconate titanate. A.Tawfik (Phys. Dept., Tanta Univ., Tanta, Egypt), A.I.Eatah, F.Abd El-Salam.
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.145-9 (Aug. 1983).
The dielectric and piezoelectric properties of calcium-doped lead zirconate titanate compounds were studied. For compounds with calcium concentrations higher than 0.05 at.% the measured properties showed a marked change in their behaviour. The results are explained on the basis of the role played by lattice defects and their interactions with the doped ions. From experimental results, the most useful composition for industrial work is lead zirconate titanate ceramic containing 0.05 at.% Ca. (10 refs.)

102814 Dielectric relaxation behaviour of some complexed species—a modified equation for relaxation times. M.Chauhan, M.Gupta, J.P.Shukla (Phys. Dept., Lucknow Univ., Lucknow, India).
Phys. & Chem. Liq. (GB), vol.13, no.1, p.47-54 (1983).
Dielectric relaxation behaviour of four rigid substances and their complexes were investigated at microwave frequency of 9.8 GHz and at varying temperatures. A modified equation for calculating apparent relaxation time of complexed species having short range interactions was suggested. The apparent relaxation time values so calculated were compared with the experimentally observed values of the complex systems. A good agreement has been reached for the systems having nearly negligible distribution, exhibiting a Debye type dispersion. (16 refs.)

77.50 DIELECTRIC BREAKDOWN AND SPACE-CHARGE EFFECTS

102815 Thermal dielectric breakdown with cylindrical electrodes. B.L.Beers (Beers Associates Inc., Reston, VA, USA), J.J.O'Dwyer.
J. Appl. Phys. (USA), vol.54, no.7, p.4083-6 (July 1983).
Solutions to the equations of thermal breakdown are computed for cylindrical electrodes with different boundary conditions. The development of the electric field and the temperature distributions are followed as functions of time, consequent on the application of a constant interelectrode voltage. The implications for possible breakdown by modes other than thermal are briefly discussed. (3 refs.)

102816 Suppression of dielectric breakdown in MgO crystals at high temperatures by impurity doping. K.L.Tsang (Dept. of Phys., Univ. of Alabama, Birmingham, AL, USA), Y.Chen.
J. Appl. Phys. (USA), vol.54, no.8, p.4531-5 (Aug. 1983).
The effect of impurities and their concentrations on the dielectric breakdown of MgO crystals at 1473 K is studied using an electric field of 1500 V/cm. Crystals doped with H, Cu, Co, Fe, Ni, Cr, or V are used. The current behavior and the characteristic time for breakdown, but the presence of Fe, Ni, Cr, or V enhances it. The suppression or enhancement of the breakdown depends on the dopant concentration. (17 refs.)

102817 Study of breakdown fields of oxides grown on reactive ion etched silicon surface: improvement of breakdown limits by oxidation of the surface. N.Lifshitz (Bell Labs., Murray Hill, NJ, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1549-50 (July 1983).
The oxide breakdown field is known to be low if the silicon surface prior to oxidation was treated by reactive ion etching (RIE) in Cl_2 or other ambient with high Si etching rate. It is believed that the early breakdown is due to poor morphology of Si surface, viz. pores and spikes caused by RIE and associated inhomogeneities of the electric field in the oxides grown on such surface. A method to upgrade the oxide to a device quality is suggested. The method consists in growth of a thin sacrificial oxide and its chemical removal prior to gate oxidation. For example, with the sacrificial oxide as thin as 180 Å, this process results in improving the breakdown field from 4 to approximately 6 MV/cm. Growth of sacrificial oxide about 600 Å thick yields a breakdown field as high as that of oxides grown on virgin silicon wafers. (5 refs.)

77.55 DIELECTRIC THIN FILMS

102818 Conduction and dielectric polarization in neodymium fluoride thin films. V.S.Dharmadhikari (Dept. of Electrical & Computer Engng., Univ. of New Mexico, Albuquerque, NM, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4087-92 (July 1983).
Measurements are reported on the capacitance, loss tangent, and permittivity of vacuum-deposited films of neodymium fluoride in the frequency range 0.050-100 kHz, thickness range 400-900 nm, and over a wide temperature range extending from 80-400K. A detailed examination of these results reveals the contribution of dipolar orientation polarization to the dielectric dispersion. It is shown, based on the modified Debye theory, that the observed relaxation is a true dielectric dispersion phenomena resulting from the orientation of dipoles. The dipoles are shown to arise from a fluorine deficiency within the film. The density of equivalent dipoles estimated is about 10^{20} cm^{-3}. The activation energy for this relaxation process is determined to be 1.02 eV. The physical and chemical nature of the deposited films is characterized by X-ray diffraction and X-ray photoelectron spectroscopy. (28 refs.)

102819 Dielectric breakdown study of thin La_2O_3 films. A.Singh (Dept. de Phys., Univ. Laval, Quebec, Canada).
Thin Solid Films (Switzerland), vol.105, no.2, p.163-8 (15 July 1983).
The dielectric breakdown in La_2O_3 films of thickness 40-400 Å incorporated in capacitors is reported. The experimental results were analysed in the light of the theory of ionization avalanche breakdown. The dielectric breakdown strength was found to be a power function of thickness, varying as $d^{-0.66}$. Furthermore, these films are amorphous and have high breakdown fields (about 10 MV cm^{-1}). 77.60 PIEZOELECTRICITY AND ELECTROSTRICTION

(for piezo-optical effects, see 78.20H)

102820 High electric field poling of electroded poly(vinylidene fluoride) at room temperature. T.T.Wang, H.von Seggern (Bell Labs., Murray Hill, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4602-4 (Aug. 1983).
Room temperature electrode poling is by far the simplest and the most convenient way of preparing piezoelectric films of poly(vinylidene fluoride) PVF_2. A shortcoming of this poling technique is, however, the relatively low electric field (<3.5 MV/cm) that can be applied to the film without incurring instantaneous flashover or arcing around the film edge. The authors demonstrate that by simply adding a rubber O ring and a plastic plate to the regular electrode poling setup, it is possible to pole biaxially oriented PVF_2 films with fields up to about 9 MV/cm for at least 5 s without incidence of breakdowns. The piezoelectric e_{31} coefficient of the poled film rises sharply with increasing field but, after reaching a value of about 21 mC/m^2(d_{31}=7.5 pC/N) t 2.5 MV/cm, it levels off gradually to a value of about 31 mC/m^2(d_{31}=11 pC/N) at fields above 6 MV/cm. (13 refs.)

102821 Stability of PZT type piezoelectric ceramics under fast uniaxial stress. H.Ohanessian, P.Gonnard, M.Troccaz, L.Eyraud, P.Eyraud (Lab. de Genie Electrique et Ferroelectricite, Inst. Nat. des Sci. Appliquees, Villeurbanne, France).
Rev. Phys. Appl. (France), vol.18, no.8, p.479-86 (Aug. 1983). In French.
The purpose of the paper is the characterisation of lead zirconate titanate piezoelectric ceramics suitable for reversible impact-striking applications. Energy-measurements and stability tests under various pulse-width impacts were achieved; it is found that the main parameters are the following: the stability is a decreasing function of the pulse-width; efficiency and stability of the material depend on the vacancy-state and electric balance of this composition, as also on the Zr/Ti ratio. (10 refs.)

102822 Influence of anion impurities and X-rays on the piezoelectric effect in ammonium dihydrogen phosphate crystals. A.M.Shikin (N.P. Ogarev State Univ., Moscow, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.73-4 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.123-5 (Jan.-Feb. 1983).
Gives the results of an investigation of the piezoeletric properties of ADP crystals in the temperature interval 293-403K. The piezoelectric effect in ADP crystals depends on the addition of doping (controllable) impurities, is topographically distributed by volume, and is enhanced by the action of X-rays. (10 refs.)

102823 Linear equations of state for electrically polarized ceramics. B.A.Kudryavtsev (Inst. of Chem. Machinery Construction, Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.954-6 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.610-14 (Nov. 1982).
Calculations for piezoelements made from electrically polarized ceramics are carried out using the linear theory of electroelasticity for a piezoelectric medium having symmetry ∞m. In this case it is assumed that the elastic and electric properties of the polarized ceramic are described by the same matrices of elastic, piezoelectric, and dielectric constants that apply to piezoelectric crystals of the class 6 mm. When the electrical polarization is taken into account the linear equations of state of a piezoceramic differ from the corresponding equations for a piezoelectric medium. (7 refs.)

77.70 PYROELECTRIC AND ELECTROCALORIC EFFECTS

102824 Pulse amplitude method for determining the pyroelectric coefficient of pyroelectric materials. A.J.Tuzzolino (Lab. for Astrophys. & Space Res., Univ. of Chicago, Chicago, IL, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.505-16 (1 July 1983).
A simple amplitude method of measuring the pyroelectric coefficient of pyroelectric materials is described. Intense, short-duration (0.4 μs) light pulses generated by a semiconductor laser diode are absorbed at one surface of a thermally insulated sample of pyroelectric material, resulting in thermal pulses in the sample. The time and amplitude characteristics of the resulting charge pulses from the sample are measured using electronics of the type used with semiconductor charged-particle detectors. Theoretical calculations of the charge pulse shapes expected from samples having various assumed volume polarisation distributions and measured charge rise times are used to determine optimum time constants for the pulse shaping electronics. These techniques are applied to a number of pyroelectric samples of polyvinylidene fluoride and lithium tantalate with thickness in the range 9 μm to 1 mm, and area of 0.07 cm^2 and 0.28 cm^2. The absolute pyroelectric coefficient of the sample is obtained directly from the measured amplitude distribution of the charge pulses, the measured sample reflectivity, and the photon and electronic calibrations for the system. In addition, useful information regarding the polarisation distribution in the sample is directly obtained during measurements. (35 refs.)

102825 Currents generated in pyroelectrics by γ irradiation. B.A.Levin.
Sov. At. Energy (USA), vol.53, no.6, p.863-5 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.401-2 (Dec. 1982).
The author has investigated the individual components of the short-circuit current $I_{s.c.}$ or the charge generated in ferroelectric ceramics ZTP-19 (Zr-Ti-Pb), $BaTiO_3$, and a single crystal of $LiNbO_3$ under continuous and pulsed gamma irradiation at dose rates $W_\gamma=16\text{-}3\times10^8$ R/sec (1 R=2.58×10^{-4} C/kg). The author studied the effect of the input parameters of the pyroelectrics and of the irradiation conditions on the photovoltaic current and other components of the short-circuit current. For W_γ=16-600 R/sec the author used an arrangement with ^{60}Co, and for $W_\gamma=10^3\text{-}4\times10^8$ R/sec studied the effect of a single pulse of γ radiation of 2-3 msec duration at the IIN and 'Hydra' reactors. 77.80 FERROELECTRICITY AND ANTIFERROELECTRICITY

102826 Effect of CuO addition on the electrical and dielectrical properties of semiconducting barium titanate ceramics. M.Kuwabara (Kyushu Inst. of Technol., Kitakyushu, Japan).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.403-6 (Aug. 1983).
Both the electrical and the dielectrical properties of porous semiconducting barium titanate ceramics with grain boundaries consecutively insulated by the addition of CuO have been investigated in the light of the relationship between the resistivity-temperature and the dielectric constant-temperature characteristics. The feature of a consecutive change in the resistivity-temperature characteristics from the one for the PTCR (positive temperature coefficient of resistivity) material to that for the GBBL (grain boundary barrier layer) material was made clear. The result indicates that the electrical property of the GBBL material is an extreme case of that of the PTCR material, and that the dielectric constant-temperature characteristics of the materials with intermediately insulated grain boundaries yield two-step PTCR properties. The present experiments may suggest that controlling the texture of the ceramic material should be considered for producing the GBBL materials with prominent electrical and dielectrical properties. (12 refs.)

102827 Ferroelectric polymers. A.J.Lovinger (Plastics Res. & Dev. Dept., Bell Labs., Murray Hill, NJ, USA).
Science (USA), vol.220, no.4602, p.1115-21 (10 June 1983).
Piezoelectricity and pyroelectricity, traditionally encountered in certain single crystals and ceramics, have now also been documented in a number of polymers. Recently, one such polymer—poly(vinylidene fluoride)—and some of its copolymers have been shown to be ferroelectric as well. The extraordinary molecular and supermolecular structural requirements for ferroelectric behavior in polymers are discussed in detail, with particular emphasis on poly(vinylidene fluoride). Piezoelectric, pyroelectric, and ferroelectric properties are also briefly reviewed, as are some promising applications of such polymers. (39 refs.)

77.80B Transitions and Curie point

102828 The influence of radiation defects on the nonlinear properties of TGS in the neighbourhood of the temperature of ferroelectric transition. Z.Pretczynski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warszawa, Poland).
J. Tech. Phys. (Poland), vol.23, no.2, p.111-18 (1982).
Experimental studies of the properties of TGS suggest that imperfections of the test piece (crystal lattice defects internal stresses) influence the coefficients *A* and *B* of expansion of the thermodynamic potential, therefore the objective of the work reported was to study the influence of crystal lattice defects, introduced purposely, on the nonlinear properties of TGS in the neighbourhood of the temperature of phase transition. (7 refs.)

102829 Proton tunnelling in KH_2PO_4. R.Blinc, B.Zeks (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia), R.J.Nelmes.
Phase Transitions (GB), vol.3, no.4, p.293-308 (1983).
The spectroscopic and crystallographic evidence for a symmetric (single-minimum) versus a double-minimum type O-H-O potential in KH_2PO_4-type crystals is reviewed. The results clearly show that both the protons in KH_2PO_4 and the deuterons in KD_2PO_4 move between two off-centre sites and freeze onto one of these two sites below the ferroelectric transition temperature T_c. A self-consistent determination of the proton-tunnelling frequency from the observed soft-mode frequency, and other static and dynamic properties, requires the use of the four-particle cluster model as the short-range correlations of the protons around a given PO_4 group cannot be neglected. The pressure and temperature-dependence of the proton-tunnelling frequency can be understood on the basis of some very general properties of the O-H-O potential. (27 refs.)

102830 Dielectric and nonlinear optical properties of new nonstoichiometric phases of tetragonal tungsten bronze containing lead and thorium. J.Ravez, A.Simon, P.Hagenmuller (Univ. de Bordeaux I, Talence, France), J.Thoret, W.Freundlich, H.Le Person.
Rev. Chim. Miner. (France), vol.20, no.3, p.404-10 (1983). In French.
The thorium-lead substitution in $Pb_{2.50}Nb_5O_{15}$ and $Pb_2KNb_5O_{15}$ has allowed the authors to prepare new phases with tetragonal tungsten bronze structure. These compounds are piezoelectric, have a coupled ferroelastic-ferroelectric behavior and are characterized by a second harmonic generation. Replace-

ment of lead by thorium is responsible of a decrease of the spontaneous strain, the ferroelectric Curie temperature and the harmonic yield. (12 refs.)

77.80D Domain structure and effects; hysteresis

102831 Three dimensional constitutive relations for ferroelectric materials in the presence of quasi-static domain switching. P.J.Chen (Sandia Nat. Labs., Albuquerque, NM, USA).
Acta Mech. (Austria), vol.48, no.1-2, p.31-42 (1983).
The author proposes three dimensional constitutive relations for the stress and the electric displacement for ferroelectric materials taking into account the changing material properties which occur during quasi-static domain switching. These constitutive relations are characterized for the ceramic PZT 65/35 via experimental results entailing acoustic, electromechanical and electrical measurements. The author also establishes the correspondence of these constitutive relations to the standard relations in the literature which describes the responses of poled ferroelectric materials in the absence of domain switching. (6 refs.)

102832 The influence of foreign ions impurities on the dielectric properties of TGS-like crystals. J.Stankowska (Inst. of Phys., Adam Mickiewicz Univ., Poznan, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.115-22 (July 1983).
Triglycine sulphate and selenate crystals, pure as well as admixtured with foreign ions (Cu^{2+}, Cr^{3+}, Fe^{3+}) are studied. The impurities are found to induce a change in the dielectric properties of the crystals. Particularly, they generate a fine and fixed domain structure, prolong the aging time, lower the permittivity and spontaneous polarization and increase the coercive field; also, they cause a slight decrease in Curie temperature. Temperature measurements of coercive field E_c at various frequencies of the measuring field indicate that the activation energy of P_s increases with increasing amount of impurity and decreases with increasing temperature, being all the time considerably smaller in deuterated triglycine sulphate crystals (DTGS) than in TGS crystals. (17 refs.)

102833 Heterogeneous states with ferroelectric soliton-fluctuons. I.I.Cherkashenin, V.E.Yurkevich, B.N.Rolov (Dept. of Theoretical Phys., Latvian State Univ., Riga, Latvian SSR).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.245-53 (1983).
The paper considers a Hamiltonian of crystal fluctuations as a functional of three kinds of fields, i.e. ordering field, a field corresponding to the distribution of solitons and a field connected with the distribution of coupled electron-fluctuon systems. A thermodynamic potential of soliton-fluctuon system was analysed and the fluctuation theory of this system was developed elsewhere. The paper analyses basic kinetic equations describing the process of domain wall motion within the framework of the given model. (17 refs.)

102834 Scanning electron microscopic investigations of peculiarities of the $BaTiO_3$ ferroelectric domain contrast. V.V.Aristov (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR), L.D.Kokhanchik, K.-P.Meyer, H.Blumtritt.
Phys. Status Solidi a (Germany), vol.78, no.1, p.229-36 (16 July 1983).
Possibilities and conditions for SEM observations on barium titanate domain structures are discussed. The optimum conditions to observe domains of the samples with no conducting layer are those providing a positive charge on the surface. The samples under study are examined in the secondary electron mode at 2 to 4 kV. Under these conditions the electron microscopic contrast of the domains of different types is found to arise due to the potential effects. The mechanism of the formation of the potential contrast in $BaTiO_3$ is proposed and discussed. The charge accumulated on the surface at electron bombardment is considered to mainly cause the appearance of such a contrast, the latter being determined by the anisotropy of dielectric permittivity and different conduction in various sites of the sample. (14 refs.)

78.20D Optical constants and parameters

102835 Optical properties of ferromagnetic alloy $Fe_{81}Si_{12}B_7$ in amorphous and crystalline states. Yu.V.Knyazev, G.A.Bolotin, A.P.Potapov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1107-11 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the optical properties of ferromagnetic alloy $Fe_{81}Si_{12}B_7$ in amorphous and crystalline states in the wavelength range 0.22-21 μm at room temperature. The process of amorphisation of this alloy altered considerably the optical constants as well as the plasma and relaxation frequencies of conduction electrons, and it also modified the spectral profile of the frequency dispersion of the optical conductivity. An analysis was made of the reasons for these anomalies. (7 refs.) *A.T.*

102836 Optical properties of a-Si and a-Si:H prepared by DC magnetron techniques. D.R.McKenzie, N.Savvides, R.C.McPhedran (School of Phys., Univ. of Sydney, Sydney, NSW, Australia), L.C.Botten, R.P.Netterfield.
J. Phys. C (GB), vol.16, no.24, p.4933-44 (30 Aug. 1983).
The authors investigate the optical properties of amorphous silicon and hydrogenated amorphous silicon films prepared by DC magnetron reactive sputtering and by glow-discharge techniques. Optical constants n and k are determined for six films over the wavelength range 0.4-2.5 μm (photon energy range 0.5-3.1 eV) and are used to obtain the optical band gaps, density-of-states constant, and the width of the Urbach tail of the bands. The authors investigate the effect of a small percentage of metal additives on the optical properties of the materials, and the effect of heat treatment on hydrogenated material. (23 refs.)

102837 Angle-of-incidence derivatives of the complex parallel and perpendicular reflection coefficients and their ratio for a film-substrate system. R.M.A.Azzam (Dept. of Electrical Engng., Univ. of New Orleans, Lakefront, New Orleans, LA, USA).
Opt. Acta (GB), vol.30, no.8, p.1113-24 (Aug. 1983).
Angle-of-incidence derivatives of the complex parallel (p) and perpendicular (s) reflection coefficients R_p and R_s, and their ratio $\rho=R_p/R_s$, for an absorbing substrate coated by a transparent film are investigated as functions of the angle of incidence ϕ and film thickness d. Such derivatives are of importance to AIDE*R* (angle-of-incidence derivative ellipsometry and reflectometry). R'_p/R_p, R'_s/R_s and ρ'/ρ (where the prime indicates $\partial/\partial\phi$) are shown to be aperiodic spiral functions of d at constant ϕ, except in the limiting cases of normal and grazing incidence when they become periodic. In the latter case ($\phi=90°$), the locus of R'_ν/R_ν (ν=p or s) is found and proved to be exactly a circle. The complementary family of constant-thickness contours of these derivative functions are also plotted in the complex plane. Finally, graphs representing the real AIDE*R* signals $\mathcal{R}'_p/\mathcal{R}_p$, ψ' and Δ' (where $\mathcal{R}=|R|^2$, $\tan\psi \exp(j\Delta)=\rho$) versus d at constant ϕ, and versus ϕ at constant d, are given. (10 refs.)

102838 Temperature dependence of the index ellipsoid of Rochelle salt over the 4.2-318K range. N.A.Romanyuk, V.M.Gaba, A.M.Kostetskii.
Opt. & Spectrosc. (USA), vol.54, no.1, p.106-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.186-9 (Jan. 1983).
Reports a study of the temperature and spectral changes in the index ellipsoid of Rochelle salt crystals over essentially the entire temperature range in which the crystal exists (4.2-318K). The results reveal qualitatively new information on the properties of Rochelle salt crystals: (a) the appearance of an isotropic direction along the crystallography X axis and (b) the sizes of the temperature and spectral regions in which this direction exists. (10 refs.)

102839 Time-resolved reflectivity measurements in silicon [with reply]. M.Combescot, J.Bok (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France), C.V.Shank, R.Yen, C.Hirlimann.
Phys. Rev. Lett. (USA), vol.51, no.6, p.519-20 (8 Aug. 1983).
In a recent Letter (see ibid., vol.50, p.454, 1983), Shank, Yen, and Hirlimann (SYH) report experiments on time-resolved reflectivity of laser-irradiated silicon using femtosecond pulses. Combescot and Bok show that SYH have overestimated by one order of magnitude the value of the density of electron-hole pairs produced in their experiments, and that their conclusion on the absence of Auger recombination is thus incorrect. They believe that these experiments give a good evidence for plasma-assisted melting. In reply SYH state that the attempts by Combescot and Bok to interpret the experimental results as a verification of their theory of plasma-assisted melting are not on a firm basis. A new, more accurate method of determining the plasma density under conditions of high excitation is required. (5 refs.)

102840 Description of coloration and discoloration processes in inorganic photochromic materials. T.Kaczor (Tech. Univ., Radom, Poland), S.Nowak, J.Zmija.
Phys. Status Solidi a (Germany), vol.78, no.1, p.187-92 (16 July 1983).
A description of photochromic processes with regard to self-acting discoloration mechanisms is presented. Mathematical formulations on the time-dependent number of filled active states in photochromic processes are introduced and their boundary values are discussed. Changes of the absorption coefficient of photochromic materials during radiation based on relations obtained are defined. (3 refs.)

102841 Calculation of optical properties of semiconductors with the use of simple orbitals. A.-B.Chen, S.Phokachaipatana (Auburn Univ., Auburn, AL, USA), A.Sher.
Phys. Rev. B (USA), vol.28, no.2, p.1121-3 (15 July 1983).
To assess the applicability of a simple-orbital method to the optical properties of disordered semiconductor alloys, the reflectivity spectra of GaAs, GaP, and InP have been calculated. With a flexibility to adjust the band energies and effective masses, this methods produced spectra compared favourably with experiments and more sophisticated calculations. (16 refs.)

102842 Optical electron transitions in a two-dimensional disordered semiconductor. V.L.Bonch-Bruevich, To Tkhi Bik Nguet (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.994-6 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.22-4 (Nov. 1982).
The frequency dependence of the light absorption coefficient associated with electron transitions between strong and weak localization is studied. (5 refs.)

102843 Intermediate order and interband optical absorption. V.D.Iskra (Acad. of Agriculture, Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1005-10 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.35-41 (Nov. 1982).
Based on simple model concepts, taking into account the presence of intermediate order, the frequency dependence of the light absorption coefficient is determined in the region of the optical tail, formed by the 'intrinsic' random field of an amorphous semiconductor. (20 refs.)

102844 Investigation of the refractive index profiles of multilayer $Ga_{1-x}Al_xAs$ laser heterostructures. O.V.Bogdankevich, A.N.Georgobiani, V.G.Solin, P.A.Todua (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.240-1 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.426-7 (Feb. 1983).
The method of spatial modulation of the reflection of light from a cleaved section was used to find the refractive index profiles of three- and four-layer $Ga_{1-x}Al_xAs$ laser heterostructures (with GaAs substrates). The dependences of the concentration of Al in $Ga_{1-x}Al_xAs$ solid solutions and of the band gap on the coordinate perpendicular to the plane of growth were calculated. A spatial resolution of $\sim 0.4\ \mu$ was achieved, the sensitivity in the determination of the gradient of the refractive index $\sim 10^{-4}\ \mu^{-1}$, and the absolute error in the measurement of the layer thicknesses was $\sim 0.05\ \mu$ (for layer more than $0.4\ \mu$ thick). (3 refs.)

102845 Effect of thermoradiation treatment on the radiation stability of glasses. G.I.Ikramov, I.Kh.Isaev, A.N.Kononov, G.T.Petrovskii, D.M.Yudin (S.I. Vavilov State Optical Inst., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.317-19 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.462-4 (July-Aug. 1982). [received: May 1983]
Using thermoradiation treatment it is possible to change not only the radiation-optical properties of glasses but also their transparency. The latter is of great practical interest in connection with the development of fiber optics and of importance for increasing the transparency of the materials in use. (3 refs.)

78.20F Birefringence

(inc. stress birefringence, flow birefringence, etc)

102846 Investigation of the birefringence of natural alkali-halide crystals with the help of interference of polarized rays. A.Kh.Zil'bershtein.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1189-91 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.641-4 (Oct. 1982).
The most accurate methods for the determination of birefringence are interference methods. The transmission spectrum of a birefracting transparent crystalline plate positioned between parallel polarizers so that the azimuth of the cross section being analyzed of the optical indicatrix of the crystal makes an angle of $\pi/4$ with the principal plane of the polarizers (a 45-degree orientation) is the interference pattern of the polarized rays. Such an interferogram permits determining the birefringence spectrum of the crystal from the spectral position of the interference fringes when the crystal thickness (in the direction of light propagation) and the corresponding interference orders (k) are known. In the general case the determination of k presents appreciable difficulties. However, for crystals with weak birefringence Δn (i.e. under the condition $|\Delta n| l < \lambda^m$, where λ^m is the shortest wavelength of light in the spectral interval being investigated and l is the crystal thickness) it is evident that $|k| < 1$ for the entire range. The authors consider a method for the determination of this weak birefringence. (6 refs.)

102847 Photoelastic constants of calcite from its first-order Raman spectrum. G.Swarna Kumari, N.Rajeswara Rao (Dept. of Phys., Osmania Univ., Hyderabad, India).
Phys. Rev. B (USA), vol.28, no.4, p.2172-82 (15 Aug. 1983).
A formalism to connect photoelastic constants and Raman intensities of a crystal is developed. The internal coordinates of the crystal are related to the strains and the polarizability derivatives are obtained from Raman intensities and expressions are derived for photoelastic constants of calcite. With Raman intensities taken from the spectra taken by Kondilenko et al. (Opt. Spectrosc. 40, 402, 1976), the photoelastic constants are evaluated. They compare favorably with the experimental values determined by Pockel and recently by Nelson and his colleagues (1970, 1971, 1972). The constants thus evaluated form a 9×9 matrix as the internal coordinates are related to displacement gradients μ_{ij} in accordance with Nelson's ideas. As a result of the fact that calcite has only one line in its A_{1g} species, the ratio $(P_{11}+P_{12})/P_{13}$ is found to be independent of the refractive index or Raman intensities of the crystal; the ratio evaluated is 1.007, which may be compared with 1.332 obtained from Pockel's values and with 1.124 from the work of Nelson and collaborators. The ratio P_{13}/P_{33} is dependent entirely on the intensities of A_{1g} line in the *yy* and *zz* spectra: the authors obtained 2.147, as compared with 1.838 of Pockel's and 2.074 of Nelson and collaborators' experimental values. (27 refs.)

102848 Study of photoelastic properties of films of styrene-butadiene ternary block copolymers. V.S.Skazka, A.E.Ruchin, A.D.Vilesov, S.Ya.Frenkel'.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1525-9 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The temperature dependence of photoelastic coefficient ϵ has been studied for films of ternary styrene-butadiene block copolymer obtained from toluene solutions and from solutions in two selective solvents. The essential increase of ϵ in the region of T_g of PS is explained by the effect of the shape of PS domains in the lattice of block copolymer. The following enhancement of temperature results in decrease of ϵ related to melting of the supercrystalline lattice. Annealing and long storage of annealed films at room temperature leads to decrease of the influence of the effect of the shape of PS domains of ϵ. The time dependences of ϵ point out the existence of two relaxational processes in polybutadiene matrix and PS domains. (6 refs.)

102849 Method of the study of diamagnetic anisotropy of polypropylene fibers. S.I.Fedotov, Yu.V.Zelenev, I.P.Fedotov, Yu.A.Volkov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1555-7 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The results of the study of birefringence are compared with the data about the diamagnetic anisotropy of PP fibers. The values of birefringence and of refractive index calculated from the diamagnetic anisotropy are in better agreement with experimental data, than the values of these characteristics calculated from the values of polarizabilities of -C-C- bonds. 78.20H Piezo-, elasto- and acousto-optical effects

102850 Mutarotation of glucose solution under ultrasonic irradiation. B.V.Gurunadha Rao, V.P.Bhatnagar, S.B.Agarwal (Dept. of Phys., Delhi Coll. of Engng., Delhi, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.349-51 (June 1983).
Mutarotation of fresh and equilibrium solutions of glucose have been studied under irradiation of ultrasonic waves of 1.5 MHz. The process of mutarotation has been found to be accelerated under ultrasonic exposure. Further, a marked decrease in the optical rotation was noted in case of equilibrium solution. This effect increased with the exposure time to ultrasonic waves and attained a saturation. The time-constant by which the glucose solution attained its new equilibrium value was found to depend on ultrasonic power. The observed effect indicates that the structural state of the glucose can be changed by ultrasonic irradiation. (6 refs.)

102851 Piezoreflection of mechanically free natural graphite crystals after an impact load. A.Kh.Zilbershtein.
Opt. & Spectrosc. (USA), vol.54, no.1, p.72-4 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.127-31 (Jan. 1983).
It is shown that anisotropy of light reflection from the (0001) plane of mechanically free natural graphite crystals after an impact load X in the 100-300-kbar range is caused by piezoreflection induced by residual mechanical stresses X_{11}. It was found that the influence of cracks and twins on the degree of anisotropy was small. The magnitudes of residual stresses in these crystals were evaluated. The linear dependence of the reflection anisotropy of

the (0001) plane of graphite on $\rho_0^{1/2}$ (ρ_0 is the density of cracks) was observed, which allowed the authors to assume the existence of a linear dependence of residual uniaxial stress on the applied stress in the studied range of loads. The proportionality coefficient for graphite deformed along $[1\bar{1}00]$ was $X/X_{11} \simeq (1.5\text{-}0.5) \times 10^3$. (13 refs.)

102852 Acoustooptical effect in a nematic liquid-crystal layer in an ultrasonic field. N.K.Gus'kov, E.N.Kozhevnikov (State Univ., Kuibyshev, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.21-4 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.38-43 (Jan.-Feb. 1983).
It is shown that for normal incidence of an ultrasonic beam on a nematic liquid-crystal layer the sound field rotates the molecules of the crystal and clears the layer within the boundaries of the ultrasonic beam. The results of the calculations are compared with experiment. (15 refs.)

78.20J Electro-optical effects

102853 Electroreflectance study of π-adsorption. A.B.Ershler, A.M.Funtikov, I.M.Levinson.
Sov. Electrochem. (USA), vol.18, no.11, p.1410-15 (Nov. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.11, p.1577-82 (Nov. 1982).
Aromatic hydrocarbons when undergoing adsorption take up a position parallel to the surface of mercury electrodes. In this orientation they do not affect electric double layer capacity and the amount adsorbed is weakly potential-dependent. Such is the situation when the electrode is charged positively. At small negative surface charge densities this parallel orientation changes to 'perpendicular'. Here the adsorption behavior is the same as found for aliphatic compounds. In the planar orientation the molecules are presumed to form a complex with the positively charged electrode, more precisely a charge transfer complex (CTC) where the electrode functions as the electron acceptor. This is indicated by the negative displacement of the potential of zero charge following adsorption of aromatic compounds in a planar orientation. Evidently the highest occupied π-orbital of the aromatic molecules is involved in CTC formation, hence the term, π-adsorption (one should not speak about the π-orbital but about a narrow surface band arising upon CTC adsorption on the metal). It is the aim of the work to detect adsorbate-electrode CTC by electroreflectance. (16 refs.)

78.20L Magneto-optical effects

102854 Magnetooptic effects in diffuse reflection of light. G.S.Grinchik, L.V.Nikitin, O.V.Kasatkina.
Opt. & Spectrosc. (USA), vol.54, no.1, p.75-6 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.132-5 (Jan. 1983).
The magnetooptic effect is measured for the first time on a diffusely reflecting finely divided ferromagnet. It is discovered that the equatorial Kerr effect in diffuse reflection from finely divided structures of nickel is increased approximately by an order of magnitude, and its dependence on the frequency and angle of incidence of the light is changed. The results were successfully explained on the basis of the assumption that the magnetooptic constants of nickel are maintained, and the optical characteristics of the surface are subject to the Maxwell-Garnette equations. (5 refs.)

102855 Magneto-optical studies of atomic thallium centers in KCl: Magnetic circular dichroism tagged by spin resonance. F.J.Ahlers, F.Lohse, J.M.Spaeth (Experimentalphys., Univ. Gesamthochschule Paderborn, Paderborn, Germany), L.F.Mollenauer.
Phys. Rev. B (USA), vol.28, no.3, p.1249-55 (1 Aug. 1983).
The authors report measurement of the magnetic circular dichroism (MCD) of radiation-damaged crystals of KCl doped with Tl. By using microwaves resonant with ground-state magnetic splittings, they have been able to tag such MCD spectra to specific species. In particular, they have shown that bands peaking at 1040, 725, 550, 405, 340, and 254 nm all belong to the $Tl^0(1)$ center, where that center, as determined by earlier spin-resonance studies, consists of a neutral Tl atom perturbed by the field of an adjacent anion vacancy. The experiment constitutes the first direct evidence that a recently discovered, thallium-associated, laser-active center whose pump band peaks at 1040 nm is indeed the $Tl^0(1)$ center; furthermore, the MCD of the two lowest energy bands are in rough quantitative agreement with predictions of a simple electronic model of that center. Finally, the technique has allowed the discovery of two other centers having distinctly different spin resonances, yet whose optical spectra bear some striking similarities to that of the $Tl^0(1)$ center. Because their fundamental bands overlap those of the $Tl^0(1)$ center, the new centers may affect the operation of $Tl^0(1)$-center lasers. (10 refs.)

102856 Magneto-optical response of f- and d-states in uraniummonosulfide. W.Reim, J.Schoenes, O.Vogt (Lab. fur Festkorperphys., ETH Zurich, Zurich, Switzerland).
Solid State Commun. (USA), vol.47, no.8, p.597-601 (Aug. 1983).
High field magnetooptic Kerr-rotation and -ellipticity measurements in the energy range between 0.55 and 5.1 eV are reported for a 5f-metal for the first time. The remarkable size of the magneto-optical response is explained with the large overlap of f- and d-orbitals and the enhanced spin-orbit energies in heavy atoms. The diagonal as well as the off-diagonal conductivity is discussed in a microscopic model. The authors obtain a conduction band occupancy of 1.1 d-electrons per uranium ion with a negative spin-polarization of -42%. The spin-polarization of the F-electrons is found to be 62%. (25 refs.)

102857 Effect of multiple reradiations on the shape of the magnetic depolarization contour. III. The influence of the Faraday effect. V.P.Afanas'ev (Moscow Power Inst., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1018-21 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.50-3 (Nov. 1982).
For pt.II see Izv. VUZ Fiz. (USSR), no.12, p.30-5 (1976). The effect of anomalous dispersion on the transfer of polarized resonance radiation in the presence of a magnetic field is theoretically investigated. The magnetic rotation of the plane of polarization is studied under unusual Faraday-effect conditions of small optical thicknesses ($\tau \simeq 1\text{-}10$) and weak magnetic fields ($H \simeq 10\text{-}100$ Oe). It is shown that the angle of rotation of the plane of polarization can take negative values. The results of numerical calculations are presented in the form of graphs. The results obtained are compared with experiments. (10 refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

102858 Raman scattering of light off magnetically doped superconductors. Xiong Shijie, Cai Jianhua (Inst. of Solid State Phys., Nanjing Univ., Nanjing, China).
Chin. Phys. (USA), vol.3, no.2, p.473-83 (April-June 1983).
Raman scattering of light off magnetically doped superconductors is theoretically investigated, in cases both of absence and presence of magnetic order. In the former case, the authors have solved an integral equation for the four-vertex function to obtain a general expression for the scattering efficiency relative to the normal state, and in the latter case, they have studied the influence of spin excitations on the relative scattering efficiency. (6 refs.)

102859 The dependence of SERS on the vibrational mode, exciting radiation and applied potential. M.L.A.Temperini, W.J.Barreto, O.Sala (Inst. de Quimica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.148-52 (29 July 1983).
The surface-enhanced Raman spectra of 4-methylpyridine adsorbed on a silver electrode were investigated. A ratio of intensities, given by the intensity of each Raman band divided by the sum of the intensities of all the bands in the same spectrum, was defined in order to cancel out the surface concentration effect. This ratio was plotted versus applied potential and exciting radiation for several vibrational modes. The representation so obtained shows more clearly the modulation produced in the SERS by the molecular vibrations, as compared with the usual Raman intensity representation. The results are tentatively interpreted on the basis of a charge-transfer mechanism. (18 refs.)

102860 Spectral detail in liquid acetonitrile at far-infrared frequencies. G.J.Evans (Edward Davies Chem. Lab., Univ. Coll. of Wales, Aberystwyth, Wales).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.173-6 (29 July 1983).
The existence of spectral detail in the far-infrared absorption spectrum of a polar, associated liquid (CH_3CN) is reported. The details are resolved on the low-frequency side of the spectral profile. A tunable far-infrared laser system suggests that the detail is not completely resolved at the 4 cm^{-1} resolution used in the interferometric study. It is proposed that the origin of the detail resides in the cooperative motion of molecules in this liquid. (17 refs.)

102861 Enhancement by polar solute of interaction-induced IR absorption in liquid CS_2. S.Weiss, U.Dinur (Dept. of Chem., Ben Gurion Univ., Beer-Sheva, Israel).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.197-200 (5 Aug. 1983).
The enhancement of the 'forbidden' infrared absorption in the ν_1, symmetric stretch, band of CS_2 by small concentrations of CH_3CN, was studied both experimentally and via MC simulation. (11 refs.)

102862 A quantitative analysis of the ν_s(IR) bands of H-bonds. II. Adipic acid crystals. Y.Marechal (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
Chem. Phys. (Netherlands), vol.79, no.1, p.85-94 (15 Aug. 1983).
For pt.I see ibid., vol.79, no.1, p.69-83 (1983). The theory described in the preceding article is applied to the ν_s bands (X-H...Y) of adipic (H and D) acid monocrystals. The lineshape $g(\omega)$ that ν_s is supposed to exhibit in the absence of Fermi resonances is computed at temperatures ranging from 10 to 300K. This lineshape has at least two components in the case of H-adipic acid which the author preferentially attributes to the ν_s-ν_s interaction (≈ 100 cm^{-1}) between the two H-bonds of the cyclic dimers $(RCOOH)_2$. The author cannot however exclude that these two components are due to a tunnelling of the protons through the H-bonds of these dimers. The precise determination of the second centered moments (or width) of $g(\omega)$ at various temperatures gives results which are consistent with the value of the first moment and can be simply accounted for with the assumption that the modulation of ν_s by low-frequency modes is quadratic. The question as to whether this low-frequency mode is a stetching mode or a bending mode in an isolated H-bond remains unanswered. (18 refs.)

102863 Intrinsic infrared absorption of halide glasses. H.B.Rosenstock, L.L.Boyer (Naval Res. Lab., Washington, DC, USA).
Glass Technol. (GB), vol.24, no.3, p.168-9 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
A scheme has been developed for calculating the 'intrinsic' infrared absorption of multicomponent halide glasses. The model used emphasises the interaction of the phonons; it is, therefore, based on an interaction potential (the so-called Morse potential) that is essentially (rather than secondarily) anharmonic, yet exactly solvable. (12 refs.)

102864 Electronic spectra of complexes of neodymium (III) and praseodymium (III) with amino acid. M.P.Bhutra, A.K.Gupta (Dept. of Phys., Univ. of Jodhpur, Jodhpur, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.374-5 (June 1983).
The electronic spectra of complexes of praseodymium (III) and neodymium (III) with amino glycine, alanine and valine have been recorded in the 360-920 nm region in water. The energies and intensities of various transitions calculated using the Judd-Ofelt relation are in good agreement with those obtained experimentally. (15 refs.)

102865 On the optical properties of trans-polyacetylene. H.Eckhardt (Allied Corp. Corporate Technol., Morristown, NJ, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2085-6 (15 Aug. 1983).
The optical properties of trans-polyacetylene are of fundamental importance in understanding the electronic structure of this conjugated polymer and they have been extensively studied in the past few years. One of the most emphasized results is the contrasting behavior of trans and cis polyacetylene; the trans isomer showing a broad unstructured band and the cis isomer showing significant vibrational structure in both transmission and reflection spectroscopy. The author shows that, with careful control of the cis-to-trans isomerization conditions, the trans spectrum does contain vibrational structure and the spectra produced in previous work are dominated by effects due to chemical and structural disorder. He suggests that the present evidence is now overwhelming that the lowest energy optical peak in trans-$(CH)_x$ is excitonic in origin. The author presents specular reflection data from free standing cis- and trans-$(CH)_x$ films and compare these spectra with transmission spectra from thin $(CH)_x$ films. (12 refs.)

102866 A classic example of an Evans hole caused by intermolecular interaction in solid $2ND_3.D_2O$ at 15 to 145K. J.E.Bertie, J.P.Devlin (Dept. of Chem., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Chem. Phys. (USA), vol.79, no.4, p.2092-3 (15 Aug. 1983).
It has recently been noted that a sharp dip at 2333 cm^{-1} in the higher-frequency, infrared, O-D stretching band of $2ND_3.D_2O$ at 100K may be an Evans hole. In a study of the infrared spectra of the isotopic species $2NA_3.B_2O$, where A and B are independently H or D, the authors confirmed this possibility with evidence that is so unusually complete that they report it here separate from the main body of their results. (12 refs.)

102867 Infrared characterization of α- and β-crystalline silicon nitride. J.P.Luongo (Bell Labs., Murray Hill, NJ, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1560-2 (July 1983).
Silicon nitride, Si_3N_4, used as a passivating layer in microelectronics, exists in the crystalline forms α-Si_3N_4 and β-Si_3N_4, and as amorphous material. Although the two crystalline modifications differ only slightly in their structure, it has been found that each modification can be distinguished by infrared spectroscopy. The spectral characteristics of α-and β-Si_3N_4 are described and a method for determining the concentration of one phase in the presence of the other has been developed. (10 refs.)

102868 Resonance inverse Raman spectroscopic study of proflavin-DNA intercalation. Tsuey Ing Chen, M.D.Morris (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2314-17 (23 June 1983).
Resonance inverse Raman spectroscopy is used to probe the proflavin-DNA complex. Raman hypochromism to about 30-40% of the initial intensity is observed for most bands of proflavin upon complexation. However, the 1485-cm^{-1} band is only attenuated to 80% of its intensity in the absence of DNA. This band is assigned to Wilson 19 a mode of the central ring of the acridinium system. From the slight attenuation of this band it is inferred that intercalation disturbs the electronic distribution on the outer rings more strongly than on the central ring. (35 refs.)

102869 Raman scattering study of the structural phase transitions in $RbAlF_4$. A.Bulou, M.Rousseau, J.Nouet (Lab. de Phys. de l'Etat Condense, Univ. du Maine, Le Mans, France), P.L.Loyzance, R.Mokhlisse, M.Couzi.
J. Phys. C (GB), vol.16, no.23, p.4527-37 (20 Aug. 1983).
A Raman scattering study of the non-ferroic and of the improper ferroelastic structural phase transitions (SPT) in the perovskite-type layer compound $RbAlF_4$ is reported. It is shown that the SPT occurring at $T_{c1}=551K$ $(D_{4h}{}^1 \rightleftharpoons D_{4h}{}^5)$ and at $T_{c2}=282K$ $(D_{4h}{}^5 \rightleftharpoons D_{2h}{}^{13})$ are related to displacive mechanisms owing to the occurrence of one and two soft phonons below T_{c1} and T_{c2} respectively. The results are consistent with a first-order character for the SPT at T_{c1}, and a second-order character for that at T_{c2}. Moreover, in the tetragonal $D_{4h}{}^1$ and $D_{4h}{}^5$ phases, the Raman spectra exhibit a number of features which cannot be explained by the selection rules at $q=0$. In particular, one of these additional lines exhibits a soft-mode behaviour above the T_{c2} transition, while the condensing phonon is a zone-boundary mode. Such features are imputed to the loss of translational symmetry caused by the existence of intrinsic structural disorder. (12 refs.)

102870 Asymmetry of the lineshape in one-magnon Raman scattering from FeF_2. S.R.P.Smith, M.G.Cottam, J.Ariai, D.H.Coule (Dept. of Phys., Univ. of Essex, Colchester, England).
J. Phys. C (GB), vol.16, no.23, p.4701-17 (20 Aug. 1983).
Presents measurements of the one-magnon Raman scattering spectrum from antiferromagnetic FeF_2, which show a temperature-dependent asymmetric lineshape with a pronounced tail on the high-frequency side. The degree of asymmetry, and also the overall linewidth, increase with temperature over the temperature range studied (up to ${}^1/{}_2T_N$, where $T_N=78K$). It is shown that the mechanism responsible for the linewidth is the scattering of a magnon by the disorder at finite temperatures in the longitudinal spin components. This gives rise to a damping $\Gamma(\omega)$ that is frequency dependent, and hence a lineshape that is asymmetrical. A good empirical description of the lineshape is obtained using a high-density perturbation expansion method. The theoretical estimates of the linewidth are smaller than the experimental values, and we discuss how these estimates may be affected by the presence of optic magnon modes. (26 refs.)

102871 IR-spectral study of vanadate vitreous systems. Y.Dimitriev, V.Dimitrov (Higher Inst. of Chem. Technol., Sofia, Bulgaria), M.Arnaudov, D.Topalov.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.147-56 (Aug. 1983).
Some structural conclusions have been reached concerning vanadate glasses according to the influence of the M^{n+}-ions on the vibrations of the isolated V-O-bonds and the location of the bands in the IR-spectra. They may shift with the compositions or preserve their positions. Ions of predominant electrostatic interactions are distributed between the chains and the layers in the glass structure, they interact directly with the isolated V-O bonds. As a result of this the transition from VO_5 into VO_4 is achieved directly or through intermediate complexes. It is likely that ions which participate in covalent bonds fit into vanadate chains of the glass network in substitution positions. (67 refs.)

102872 Excitation of lines in the infrared spectrum of Hg_2Cl_2 crystals due to cell doubling with a phase transition. A.A.Kaplyanskii, M.F.Limonov, Yu.F.Markov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.251-4 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.212-15 (5 March 1983).
Excitation of new lines in the infrared spectra of crystals due to doubling of the unit cell accompanying a structural phase transition (for improper ferroelastics Hg_2Cl_2) is observed for the first time. The number and polarization of lines excited for $T<T_c$ coincide with the predictions of a group-theoretical analysis. The dispersion of optical branches is determined experimentally from the critical orientation $\Gamma \rightarrow X$ of the Brillouin zone of the paraelectric phase. (6 refs.)

102873 Lattice vibration spectra XXXIII. Far-infrared reflection spectra, TO and LO phonon frequencies, optical and dielectric constants, and effective charges of the spinel-type compounds MCr_2S_4 (M=Mn, Fe, Co, Zn, Cd, Hg), MCr_2Se_4 (M=Zn, Cd, Hg), and MIn_2S_4 (M=Mn, Fe, Co, Ni, Cd, Hg). H.D.Lutz, G.Waschenbach, G.Kliche, H.Haeuseler (Lab. fur Anorganische Chem., Univ. Siegen, Siegen, Germany).
J. Solid State Chem. (USA), vol.48, no.2, p.196-208 (1 July 1983).
Far-infrared reflection spectra of hot-pressed samples of the spinels MCr_2S_4 with M=Mn, Fe, Co, Zn, Cd, and Hg, MCr_2Se_4 with M=Zn, Cd, and Hg, and MIn_2S_4 with M=Mn, Fe, Co, Ni, Cd, Hg have been recorded in the range from 40 to 700 cm^{-1}. The spectra show four reststrahlen bands in the case of normal spinels and up to five in the case of inverse spinels. The transverse and longitudinal optical phonon frequencies at wave vector $|\mathbf{q}|\simeq 0$ are determined by Kramers-Kronig analysis and the classical oscillator-fit method. Effective ionic charges (normalized splitting, transverse effective charge, Szigeti charge) were calculated from the experimentally determined TO/LO splittings and from the high frequency dielectric constants. The obtained data reveal an increasing covalency of the chalcide spinels in the order selenides>sulfides, chromium compounds>indium compounds, inverse spinels>normal spinels, $NiM_2'X_4>CoM_2'X_4>FeM_2'X_4MnM_2'X_4$, $HgM_2'X_4>ZnM_2'X_4>CdM_2'X_4$. (25 refs.)

102874 Relation between mechanical properties and spectrum for chrysotile asbestos. E.P.Kraineva, V.L.Petrov, T.I.Polupanova.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1157-9 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.604-7 (Oct. 1982).
Vibrational spectroscopy can be used to establish relationships between the quality and the structural and chemical factors for one of the representatives of the serpentine minerals: chrysotile asbestos (CA). The authors have examined the IR spectra of three types of chrysotile asbestos having the same space group but differing in mechanical properties, in particular in strength: specimens of normal strength, and broken and weathered ones. The chemical formula of chrysotile is $Mg_3Si_2O_5(OH)_4$. The structure of CA resembles that of a clay mineral in being composed of polar layers. The layers are constituted by silicon-oxygen networks (chemical complex Si_2O_5) and magnesium hydroxide, and these have a tendency to buckle with the formation of cylindrical cavities of diameter up to 100 Å. The IR spectra were measured in the range 4000-200 cm^{-1}. (7 refs.)

102875 Hydrogen bonds in modified isocyanates of peat and lignite waves studied by IR spectroscopy. E.A.Yurkevich, S.V.Drozdovskaya, S.F.Aksinovich.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1166-9 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.614-18 (Oct. 1982).
The study of the nature of the bonds of isocyanates with the individual components of natural waxes found in antiadhesion lubricants is carried out in connection with the development of directed synthesis of new grades of modified waxes, due to the instability of the waxes with respect to the action of isocyanates. The use of IR spectroscopy for the analysis of the structure of modified waxes has been most effective, since the complexity of the systems prevents the use of chemical methods alone to obtain sufficient information. IR spectroscopy is also one of the best ways of observing hydrogen bonds. (9 refs.)

102876 Raman studies of $\langle P_2\rangle$ and $\langle P_4\rangle$ of some homologous nematic liquid crystals with small optical anisotropy. R.Seeliger, H.Haspeklo, F.Noack (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany).
Mol. Phys. (GB), vol.49, no.5, p.1039-63 (10 Aug. 1983).
Presents results of Raman studies of the order parameters $\langle P_2\rangle$ and $\langle P_4\rangle$ for some liquid crystalline cyanophenylcyclohexanes (PCH-3, PCH-5 and PCH-7), which, in contrast to most data available in the literature, are in remarkably close accordance with predictions by the mean-field theories for the nematic order. Measurements do not reveal a significant dependence on the molecular length. The PCHs differ from materials for which the theory is not capable of reproducing the experimental findings on $\langle P_4\rangle$, by their rather low optical and dielectrical anisotropy. In the authors' opinion, this difference seems to be the key for the solution of the $\langle P_4\rangle$ problem of the Raman scattering technique. Due to the lack of a proper theory, the influence of the anisotropic local electric field on the depolarization ratios of the Raman intensities has been neglected in the past in the formalism developed to evaluate the order parameters from the measurements. It will be shown that this disregard cannot be correct generally, with the error becoming larger with increasing anisotropy. In the light of this concept the authors' verification of the theoretical predictions is a consequence of the very small local field anisotropy in the PCH series. The magnitude of the local field effect is estimated by means of a two-dimensional model. (14 refs.)

102877 Raman study of the low-temperature dispersion of the dielectric properties of lithium tantalate. N.S.Abdullaev, V.S.Gorelik, B.S.Umarov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.70-2 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.123-6 (Jan. 1983).
The Raman-scattering spectra of $LiTaO_3$ have been studied at 5, 80, and 300K in the Y(ZZ)X scattering geometry in which transverse A_1 (T) phonons should be seen. The spectra were excited by the 514.5-nm line from an Ar laser with a power of ~0.5 W. At 5K, the spectrum reveals four transverse fundamental A_1 vibrations. In the region of the low-frequency fundamental vibration there is an additional maximum, which corresponds to a bound state. The static permittivity has been calculated for 5, 80, and 300K from the results found for the frequencies and halfwidths of the Raman lines in the quasi-harmonic approximation. Dispersion curves have been plotted for the basic dielectric properties of the crystal over the 0-900-cm^{-1} frequency range. The results agree satisfactorily with direct measurements in the IR part of the spectrum. (7 refs.)

102878 Low-temperature electronic absorption spectra of the sodium nitrite crystal. V.P.Fedorov, V.A.Naumov, A.Ya.Korets.
Opt. & Spectrosc. (USA), vol.54, no.1, p.108-9 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.189-91 (Jan. 1983).
Reports measurements of the electronic absorption spectra of the sodium nitrite crystal in polarized light. The authors studied free and deformed samples (the latter grown in quartz cuvettes of specified thickness) at 4.2-200K. (18 refs.)

102879 Homogeneously broadened far-infrared absorption line due to the $\bar{E}\rightarrow 2\bar{A}$ transition of excited chromium ions in ruby. N.Retzer, H.Lengfellner, K.F.Renk (Inst. fur Angewandte Phys., Univ. Regensburg, Regensburg, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.487-90 (1 Aug. 1983).
By use of far-infrared laser spectroscopy, the authors have found that for a high-quality ruby crystal at low temperature, the absorption line due to the electronic transition between the excited states $\bar{E}(^2E)$ and $2\bar{A}(^2E)$ of Cr^{3+} ions is homogeneously broadened. From the linewidth (0.011 cm^{-1}) the life-

time of the 2Ā level against emission of 29 cm^{-1} phonons is obtained. (12 refs.)

102880 Infrared-active combination band in a surface formate species. B.E.Hayden, K.Prince, D.P.Woodruff, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Phys. Rev. Lett. (USA), vol.51, no.6, p.475-8 (8 Aug. 1983).
Infrared reflection-absorption spectroscopy of a formate species on Cu(110) shows not only ν_s(COO) and ν(CH) stretching modes characteristic of a bridge species but also a combination band $\nu_a(COO)+\delta(CH)$. Both components of this band have dynamic dipoles parallel to the surface and are thus forbidden themselves. Adsorbate-adsorbate dynamic dipole interactions cause the frequency to shift downwards with increasing coverage. The high absorption cross section of the band is attributed to a Fermi resonance with ν(CH). (15 refs.)

102881 Role of electromagnetic resonances in the surface-enhanced Raman effect. S.A.Lyon (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA), J.M.Worlock.
Phys. Rev. Lett. (USA), vol.51, no.7, p.593-6 (15 Aug. 1983).
The magnitude of the plasma-resonance contribution to surface-enhanced Raman scattering on silver-island films has been measured with use of an experimental arrangement in which the resonance can be suppressed. The measured reduction in Raman scattering is ~300, but theoretical analysis indicates that there may remain an additional unsuppressed factor $\lesssim 3$. The data show that plasma resonances are not essential for observation of Raman scattering by molecular monolayers using standard detection techniques. (23 refs.)

102882 Polarized IR reflectance spectra of pure and neutron irradiated Qn(TCNQ)$_2$ mosaics. K.Kamaras (Central Res. Inst. for Phys., Budapest, Hungary), R.Swietlik, A.Graja.
Phys. Status Solidi b (Germany), vol.118, no.1, p.K43-6 (1 July 1983).
In order to learn more about the change occurring at IR frequencies in conducting uniform-stack salts upon irradiation, the authors have measured the polarized reflectance spectra of oriented quinolinium $(TCNQ)_2$ mosaics in the mid-infrared region (4000 to 200 cm^{-1}), pure and irradiated to have up to 8% impurities on the TCNQ stack. (11 refs.)

102883 A simple best fit method for the far infrared reflectivity spectra by using the four-parameter semi-quantum model: application to the sodium nitrite spectrum. M.El Sherif, F.Brehat, B.Wyncke (Lab. Infrarouge Lointain, Univ. de Nancy, Nancy, France).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K47-50 (1 July 1983).
The authors have measured the low frequency reflectivity spectra (10 to 600 cm^{-1}) of $NaNO_2$ in the temperature range 30 to 500K. The electric field $\vec{E}$ of the incident light is oriented along the crystallographic axis $\vec{a}$, $\vec{b}$, and $\vec{c}$. The reflectivity curves are fitted by using a simple computer best fit program based on minimizing the difference at a limited number of test points, between the experimental (R_{exp}) and calculated (R_c) values of the reflectivity. The model chosen for the dielectric permittivity is the four-parameter semi-quantum model (F.P.S.Q.). (7 refs.)

102884 Polarization-dependent infrared reflectivity spectra of CuInSe$_2$. H.Neumann (Sektion Phys., Karl-Marz-Univ. Leipzig, Leipzig, Germany), R.D.Tomlinson, W.Kissinger, N.Avgerinos.
Phys. Status Solidi b (Germany), vol.118, no.1, p.K51-6 (1 July 1983).
The authors have measured and analysed polarization-dependent infrared reflectivity spectra on carefully oriented $CuInSe_2$ single crystals. Infrared reflectivity spectra for the polarization directs $\vec{E}\parallel\vec{c}$ and $\vec{E}\perp\vec{c}$ were measured at room temperature in the wave number range $\bar{\nu}$ of 40 to 4000 cm^{-1} using a Perkin-Elmer spectrophotometer model 58 OB at $\bar{\nu}=180$ to 4000 cm^{-1} and a single-beam spectrometer at $\bar{\nu}=40$ to 400 cm^{-1}. To determine the mode parameters the spectra were analysed in terms of a multiharmonic damped oscillator model. (12 refs.)

102885 Vibrational spectra and structure of stereoregular poly(methyl methacrylates) and of the stereocomplex. J.Dybal, J.Stokr, B.Schneider (Inst. of Macromolecular Chem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Polymer (GB), vol.24, no.8, p.971-80 (Aug. 1983).
Infra-red and Raman spectra of films and solutions of syndiotactic and isotactic poly(methyl methacrylate) (PMMA) and of the stereocomplex of PMMA were measured. Vibrational bands sensitive to conformational transitions were determined. Differences of band intensities in spectra of stereoregular PMMA and of the stereocomplex indicate changes of populations of conformational forms of polymer chains accompanying stereocomplex formation. For syndiotactic PMMA in the stereocomplex, the extended chain conformation predominates. (38 refs.)

102886 Rheo-optical Fourier transform IR spectroscopy of polyurethane elastomers. I. Principle of the method and measurements at ambient temperature. H.W.Siesler (Bayer AG, Dormagen, Germany).
Polym. Bull. (Germany), vol.9, no.8-9, p.382-9 (March 1983).
Rheo-optical FTIR spectroscopy has emerged as an extremely valuable tool to study deformation phenomena in polymeric solids. With the aid of a specially designed stretching apparatus short-time spectroscopic and mechanical data can be obtained simultaneously during the deformation and relaxation of polymers. Apart from a general introduction to the principle of the technique and its application to polyurethanes the data obtained with a series of three model polyester urethanes of different hard and soft segment content at ambient temperature are discussed in terms of the segmental orientation induced during uniaxial elongation and recovery. (12 refs.)

102887 Rheo-optical fourier transform IR (FTIR) spectroscopy of polyurethane elastomers. II. Measurements at elevated temperature. H.W.Siesler (Bayer AG, Dormagen, Germany).
Polym. Bull. (Germany), vol.9, no.10-11, p.471-8 (April 1983).
For pt.I see ibid., vol.9, p.382-9 (1983). In part I the application of rheo-optical FTIR spectroscopy to a series of model polyester urethanes at ambient temperature has been discussed with reference to the phase separation and segmental orientation of these polymers during uniaxial elongation and recovery. In the present work, the results of variable-temperature FTIR measurements and rheo-optical FTIR investigations at elevated temperature are presented and interpreted in terms of the temperature dependence of hydrogen bonding and structural organization of the hard segments. (11 refs.)

102888 Rheo-optical Fourier transform IR (FTIR) spectroscopy of polyurethane elastomers. II. Investigation of NH-deuterated specimens. H.W.Siesler (Bayer AG, Dormagen, Germany).
Polym. Bull. (Germany), vol.9, no.12, p.557-62 (May 1983).
For pt.II see ibid., vol.9, p.471 (1983). Previously the results of rheo-optical FTIR investigations at ambient and elevated temperature obtained from a series of model polyester urethanes with varying composition have been discussed in terms of the phase separation and segmental orientation of these polymers. In the present work the potential is demonstrated of this technique applied to NH-deuterated specimens of these polyester urethanes with reference to a more detailed insight into phase separation and the orientation mechanism of the phase-separated hard segments during uniaxial elongation and recovery. (11 refs.)

102889 Raman scattering of pure, singly- and doubly perturbed interstitial hydrogen atom centers in alkali halides. E.Goovaerts, Z.-F.Zhou, D.Schoemaker (Phys. Dept., Univ. of Antwerp, Wilrijk-Antwerp, Belgium).
Radiat. Eff. (GB), vol.72, no.1-4, p.81-7 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Hydrogen atoms occupying interstitial tetrahedral sites are produced by UV excitation of OH^- impurities in alkali halides. A single narrow Raman line is associated with this U_2 center and polarization studies confirm the $A_1 \rightarrow T_2$ nature of the vibrational transition. In alkali halides containing also heavier halogen ion impurities, the interstitial hydrogen can be trapped next to them and a singly perturbed U_2 center of C_{3v} symmetry as well as a doubly perturbed U_2 center of C_{2v} symmetry are produced. Their identification was based on a careful analysis of polarized Raman studies on both randomly oriented and preferentially oriented centers. $RbBr:I^-, OH^-$ is a typical example: the fundamental $A_1 \rightarrow T_2$ of the pure U_2 center is at 330 cm^{-1}; the singly perturbed U_2 center yields a $A_1 \rightarrow A_1$ Raman line at 284 cm^{-1} and a $A_1 \rightarrow E$ transition at 345 cm^{-1}. The doubly perturbed center exhibits a single line at 269 cm^{-1}. A qualitative discussion of these results is attempted. (19 refs.)

102890 Raman scattering induced by V centers and their aggregates in alkali halides. L.Taurel, E.Rzepka, S.Lefrant (Lab. de Phys. Cristalline, Univ. de Paris-Sud, Orsay, France).
Radiat. Eff. (GB), vol.72, no.1-4, p.115-21 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The Raman spectroscopy technique allows one to determine the nature of stable non-paramagnetic V-centers created in KI and KBr X-irradiated in the range 100-300K. In the early stage of X-irradiation, trihalide ions X_3^- (X=I, Br) are created. They are characterized by the 111 cm^{-1} (KI) and the 175 cm^{-1} (KBr) stretching vibrational mode of the linear ion. The X_3^- ions are responsible for the V_2 (about 350 nm) optical absorption band in KI and of the V_4 (275 nm) band in KBr. By increasing the X-ray dose, polyhalide ions characterized by the I_2 vibrational mode in I_n^- (n=5,...) ions are formed. In the case of KI, it is shown that the polyiodides are precursors of iodine aggregates which have the iodine crystal structure. Studies of KI (Ca^{2+}) and KBr (Sr^{2+}) near RT proves that the X_3^- ions are stabilized by the divalent cations. (12 refs.)

102891 Reconsidering the existence of cubic sublimated P$_4$S$_{10}$. M.C.Demarcq (Lab. de Chimie Organique, Inst. Nat. des Sci. Appliquees de Lyon, Villeurbanne, France), M.Lamalle.
Rev. Chim. Miner. (France), vol.20, no.3, p.396-403 (1983).
No confirmation could be gained of the actual existence of the cubic sublimated modification of P_4S_{10}, as described by Cueilleron and Vincent (1970). Strong evidence suggests, on the contrary, that the latter could rather be a balanced mixture of amorphous P_4S_{10}+cubic P_4S_9+sulphur. (23 refs.)

102892 Raman effect in single crystal NiSO$_4$.6H$_2$O. L.S.G.Cancela, G.M.Gualberto (Inst. de Fisica, Univ. Estadual de Campinas, Campinas, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.305-14 (June 1982).
The Raman spectrum of $NiSO_4.6H_2O$ was obtained at room temperature and 77K. A theoretical study of the number, type and activity of the optical phonons in this material, permitted a classification of the observed phonons. The data showed an anomalous temperature dependence for the peak at 42 cm^{-1} with symmetry B_2 and for the peaks at 75 and 115 cm^{-1} with symmetry A_1. (10 refs.)

102893 On the nature of IR absorption peaks introduced by the absorbed hydrogen on Si surface. T.S.Shi, S.N.Sahu, J.W.Corbett (Phys. Dept., State Univ. of New York, Albany, NY, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.L289-90 (July 1983).
The authors analyse the IR peaks due to hydrogen bonds at the silicon surface. They use a model proposed earlier for the SiH vibration centers in crystalline Si based on the chemical effect of the nearest neighbor atoms on the band character and on the IR vibration frequency. (3 refs.)

102894 Optical microanalysis of small semiconductor structures. D.V.Murphy, S.R.J.Brueck (Lincoln Lab., MIT, Lexington, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.81-94
Raman spectroscopy is a powerful tool for evaluating semiconductor crystal characteristics with a diffraction-limited spatial resolution of approximately 0.5 μm, comparable to device structure dimensions. Examples are presented of the use of Raman scattering to measure stress variations across Si-on-insulator and Si-on-sapphire stripes with dimensions down to 2 μm and, to probe the spatial variation in the effectivness of annealing, of a Si layer deposited over metal device structures. Detailed measurements of the variation in the Raman spectra of thin crystalline Si films, with thicknesses down to 3.0 nm, are discussed. Measurements made on roughened Si surfaces are presented which show that surface morphology on a submicron spatial scale results in enhanced Raman intensities. (28 refs.)

102895 Raman scattering as a temperature probe for laser heating of Si. D.Kirillov, J.L.Merz (Dept. of Electrical & Computer Engng., Univ. of California, Santa Barbara, CA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.95-102
The frequency of the phonon line in the Raman scattering spectrum recorded during CW laser-beam heating of Si was used as a characteristic of the lattice temperature inside the laser spot. It is shown that Raman scattering is a good temperature probe up to the laser power approaching optical damage of Si. (16 refs.)

78.35 BRILLOUIN AND RAYLEIGH SCATTERING

102896 Anomalous backscattering of optical radiation in a stratified solution. F.V.Bunkin, M.A.Davydov, N.P.Kitaev, G.A.Lyakhov, K.F.Shipilov, T.A.Shmaonov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.178-80 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.147-9 (5 Feb. 1983).
Temperature-selective generation of a powerful pulse, initiated by seed laser radiation, is observed. The experiment is performed with a system that includes a regenerative amplifier and a cell containing the solution (water-γ-collidine), in which the scattering provided the feedback. (2 refs.)

102897 Molecular reorientation of benzene in carbon tetrachloride, tetramethylsilane and neopentane solutions. W.Hartl, H.Versmold (Phys. Chem. IIa, Univ. Dortmund, Dortmund, Germany).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1143-53 (July 1983).
The depolarized Rayleigh scattering of benzene in CCl_4, $C(CH_3)_4$ and $Si(CH_3)_4$ solutions has been investigated. Despite the similar molecular sizes polarizabilities of the solvents, the wing spectra in dilute solutions are observed to be very different. Orientational memory functions calculated from the spectra show a pronounced oscillatory pattern in the CCl_4 solutions, the pattern being much less obvious in the $C(CH_3)_4$ and $Si(CH_3)_4$ solutions. Since it is improbable that these changes are due to changes in the interaction-induced scattering, they are attributed to changes in the orientational dynamics. Following previous work on benzene, the oscillatory pattern is attributed to librational motion of the benzene molecule in the liquid. The libration persists if benzene is encaged by heavy molecules such as CCl_4, but diminishes in solutions with light molecules, such as $C(CH_3)_4$ and $Si(CH_3)_4$. (31 refs.)

102898 Determining the dimensions of light-sensitivity and color centers of silver-halide photochromic glasses from measurements of the angular characteristics of light scattering. A.V.Dotsenko, V.K.Zakharov, V.A.Loiko.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1180-5 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.630-6 (Oct. 1982).
The problem of establishing the dimensions of scattering particles on the basis of measurements of the light-scattering characteristics is a complex inverse problem which may be uniquely solved only in a number of particular cases. The solution of this problem for heterophase photochromic glasses (PCG) is of practical importance in view of the difficulties of determining the dimensions of regions of light sensitivity and color. In particular, measurements of the dimensions of regions occupied by silver-halide phase by means of an electron microscope may give distorted results because of the sensitivity of the microcrystalline phase to the electron beam. Formulas are derived for determining the dimensions of scattering particles in monodisperse and polydisperse ensembles of small homogeneous and two-layer particles. (12 refs.)

102899 Light scattering in nematic liquid crystals in non-equilibrium steady states. H.Pleiner (Univ. Essen, Essen, Germany), H.Brand.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.423 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Summary form only given, as follows. Thermal fluctuations in nematic liquid crystals about a non-equilibrium stationary state due to an external temperature gradient or due to an external shear stress are theoretically investigated. The influence of the non-equilibrium situation on the light scattering spectrum (especially on the equilibrium Lorentzian due to transverse director fluctuations) is discussed. In an external temperature gradient this Lorentzian does not alter its height, but is slightly shifted and is deformed into an asymmetric shape because of the non-equilibrium situation. With the help of a stabilizing magnetic field and by small-angle scattering, it should be possible to resolve experimentally this asymmetry. By the application of an external shear stress, the spontaneously broken rotational symmetry of nematics is broken externally, too. The equilibrium Lorentzian is (in addition to the trivial Doppler shift) flattened and broadened in a symmetric but non-Lorentzian manner due to wave-vector independent non-equilibrium contributions. This anisotropy arising from various possible directions of temperature gradient (or shear stress), director, and wave vector has a pronounced effect on the non-equilibrium contributions to the light scattering spectrum. By the non-equilibrium situation, dynamics and statics are mixed up in an intricate manner.

102900 The $o\rightleftharpoons e$ light scattering during the flow of ionic current in α-$LiIO_3$ single crystals. Xu Zhengyi, Yang Huaguang, Li Yinyuan (Inst. of Phys., Acad. Sinica, Beijing, China).
Sci. Sin. (China), vol.26, no.6, p.637-49 (June 1983).
Summarizes the phenomena of $o\rightleftharpoons e$ light scattering induced by the fluctuation of space charge during the flow of ionic current in α-$LiIO_3$ single crystals. The most noticeable features are as follows: When the incident beam is ordinary (or extraordinary) light, the scattered light is extraordinary (or ordinary) in polarization. The scattering bands extend 360° around the *c*-axis, though generally much stronger in the forward direction. The intensity distribution of scattering bands is asymmetrical with respect to the transmitted light spot. With a D-type crystal used as the specimen, the asymmetry in scattering intensity distribution is also reversed with respect to that observed in an L-type crystal. The authors point out that the nonuniformity and fluctuation of space charge lead to the variation of dielectric tensor such that its non-diagonal elements deviate from zero. Thus, the $o\rightleftharpoons e$ scattering is preliminarily understood as a radiation process of the second order. (33 refs.)

78.40 VISIBLE AND ULTRAVIOLET SPECTRA

102901 Triplet-state optical spectra of highly concentrated isotopically mixed crystals of anthracene A-h_{10}:A-d_{10}. D.Rund, H.Port (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany).
Chem. Phys. (Netherlands), vol.78, no.3, p.357-61 (1 Aug. 1983).
Photoexcitation spectroscopy with a dye laser is applied to study highly concentrated isotopically mixed crystals of anthracene A-h_{10} in the region of the $T_1 \leftarrow S_0$0-0 transition. The spectra of the seperated A-h_{10} and A-d_{10}. The spectra of:A-d_{10} subbands are measured in polarized light at 6K. The concentration-dependent intensities and energetic positions of the subbands are described quantitatively using the moment-expansion method of the mixed-crystal Green's function. (17 refs.)

102902 Urbach rule behavior in strongly absorbing fine particle solids. R.K.Waring,Jr., W.Y.Hsu (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4093-6 (July 1983).
The intrinsic absorption spectrum $\alpha(E)$ of fine particles (<0.2 μm) of $PbCrO_4$, $BiVO_4$, CdS, and ZnS, respectively, was measured in the vicinity of the visible absorption edge from 20 to 300K by diffuse reflectance. In $PbCrO_4$ and in isoelectronic $BiVO_4$, the edge is exponential and steepens, while remaining fixed in energy, as T is reduced. The edge fits the Urbach behavior: $\sigma = d\ln\alpha/dE = (2\sigma_0/\hbar\Omega_0)$ tanh $(\hbar\Omega_0/2\ k_BT)$, where σ_0 and Ω_0 are constants and $\sigma \simeq 80$ eV^{-1} at 300K. The authors find $\hbar\Omega_0 = 25\times10^{-3}$ eV in $PbCrO_4$, nearly coinciding with the 23×10^{-3} eV vibration observed in natural crocoite. For the exponential edge in single crystal CdS, $\sigma \simeq 80$ eV^{-1} at 300K and also increases at low T. However, the edge shifts to higher energy at low T. In fine particles of pure CdS, the energy shift was again found, but $\sigma \simeq 20$ eV^{-1}, independent of T. This suggests that in pigmentary CdS σ is controlled by extrinsic factors such as defects. It behaves as a compensated semiconductor in which color arises from a transition between delocalized states. ZnS behaves similarly. The intrinsic nature of edge broadening in fine particle $PbCrO_4$ and $BiVO_4$ may result from the electronically isolated nature of the chromosphore in these solids, wherein the color probably results from a charge transfer transition between localized states. (17 refs.)

102903 Spectroscopic properties of some Eu^{3+} doped scheelite-related rare earth sesquimolybdates and sesquitungstates. J.Huang, J.Loriers (Lab. d'Etude des Materiaux par Techniques Avancees, CNRS, Meudon-Bellevue, France), P.Porcher.
J. Solid State Chem. (USA), vol.48, no.3, p.333-45 (15 July 1983).
The optical properties of Eu^{3+} as a local structural probe are analyzed when incorporated in some rare earth and bismuth scheelite-related molybdates or tungstates: α-$La_2(MoO_4)_3$, $Bi_2(MoO_4)_3$, α-$Gd_2(MoO_4)_3$, and $Gd_2(WO_4)_3$. When the rare earth occupies more than one crystallographic position, the dye laser selective excitation technique is applied to determine the point symmetry of the site and to derive the energy level schemes. In α-$La_2(MoO_4)_3$, the occupation of vacant positions by Eu^{3+} is confirmed and the conditions for an enhancement of the occupation are discussed. The analogy of the α-$Gd_2(MoO_4)_3$ and $Gd_2(WO_4)_3$ spectra constitutes further evidence for their isostructural character. (28 refs.)

102904 ^{13}C isotope shifts of anthracene and naphthalene isomers in triplet state optical spectra. U.Doberer, H.Port, D.Rund, W.Tuffentsammer (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany).
Mol. Phys. (GB), vol.49, no.5, p.1167-78 (10 Aug. 1983).
Position-specific ^{13}C isotope shifts in the $T_1 \leftarrow S_0$ photoexcitation spectra of anthracene and naphthalene crystals containing ^{13}C substituted molecules in natural abundance and of material enriched with various synthesized ^{13}C isomers are compared. From the spectra of matrix isolated A-h_{10} in A-d_{10} and N-h_8 in N-d_8 the individual isotope shifts U_0 of all the ^{13}C monosubstituted isomers are determined (with values U_0 between 0.7 and 3.5 cm^{-1}). An additivity rule is established for the U_0 of the twofold substituted $^{13}C^{13}C$ isomers similar to that found for multiple deuteration. Applying these results also the ^{13}C substructure of the excitonic Davydov components in anthracene and naphthalene crystals is understood quantitatively. A correlation between the specific ^{13}C isotope shifts and the triplet state spin density distribution is discussed. (22 refs.)

102905 High-pressure optical spectra of condensed oxygen. M.Nicol (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA), K.Syassen.
Phys. Rev. B (USA), vol.28, no.3, p.1201-6 (1 Aug. 1983).
Optical-absorption spectra (1.5-3.5 eV) of the fluid and three solid phases of O_2 have been recorded up to 40 GPa near 298K. The principal feature of the spectra of the fluid and rhombohedral β-O_2 is the $2^1\Delta_g \leftarrow 2^3\Sigma_g^-$ band; in β-O_2, it is polarized perpendicular to the c axis of the hexagonal cell. The energies of this and other transitions among the $^3\Sigma_g^-$, $^1\Delta_g$, and $^1\Sigma_g^+$ states increase with increasing pressure. The spectra and visual observations of the transformation between orthorhombic and ε-O_2, whose structure has not been determined, suggest that ε-O_2 has a layered structure. Absorption spectra of orthorhombic and ε-O_2 for light propagating perpendicular to the layers are dominated by a moderately strong band which moves from the UV through the visible with increasing pressure and a very strong ultraviolet band. These bands can be assigned as excitations from π^4-π^{*2} states to π^3-π^{*3} states which are mixed with intermolecular-charge-transfer excitations. Both bands move toward longer wavelengths at high pressures. At pressures above 13 GPa, absorption features for light propagating in the planes of the ε-phase structure can be assigned as $2^1\Delta_g \leftarrow 2^3\Sigma_g^-$. However, between 10 and 13 GPa, this feature is absent, and the pressure dependence of the Raman spectrum also is unusual. Both observations suggest that, between these pressures, the molecules reorient with respect to the crystallographic axes. (15 refs.)

102906 Coupling between molecular and charge transfer excitations in mixed alkali halide-cyanide crystals. S.S.Camargo,Jr., J.P.von der Weid (Dept. de Fisica, Pontificia Univ. Catolica, Rio de Janeiro, Brazil).
Radiat. Eff. (GB), vol.72, no.1-4, p.177-83 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The optical absorption spectra of mixed alkali halide cyanide crystals [$M(CN)_xY_{1-x}$ where M=Na, K, Rb and Y=F, Cl, Br, I] were measured at temperatures ranging from 300K down to 4.2K and CN^- concentrations from 10^{-2}% up to pure cyanide crystals. The absorption cross sections of the parity forbidden $X^1\Sigma^+ \rightarrow a'^3\Sigma^+$ vibronic transitions of the CN^- molecular ions were found to present a strong, non-linear dependence on the x-composition of the mixed crystal as well as on the halide ion. This behaviour is explained by the coupling of the triplet molecular excitations to singlet charge transfer excitations in their neighborhood. The experimental data were fit with a coupling energy of a few meV, depending mainly on the type of excitations involved (localized or collective) and not on the particular halide ion. The coupling mechanism is discussed and it is found to be due to the overlap between the wavefunctions of the two excitations. (7 refs.)

102907 Optical absorption and electron paramagnetic resonance studies of colorless and pink beryl. A.G.Blak, S.Isotani, S.Watanabe (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.285-92 (June 1982).
The results of the optical absorption (OA) and electron spin resonance (EPR) measurements of colorless and pink beryl, heated and ultraviolet (UV) irradiated are presented. In the UV region of the OA spectra, bands are observed at 36000 cm^{-1} and 42000 cm^{-1}. The UV irradiation produces atomic hydrogen, stabilized in the crystal lattice at room temperature. This was revealed by the presence of H^0 lines, in the EPR spectrum. (8 refs.)

102908 Electronic absorption spectrum of Cu^{2+} ions doped in zinc cesium sulphate hexahydrate. K.Purandar, J.Lakshmana Rao, S.V.J.Lakshman (Dept. of Phys., SV Univ., Tirupati, India).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.255-63 (1983).
The optical absorption spectrum of Cu^{2+} ions doped in $ZnCs_2(SO_4)_2.6H_2O$ single crystals has been studied at room (300K) and liquid nitrogen (77K) temperatures. From the nature and positions of the bands observed, a successful interpretation of all the bands could be made assuming D_{2h} site for Cu^{2+} ions in zinc cesium sulphate hexahydrate, ESR studies of the sample confirm

the site symmetry of the central metal ion. Taking $^2A_{1g}(d(x^2-y^2))$ as the ground state in D_{2h} symmetry, the four absorption bands at 77K are attributed to the transitions to $^2A_{1g}(d(z^2))$, $^2B_{1g}(d_{xy})$, $^2B_{2g}(d_{xz})$ and $^2B_{3g}(d_{yz})$, respectively, in the order of increasing energy. 102909 Spectral properties of glassy tetraphosphate with high neodymium (Nd^{3+}) concentration. Qi Changhong, Gan Fuxi (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.433-7 (April-June 1983).
Nd^{3+} doped glassy tetraphosphate laser material with Nd^{3+} concentrations of 0.13×10^{21} to 4×10^{21} cm^{-3} was studied, and the spectral characteristics for this laser glass were reported. Concentration quenching mechanism of Nd^{3+} ions in these materials was discussed. (12 refs.)

102910 Correlation of photoluminescence and symmetry studies with photoexcitation and decay processes of infrared active defects in Si. W.J.Vidinski, A.J.Steckl, J.C.Corelli (Center for Integrated Electronics, Rensselaer Polytech. Inst., Troy, NY, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.4097-103 (July 1983).
Defects introduced in silicon by neutrons and ions which give rise to infrared active electronic defect absorption bands after heat treatment to 500°C were studied using a dual beam optical method. The measurements were made in the 11-90K temperature range on four defect bands found in the 900 (11.1)-1100 cm^{-1} (9.09 μm) region of the infrared spectrum. The studies yield results on the capture cross sections of photoexcited electrons from defects which lead to a model of a defect having three different charge states. These cross sections are much smaller than those reported for the photoionization cross sections of chemical impurities such as Au in silicon. The states found in this study can be identified with photluminescence peaks reported by others near 1 and 0.76 eV. Additionally, there are two different symmetries assumed by the defects responsible for the defect absorption bands. (23 refs.)

102911 Optical absorption in PbTe doped with Cr. M.I.Baleva, L.D.Borissova (Faculty of Phys., Univ. of Sofia, Sofia, Bulgaria).
J. Phys. C (GB), vol.16, no.24, p.L907-11 (30 Aug. 1983).
The absorption spectrum of PbTe doped with Cr is measured in the photon energy range between 0.1 eV and 0.34 eV at room temperature. The observed impurity absorption band is assigned to optical transitions from the bottom of the conduction band to a widened term of the Cr^{3+} ion. The density of states in the Cr^{3+} impurity band is described by a Lorentzian dispersion curve. (10 refs.)

102912 Impurity band in dilute mixed molecular crystals. K.Wanachote (Dept. of Phys., King Mongkut Inst. of Technol., Thonburi, Thailand), I.M.Tang.
J. Sci. Soc. Thailand, vol.9, no.2, p.63-72 (June 1983).
The monomer self energy in dilute mixed molecular crystals is obtained by considering a set of diagrams which when summed yields a self energy expression in the form of a continued fraction. Using some theorem concerning Sturm sequences, the analytic behavior of the exciton propagator is obtained. The bandwidth of the impurity band in dilute $C_{10}D_8/C_{10}H_8$ mixed naphthalene crystals is determined by examining the branch cut appearing in the exciton propagator. (14 refs.)

102913 Optical absorption of *3d* transition metal and rare earth elements in zirconium fluoride glasses. Y.Ohishi, S.Mitachi, T.Kanamori, T.Manabe (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
Phys. & Chem. Glasses (GB), vol.25, no.5, p.135-40 (Oct. 1983).
Absorption spectra of *3d* transition metal and rare earth elements in zirconium fluoride glasses were measured and their absorptivities in the near to mid infrared range have been evaluated. The absorptivities of Fe, Co, Ni, and Cu are, respectively, 90, 130, 90, and 3 dB/2km/2ppm at the 2 μm band; their effective absorption is low above 3 μm. Rare earth elements such as Ce, Pr, Nd, Sm, Eu, Tb, and Dy have sharp adsorption bands in the 2 to 5 μm range and their peak absorptivity is between 1 and 100 dB/km/ppm. In order to obtain a fluoride glass fibre with a transmission loss of less than 0.1 dB/km at 2.5 μm, the Fe, Co, or Nd content should be less than 1 ppb and the Ni, Pr, Sm, or Eu content should be less than 10 ppb. (12 refs.)

102914 Optical spectra of Pb^{2+} to monitor the precipitation behavior of NaCl:Cd. J.Garcia Sole, C.Zaldo, F.Agullo-Lopez (Dept. de Optica y Estructura de la Materia, Univ. Autonoma de Madrid, Madrid, Spain).
Phys. Status Solidi a (Germany), vol.78, no.1, p.85-91 (16 July 1983).
A small concentration of Pb^{2+} ions is introduced into crystals of NaCl:Cd to monitor the aggregation and precipitation behavior of cadmium in NaCl. The evolution of the absorption and emission spectra of Pb^{2+} is followed during ageing and thermal annealing treatments. Moreover, the annihilation behavior of those spectra is correlated with that measured for the Raman peaks associated to Suzuki-phase precipitates. The main conclusion of this work is that Pb^{2+} becomes incorporated in the Suzuki-phase of Cd and gives rise to an absorption band at 274 nm and a corresponding emission band at 460 nm. On the other hand, absorption and luminescence bands occurring at 284 and 390 nm, respectively, are attributed to Pb^{2+} included in another precipitated phase. This phase develops at ageing temperatures $<80°C$ and its structure is not definitely identified. (16 refs.)

102915 Optical absorption spectra of mercury centres in KCl and NaCl. B.S.Acharya (Regional Res. Lab., Buhubaneswar, India), A.K.Panda.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K81-5 (16 July 1983).
γ-irradiation and F-light bleaching were performed on KCl:Hg and NaCl:Hg samples to see their effect and hence to identify the nature of impurity centres. The optical absorption spectra were recorded in a Cary 17-D model spectrophotometer. All the spectra were recorded at room temperature and in the range between 200 to 800 nm. (4 refs.)

102916 Theoretical study of optical absorption in hydrogenated amorphous silicon. W.E.Pickett (Condensed Matter Phys. Branch, Naval Res. Lab., Washington, DC, USA), D.A.Papaconstantopoulos, E.N.Economou.
Phys. Rev. B (USA), vol.28, no.4, p.2232-4 (15 Aug. 1983).
The authors present the first application of the coherent-potential approximation in the evaluation of optical absorption $\alpha(E)$ of α-SiH_x with the use of a realistic multiband model. The optical gap is larger than the calculated density-of-states gap and the theoretical $\alpha(E)$ agrees well with experimental data. These results suggest that $\alpha(E)$ is determined primarily by the local H-Si configuration and short-range order but that it is insensitive to the particular long-range order, which is not included in the model. (10 refs.)

102917 Photochemical conversion and optical absorption spectra of V centers in coloured KI crystals. T.Okada (Phys. Lab., Setsunan Univ., Osaka, Japan).
Radiat. Eff. (GB), vol.72, no.1-4, p.271-5 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The initial V_2 and V_3 bands observed after quenching of coloured KI crystals are found to be the superposition of absorption bands due to two kinds of V centres with ⟨110⟩ and ⟨111⟩ symmetries. The ratio of concentrations of the former to the latter V centers is estimated to be about 3:1. When a quenched crystal is irradiated at 19K with V_3-light in the 270-nm region, V centers are bleached forming I_2^--like centers. On the basis of the I_3^- molecule-ion model bound to a cation vacancy, a review is given of recent work on the photochemical conversion of V centers at low temperatures. (10 refs.)

102918 Optical characteristics of alkali zinc silicate glasses containing iron sulfide. B.G.Varshal, V.V.Samoteikin, Z.N.Kislyak, L.L.Mirskikh, N.D.Petrova (State Sci.-Res. Inst. of Glass, Moscow, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.304-9 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.445-50 (July-Aug. 1982). [received: May 1983]
After heat treatment of a zinc sulfide glass, it was observed that the absorption in the shortwave region decreases and in the longwave region of the spectrum increases; this is associated with the FeS→FeO transformation; the amount of FeO which is formed is equal to the decrement in the FeS. An evaluation has been made of the molar natural absorption index of FeS in the visible region of the spectrum. (10 refs.)

102919 Spectral absorption of iron in silicate optical glasses. A.B.Atkarskaya, L.I.Demkina, G.A.Nikolaeva (S.I. Vavilov State Optical Inst., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.309-12 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.451-5 (July-Aug. 1982). [received: May 1983]
It is shown that the approximation method of calculating the concentrating tri- and divalent iron in optical glasses makes it possible to obtain reliable data which is in close agreement with the data obtained using the more exact spectrophotometric method. In the crown-type of glasses, the proportion of Fe (II) is determined by the sum of the oxides of the alkali metals, calcium, and barium and in flints by the oxides of alkali metals and lead. 78.55 PHOTOLUMINESCENCE

102920 Fluorescence of rare earth ions adsorbed on porous Vycor glass. H.Mack, R.Reisfeld, D.Avnir (Inst. of Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.238-9 (5 Aug. 1983).
Fluorescence of rare earth (RE) ions arising from f-f transitions in Pr^{3+}, Eu^{3+}, Tb^{3+}, Dy^{3+}, Ho^{3+}, Er^{3+} and Tm^{3+} was observed from the ions adsorbed on porous Vycor glass or on pressed discs of fumed silica. The non-radiative relaxations of the excited states were depressed as a result of a strong chemical bond between the ions and silica acting as a ligand. (10 refs.)

102921 An anomalous emission from $Ru(bpy)_3^{2+}$ adsorbed onto porous Vycor glass. S.Wei, H.D.Gafney (Dept. of Chem., City Univ. of New York, New York, NY, USA), J.B.Clark, D.J.Perettie.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.253-7 (5 Aug. 1983).
Tris(2,2′-bipyridine)ruthenium(II), $Ru(bpy)_3^{2+}$, cation exchanges onto porous Vycor glass without a change in its absorption or resonance Raman spectra. When excited with an intense 355 nm laser pulse, the adsorbed complex undergoes biphotonic excitation followed by emission with a maximum at 510 nm and a shoulder at 610 nm. The 510 nm emission decays via a fast non-exponential process whereas that at 610 nm is exponential with a lifetime similar to that in aqueous solution. (15 refs.)

102922 Dynamics of energy of transport in ternary molecular solids. II. Time evolution of naphthalene fluorescence. P.Argyrakis, R.Kopelman (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
Chem. Phys. (Netherlands), vol.78, no.2, p.251-63 (15 July 1983).
For pt.I see ibid., vol.57, no.1-2, p.29-44 (1981). The spectrally resolved time-evolution of free and trapped singlet excitons was obtained at liquid-helium temperature for ternary crystals of perdeuteronaphthalene/naphthalene/betamethylnaphthalene (host/guest/supertrap). The naphthalene guest (donor) concentration varied between 0.30 and 0.99 mole fraction, while the supertrap (acceptor) concentrations were 10^{-4}-10^{-5}. At the lower guest concentrations (0.50 and below) the naphthalene-exciton decay time approaches the natural lifetime ($\approx$122 ns). At higher concentrations, the decay is much shorter and extremely non-exponential. This behavior is inconsistent with simple homogeneous kinetics schemes that use a time-independent rate constant for energy transport. Above the percolation concentration (0.60 naphthalene) the authors fitted the experimental results with a random-flight-kinetic model, incorporating correlated random walks on the percolating guest cluster. The best fit was obtained for a 'coherence length' (mean free path) of $\approx10^2$ lattice units. These results are in good agreement with previous steady-state studies on the same samples, and seem to indicate a partial coherence of the exciton transport in both pure and substitutionally disordered crystals at these low temperatures. (62 refs.)

102923 On the use of X-ray-excited optical luminescence (XEOL) for the analysis of multisite rare-earth systems. P.Tola, A.Retournard (Interactions Moleculaires, Univ. de Nancy I, Vandouevre les Nancy, France), J.Dexpert-Ghys, M.Lemonnier, M.Pagel, J.Goulon.
Chem. Phys. (Netherlands), vol.78, no.3, p.339-45 (1 Aug. 1983).
The realization of a XEOL (X-ray-excited optical luminescence) spectrometer is reported. The aim of the paper is to show that a comparison between UV-excited emission spectra and XEOL spectra can be helpful in the assignment of some weak transitions for multiple site rare-earth compounds. The case of c-Y_2O_3 doped with Eu^{3+} cations is considered in some detail, as in the XEOL spectrum three lines to be assigned to transitions occurring at the

centrosymmetrical $Eu^{3+}(C_{3i})$ site are strongly enhanced. Additional site-selective UV-excited emission spectra are also reported supporting the discussion. (30 refs.)

102924 Dispersive singlet exciton motion in an organic glass. R.Jankowiak, H.Bassler (Fachbereich Phys. Chem., Philipps-Univ., Marburg, Germany).
Chem. Phys. (Netherlands), vol.79, no.1, p.57-67 (15 Aug. 1983).
Fluorescence spectra of both pure and coronene-doped 9,10-diphenylanthracene glasses prepared at 4.2K have been measured at 4.2K as a function of excitation energy E_{ex}. The spectroscopic properties of the guest are inferred from both fluorescence and fluorescence excitation spectra of coronene incorporated into a phenanthrene matrix. Analysis of the DPA(C) fluorescence spectra indicates that the number of new sites a DPA singlet exciton can visit during its random walk through the host matrix decreases as the excitation energy is scanned down the low-energy tail of the inhomogeneously broadened $S_0 \rightarrow S_1$ 0-0 transition. The effect is explained in terms of a time-distribution of hopping rates characterized by a dispersion parameter $\alpha=0.7$. The hopping rate in the $t \rightarrow 0$ limit is proportional to the square of the density of states at a given excitation energy reflecting dipolar coupling. Dispersion arises from energetic relaxation of the exciton. (31 refs.)

102925 Photoluminescence measurements of Zn-doped $Ga_{1-x}Al_xAs$ grown by metalorganic chemical vapor deposition. Z.Y.Xu, V.G.Kreismanis, C.L.Tang (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4536-42 (Aug. 1983).
Investigates the photoluminescence properties of Zn-doped $Ga_{1-x}Al_xAs$ grown by metalorganic chemical vapor deposition (MOCVD). The photoluminescence spectra exhibit weak bound-exciton lines, donor-acceptor pair transitions, free-to-bound excitons, and low energy broad bands. The Zn acceptor ionization energy is determined from the free-to-bound transitions as a function of aluminum concentration x up to 0.46. Two low energy bands have been observed in Zn-doped $Ga_{1-x}Al_xAs$. One is at ~1.65 eV and is identified as due to the Zn_{Ga}-V_{As} complex. Another band has been observed at ~1.81 eV from samples with x near or beyond the crossover. It is well separated from the band edge, but its origin is not yet well understood. (36 refs.)

102926 Optical and crystallographic properties and impurity incorporation of $\alpha_xIn_{1-x}As$ ($0.44<x<0.49$) grown by liquid phase epitaxy, vapor phase epitaxy, and metal organic chemical vapor deposition. K.-H.Goetz (Inst. fur Halbleitertech., RWTH Aachen, Aachen, Germany), D.Bimberg, H.Jurgensen, J.Selders, A.V.Solomonov, G.F.Glinskii, M.Razeghi.
J. Appl. Phys. (USA), vol.54, no.8, p.4543-52 (Aug. 1983).
Optical, crystallographic, and transport properties of nominally undoped n-type and Zn doped p-type $Ga_xIn_{1-x}As/InP$ ($0.44<x<0.49$) grown by liquid phase epitaxy (LPE), vapor phase epitaxy (VPE), and metal organic chemical vapor deposition (MOCVD) have been studied and related to the different growth methods. Samples grown by LPE show in general much larger luminescence intensities than the VPE samples with similar impurity concentration and less structural and compositional inhomogeneities. Peaks related to free and bound excitons and to different impurities are found in the photoluminescence and absorption spectra of the undoped samples. The binding energy of the exciton is determined to be 2.1 ± 0.1 meV, in agreement with hydrogenic theory. A longitudinal optical (LO) phonon energy of 32 ± 0.5 meV is derived from LO-phonon replica of the exciton line. The dependence of the energy gap at $T=2$K from the solid solution composition in the range $x_{Ga}=45\%$-49% is determined yielding a bowing parameter of $C=0.475$ and a gap value of $E_g=0.811$ eV at optimum lattice match. Data on donor-acceptor pair transitions observed in the photoluminescence spectra are combined with secondary ion mass spectrometry data to identify for the first time different acceptors: C, Zn, and Si. Their binding energies are 13 ± 1, 22 ± 1, and 25 ± 1 meV, respectively. C is the dominant acceptor in the MOCVD samples, but is hardly observable in the LPE and VPE samples. Si and Zn are present in LPE, VPE, and MOCVD samples. The Zn doped p-type samples show a broad donor-Zn-acceptor pair transition band accompanied by a weak LO-phonon replica and a very weak exciton line. (32 refs.)

102927 Zeeman spectroscopy of luminescence from vanadium-doped indium phosphide. M.S.Skolnick, P.J.Dean (Royal Signals & Radar Establ., Great Malvern, England), M.J.Kane, C.Uihlein, D.J.Robbins, W.Hayes, B.Cockayne, W.R.MacEwan.
J. Phys. C (GB), vol.16, no.21, p.L767-75 (30 July 1983).
The authors have observed quite strongly-phonon-coupled photoluminescence (PL) in V-doped InP with a sharp no-phonon line near 705 meV and an excited state splitting of 1.55 meV. Detailed Zeeman data on the cold line are reported. The ground state is shown to be a pure spin triplet, $g\approx2$ and must arise from the ${V_{In}}^{3+}(d^2)$ charge state. The PL is ascribed to transitions between the $^3T_2(^3F)$-$^3A_2(^3F)$ levels of ${V_{In}}^{3+}$. A marked tetragonal anisotropy is found in the excited states of the transitions. This is tentatively attributed to an almost static Jahn-Teller effect in the $^3T_2(^3F)$ state. A similar attribution is proposed for qualitatively similar PL spectra observed by U. Kaufmann et al. (1982) in GaAs and GaP. (11 refs.)

102928 The luminescence at 0.839 eV in GaAs:Cr. A split ^5E-$^5T_2$ transition. J.Barrau, M.Brousseau (Lab. de Phys. des Solides, INSA, Toulouse, France), S.P.Austen, C.A.Bates.
J. Phys. C (GB), vol.16, no.23, p.4581-98 (20 Aug. 1983).
The luminescence at 0.839 eV in GaAs:Cr is interpreted as a split ^5E-$^5T_2$ transition within the Cr^{2+} ion. The degeneracies are removed by first- and second-order trigonal-field and spin-orbit-coupling perturbations. The parameters appearing in the effective Hamiltonians for ^5E and $^5T_2$ are all deduced from the high-resolution photoluminescence spectroscopy of Barrau and co-workers (1982); the fit of the energy levels and oscillator strengths provides a very accurate solution. The electronic and Jahn-Teller parameters are deduced. These results lead to a complete interpretation of the magnetic field Zeeman splittings of Eaves (1980), Killoran and co-workers (1980). The accuracy of the interpretation of all the experimental results represents an important improvement on previous models. In particular, the authors show how the interpretation of the ground state a ^5E (C_{3v}) is a poor approximation to the results presented. (26 refs.)

102929 The decay of infrared luminescence in II-VI compound semiconductors doped by 3d transition elements. R.Renz, H.-J.Schulz (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
J. Phys. C (GB), vol.16, no.24, p.4917-32 (30 Aug. 1983).
The decay processes of infrared emission after laser excitation have been studied in a sampling technique for several crystalline II-VI materials: ZnS and/or CdS doped by V, Cr, Co, Ni or Cu. From the exponential decay curves with time constants $0.5\leq\tau\leq50$ μs recorded at low temperatures, transition probabilities have been derived and compared with calculated electric-dipole matrix elements. Two different interactions are considered by which the parity-forbidden d-d transitions of 3d impurity ions become allowed: in a covalent model, the contribution of the wavefunctions of neighbouring ions is treated by LCAO-MO methods. In a configuration mixing model, lattice vibrations induce a mixing of 4p states of the transition-metal ion with the 3d levels. Configuration mixing appears to be the prevailing mechanism for the internal transitions considered here. The temperature dependence of the lifetime from 4 to 300K is also studied and can be interpreted by means of a configuration-coordinate model. (61 refs.)

102930 Luminescence of silver halides. I. Influence of precipitation parameters on the delayed luminescence of silver bromide microcrystals. A.de Rouck (R&D Labs., Agfa-Gevaert NV, Mortsel, Belgium).
J. Photogr. Sci. (GB), vol.31, no.4, p.170-5 (July-Aug. 1983).
The relation between delayed luminescence and photographic properties of silver halide has been investigated with monodisperse AgBr microcrystals precipitated under different reducing circumstances. According to the theories of electron and hole trapping properties of aggregates of silver atoms, the author concludes that luminescence centres activating the emission at 610 and 760 nm, are reduction centres with specific nature and function in the photographic process. (7 refs.)

102931 Luminescence of rare earth activated polymorphous perovskites $Sr_2Sr_{1/4}Gd_{1/2}\square_{1/4}WO_6(=Sr_8SrGd_2\square W_4O_{24})$. K.K.Closs, S.Kemmler-Sack (Inst. fur Anorganische Chem., Univ. Tubingen, Tubingen, Germany).
J. Solid State Chem. (USA), vol.48, no.2, p.295-9 (1 July 1983). (3 refs.)

102932 The comparison of calculated transition probabilities with luminescence characteristics of erbium (III) in fluoride glasses and in the mixed yttrium-zirconium oxide crystal. R.Reisfeld, G.Katz (Dept. of Inorganic & Analytical Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel), C.Jacoboni, R.De Pape, M.G.Drexhage, R.N.Brown, C.K.Jorgensen.
J. Solid State Chem. (USA), vol.48, no.3, p.323-32 (15 July 1983).
Fluorozirconate glasses containing 2 mole% ErF_3 were prepared by melting the binary fluorides with ammonium bifluoride under an atmosphere of carbon tetrachloride and argon at 850°C. Absorption spectra of these glasses were obtained and the Judd-Ofelt parameters were calculated. Emission spectra and lifetimes of erbium in fluorozirconate glass, in lead-gallium-zinc fluoride glass, and in yttrium-zirconium oxide crystal were measured and compared with the theoretical calculations. Laser emission lines in these materials are deduced from these measurements. It is suggested that materials doped with erbium may serve as light sources for fiber optic waveguides made from the undoped materials. (30 refs.)

102933 Effect of protonation of luminescent characteristics of xanthene dyes. V.Ya.Artyukhov, R.T.Kuznetsova, R.M.Fofonova.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1134-7 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.576-80 (Oct. 1982).
The spectral luminescent characteristics of protonated forms of R6G are investigated. When the medium is acidified to pH=0.4, 50% of the cationic R6G molecules in an aqueous solution are protonated on one of the ethylated amino groups. In this case the longest-wave R6G band, associated with the transfer of electronic density from the two nitrogen atoms to the central carbon atom disappear, and the broad structured band associated with the transfer of electronic density from the unprotonated nitrogen, shifted in the short-wave direction relative to the cationic band, becomes the longest-wave band; hence, the R6G molecule excited into the long-wave becomes more basic than in the ground state. The authors think that further acidification of the medium leads to protonation of the second amino group. (8 refs.)

102934 Luminescence fatigue of silver chloride crystals. A.N.Latyshev, V.V.Bokarev, T.V.Voloshina, M.A.Kushnir, V.N.Raskhozhev, L.B.Antakanova.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1137-41 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.580-5 (Oct. 1982).
Silver halides, particularly silver chloride, crystals are extremely sensitive to radiation and undergo changes when they are exposed to ultraviolet light, even at low temperatures. In this case the intensity of the steady-state luminescence is reduced. This effect is called luminescence fatigue. An investigation of luminescence fatigue in relation to temperature showed that exposure of silver chloride crystals to light gives rise to two processes with activation energies of about 0.05 and 0.01 eV. It was postulated that the movement of silver ions over the surface due to the action of light gives rise to deep electron traps. The interpretation, however, is ambiguous. The authors carried out an investigation with the aid of luminescence flash photostimulation spectra, which can be used to investigate deep electron traps. They attempted to separate the processes with different activation energies. (10 refs.)

102935 Spectral luminescence properties and the nature of the emission centers in LiF-U(VI) crystals. N.I.Aleshkevich, Yu.I.Krasilov, V.V.Syt'ko.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1141-6 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.585-91 (Oct. 1982).
The authors have attempted to elucidate the nature of the luminescence centers in LiF-U(VI) crystals on the basis of luminescence and luminescence excitation spectra, along with measurements of the luminescence decay kinetics of the various lines, and to relate that nature to the anomalies in the spectral luminescence properties of the centers. (24 refs.)

102936 Structure of the luminescence spectra of impurity ${UO_2}^{2+}$ ions in solid solutions of halide salts. I.Ya.Kushnirenko, V.I.Sheremet.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1146-51 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.591-7 (Oct. 1982).
The authors studied the luminescence spectra of ${UO_2}^{2+}$ impurity ions in frozen water solutions of alkali halide salts (LiCl, LiBr, KCl, KBr, etc.) in the temperature interval 1.62-77K. Their main attention is devoted to the analysis of the structure of the spectra. A comparison of the spectroscopic properties of these impurity cations in various matrices provides a means of studying more deeply the mechanisms and the nature of the interaction of the impurity with its environment, both in crystals and also in solid solutions of the alkali halide salts. (11 refs.)

102937 Influence of substrate temperature and activator concentration on the structure of optical centers in thin film luminophores. F.Z.Gil'fanov, E.L.Kvasov.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1151-3 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.597-9 (Oct. 1982).
An important factor in determining the spectroscopic properties of impurity luminophores is the activator concentration. The work is devoted to the elucidation of the simultaneous operation of these two determing factors. The authors have studied the photoluminescence spectra of $CaF_2:Gd^{3+}$ thin films with a concentration of GdF_3 in the mixture from 0.01 to 30 wt.%, $SrF_2:Gd^{3+}$ films with GdF_3 concentration from 0.1 to 30 wt.%, deposited on substrates at various temperatures. On the basis of these studies they draw conclusions as to the existence of three concentration regions for these luminophores. (3 refs.)

102938 Optical properties of fluorite-type crystals with M_A color centers. V.A.Arkhangel'skaya, V.M.Reiterov, L.M.Trofimova, A.S.Shcheulin.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1192-4 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.644-8 (Oct. 1982).
Singly-charged alkali ions A^+ in crystals of alkaline-earth fluorides MeF_2 (Me=Ca, Sr) cause the formation of anion vacancies in association with the

impurity ion. Such vacancies after radiation-induced or additive coloring give rise to electronic disturbed color centers of the F_A, $(F_2)_A$, and $(F_3)_A$ types, and to even more complex centers containing a larger number of vacancies. Of great interest of two adjacent anion vacancies, two electrons, and an A^+ ion located in the nearest cation site. The authors give the results of symstematic investigations of the spectral absorption and luminescence properties, quantum yield, and kinetics of the luminescence of MeF_2-A^+ crystals containing M_A centers, where Me=Ca or Sr, and $A^+=Li^+$, Na^+, or K^+. (11 refs.)

102939 Effect of hyperfine interaction on the luminescence of Pb^{2+} and Bi^{3+} centers in alkaline-earth chalcogenides. N.Yamashita, S.Asano (Dept. of Phys., Okayama Univ., Okayama, Japan).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.375-8 (18 July 1983).
Emission spectra of MgS, CaO, CaS, CaSe and SrS phosphors activated with a Pb^{2+} or a Bi^{3+} ion are measured at 4.2K. By the analysis of the phonon structure of the ${}^3A_{1u} \rightarrow {}^1A_{1g}$ emission band, it is found that the hyperfine interaction provokes the zero-phonon line on the emission band for the alkaline-earth chalcogenide phosphors activated with a Pb^{2+} or a Bi^{3+} ion. (21 refs.)

102940 Vibrational fluorescence of CN^- defects in KCl excited by coupling to optically pumped *F* centers. Yihong Yang, F.Luty (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.419-22 (1 Aug. 1983).
Vibrational emission from molecular defects in ionic crystals has been observed for the first time, realized by dilute CN^- defects in KCl which emit a long-lifetime fluorescence at 4.8 μm. After association of *F* centers to the CN^- defects, the emission can be pumped efficiently by optical *F*-center excitation through electronic-vibrational coupling. This coupling is confirmed through Raman experiments. Relative intensity, emission spectra, and lifetime data as a function of crystal temperature are reported for the 4.8-μm emission. (8 refs.)

102941 On the time dependence of the luminescence spectrum in chalcogenide glasses. M.Suhrke (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K79-83 (1 July 1983).
Presents a calculation of the long-time behaviour of the photoluminescence spectrum in a-As_2S_3. In this material a slow shift of the peak energy to lower energies in a wide range of times from $t \approx 10^{-8}$ to $t \approx 10^{-2}$ s is observed. The author considers a recombination model based on tunneling between localized states in the gap. In this gap states the carriers are immobile at low temperatures. The holes are bound at D−-centres with energy $E_R \gtrsim 0.5$ eV above the valence-band edge which are centres of radiative recombination (r-centre) in chalcogenide glasses. (9 refs.)

102942 On the 430 nm emission band in the NaCl:Pb^{++} system. R.Capelletti, O.Carranza Torres, J.Garcia Sole, M.Manfredi (Istituto di Fisica, Univ. degli Studi di Parma, Parma, Italy).
Phys. Status Solidi a (Germany), vol.78, no.1, p.35-9 (16 July 1983).
The temperature dependence of luminescence and of the decay times of the 430 nm emission band is studied in the NaCl:Pb^{++} system heavily doped and annealed for long time at 200°C. This emission band—that is excited at 262 or 267 nm-is found to behave very similarly to a corresponding emission band present in the $PbCl_2$ system, this fact supporting the hypothesis that the 430 nm emission is connected with a $PbCl_2$ phase growing in the NaCl matrix. The temperature dependent lifetime is explained in terms of radiationless processes thermally activated with an activation energy of 0.13 eV. (14 refs.)

102943 The luminescence of Bi^{3+} and Mn^{2+} in lanthanum magnesium borate ($LaMgB_5O_{10}$). M.Saakes, G.Blasse (Phys. Lab., State Univ., Utrecht, Netherlands).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K97-9 (16 July 1983).
The authors report on the luminescence of some non-rare-earth ions in the $LaMbG_5O_{10}$ host lattice. Obvious choices for this are Bi^{3+}on La^{3+} sites and Mn^{2+} on Mg^{2+} sites. The Mn^{2+} ion acts as an efficient activator in $LaMgB_5O_{10}$. Under excitation the total light output of the luminescence is low, however, because the absorption strength of the Mn^{2+} ion is weak over the whole visible and UV region, i.e. for λ>240 nm. The Mn^{2+} ion in $LaMgB_5O_{10}$ shows a red emission. The emission spectrum consists of a band with a halfwidth of about 70 nm and a maximum at about 620 nm. These values relate to room temperature as well as liquid helium temperature. (8 refs.)

102944 Resonant two-photon absorption by exciton polaritons in evaporated CuCl films. J.K.Pribram, G.L.Koos, F.Bassani, J.P.Wolfe (Dept. of Phys. & Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1048-55 (15 July 1983).
Biexcitons in CuCl decay into Z_3 excitons (longitudinal or transverse) and photons (M_L or M_T luminescence). Here an intense, tunable-laser pulse is used to study this luminescence in thin CuCl films. As a function of laser frequency (3.209-3.219 eV) the luminescence line shapes in the M_L and M_T bands show absorption which the authors interpret as a resonant two-photon (laser plus luminescence) transition from the ground to biexciton state. The polariton nature of the intermediate state is explicitly considered and shown to bring about a resonant condition, greatly enhancing the absorption process. Reabsorption involving the upper and lower transverse polariton branches has been reported previously. Here they report a new transition which uses the longitudinal exciton as an intermediate state. From laser frequencies and these three reabsorption dip positions they determine a portion of the Z_3 exciton-polariton dispersion curve. (33 refs.)

102945 Radiative transitions associated with two-acceptor-one-donor complexes in epitaxial GaAs and InP. D.C.Reynolds, C.W.Litton, E.B.Smith, K.K.Bajaj (Avionics Lab., Air Force Wright Aeronaut. Labs., Wright-Patterson US Air Force Base, Dayton, OH, USA), T.C.Collins, M.H.Pilkuhn.
Phys. Rev. B (USA), vol.28, no.2, p.1117-20 (15 July 1983).
Radiative transitions on the low-energy side of the exciton-neutral-acceptor transitions are reported in good-quality epitaxially grown samples of GaAs and InP at liquid-helium temperature. These lines result from transitions within a complex involving two shallow neutral acceptors and a single neutral donor. The initial state of the system consists of two neutral acceptors each with an exciton bound to it, and a neutral donor. The exciton collapses on one of the acceptors, giving part of its radiative energy to the second acceptor-exciton system to transfer the exciton to the neutral donor. The final state, therefore, consists of two neutral acceptors and a neutral-donor-bound-exciton system. The transition energies predicted on the basis of this model agree very well with the observed energies in both GaAs and InP. (9 refs.)

102946 Comment on nonradiative-recombination kinetics in *a*-Si:H. D.J.Dunstan (Angewandte Phys., Johannes Kepler Univ., Linz, Austria).
Phys. Rev. B (USA), vol.28, no.4, p.2252-3 (15 Aug. 1983).
In a recent paper, Collins et al. (Phys. Rev. B.26, 6643, 1982) have shown that a fast process, occurring in <10, ns, is important in the nonradiative recombination of photoexcited carriers in sputtered *a*-Si:H, and so the slow process of tunneling to defects, in a time scale comparable to that of the radiative recombination, is not dominant, as previously believed from studies on glow-discharge material. The author considers the results in terms of the distant-pair model, and concludes that the fast and slow processes are in fact successive steps in the nonradiative mechanism. Also, he finds that a capture cross section for the defects comparable to that of the tail states is consistent with the data. (9 refs.)

102947 A study of recombination centres in $YAlO_3$, $EuAlO_3$, $LaAlO_3$ and Y_2O_3 using ODMR. R.L.Wood, W.Hayes (Clarendon Lab., Univ of Oxford, Oxford, England).
Radiat. Eff. (GB), vol.72, no.1-4, p.145-51 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
An ODMR study of $YAlO_2$ has been made at 1.6K using an X-ray induced luminescence band, peaking at 223 nm. The ODMR spectrum is unusual, showing the full symmetry of the crystal and also a weak exchange interaction between the recombining carriers. This behaviour is intermediate between that found for recombination of donor-acceptor pairs in semiconductors and for self-trapped excitons in strongly ionic solids. An intense luminescence band of Y_2O_3 at 364 nm does not show ODMR. Weak, sample-dependent luminescence of $EuAlO_3$ and $LaAlO_3$ in the near ultraviolet has also been studied but, again, does not show ODMR. (9 refs.)

102948 Emission of F centres in alkali halides under hydrostatic pressure. K.Asami (Inst. of Sci. & Industrial Res., Osaka Univ., Suita, Osaka, Japan), K.Iwahana, H.Ohkura, M.Ishiguro.
Radiat. Eff. (GB), vol.72, no.1-4, p.161-6 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The effect of pressure up to 12 kbar on the luminescent properties of F centers has been measured in some potassium and cesium halides at liquid helium temperature. A decrease of the F center emission intensity and a blue shift of a peak position with pressure are observed. The former is relevant to the non-radiative transition and the latter to the observed change in lifetime with pressure. The decay time observed under pressure shows an increasing tendency with temperature. A possible mechanism is proposed. (8 refs.)

102949 Optical properties of F_A and $(F_2)_A$ centres in doped KI. A.Scacco, G.Baldacchini, U.M.Grassano, E.Polito, F.Somma (Istituto di Fisica, Univ. di Roma, Roma, Italy).
Radiat. Eff. (GB), vol.72, no.1-4, p.185-91 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Crystals of additively coloured KI doped with lithium or sodium exhibit, after irradiation with F-light, new absorption and emission bands due to associated and perturbed centres. The defects responsible for these bands have been identified using excitation spectra and polarization measurements. F_A(I) and $(F_2)_A$ centres are found to be present in both KI:Li^+ and KI:Na^+ crystals. A weak emission in KI:Li^+ is ascribed to F_{13}(II) centres. The possibility of using these systems as laser active media is discussed. (14 refs.)

102950 Low energy photoluminescence of pure and doped LiF. R.Grasser, S.Scharmann, K.-R.Strack, G.Bruckenhaus, E.Ekpo Eno (Phys. Inst., Univ. Giessen, Giessen, Germany).
Radiat. Eff. (GB), vol.72, no.1-4, p.237-43 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Norminally pure LiF crystals from different sources show a very weak emission in the red spectral region with the maximum at 720 nm when excited with UV light. In pure crystals this photoluminescence is measurable only under extreme excitation and registration conditions. Besides broad band and zero-phonon line spectra due to F-aggregate centres, LiF/$CaWO_4$ crystals emit strong 720 nm fluorescence bands. Additionally to this feature, the LiF/$CaWO_4$ solid system exhibits a highly structured photoluminescence on the short wavelength side of the 720 nm peak. This line spectrum is already well resolved at 77K. The red emission is connected with the presence of Ca^{2+} ions in the LiF lattice. Transmission, excitation, and emission data, together with the results of annealing experiments, strongly indicate that the measured low energy photoluminescence is due to optical transitions in Z_2-centres. (9 refs.)

102951 The resonant secondary emission of the F center in alkali halides. Y.Mori, R.Hattori, H.Ohkura (Dept. of Appl. Phys., Osaka City Univ., Osaka, Japan).
Radiat. Eff. (GB), vol.72, no.1-4, p.283-6 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The secondary radiation after resonant excitation of F centers and the linear polarization *P* correlated to the polarization of resonant light have been measured for five alkali halides at low temperatures. In KCl, the spectrum of *P* over the whole Stoke region is divided into three successive regions; the depolarization range for the one-phonon Raman scattering, the near plateau range , and the depolarization range down to vanishing. The former two have common relevance to resonant energy and symmetries of coupled phonons. These relevances are interpreted adopting a configuration coordinate model for 2s- and 2p-like excited states. (11 refs.)

102952 Stimulated photoluminescence of CdTe. A.Cingolani, M.Ferrara, M.Lugara (Consiglio Nazionale delle Ricerche, Bari, Italy).
Solid State Commun. (USA), vol.47, no.8, p.607-9 (Aug. 1983).
Emission spectra of CdTe at low temperature under high intensity optical pumping by means of a tunable dye laser are reported. The authors show that the optical gain process is enhanced when a high exciton density is achieved by means of quasi-resonant pumping. The mechanism responsible for the amplification process is found to be the well-known exciton-exciton scattering. (11 refs.)

102953 Observation of population inversion of holes in Ge in crossed *E* and *H* fields from the spontaneous far-infrared emission. A.A.Andronov, V.I.Gavrilenko, O.F.Grishin, V.N.Murzin, Yu.N.Nozdrin, S.A.Stokliskii, A.P.Chebotarev, V.N.Shastin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.932-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.339-43 (Nov. 1982).
There is growing interest in hot holes in Ge in connection with the possibility of obtaining a laser effect in crossed electric and magnetic fields at the direct optical transitions between the sub-bands of the light and heavy holes (sub-bands 2 and 1, respectively), spanning a broad range in the far infrared (300>λ>40 μ). The authors give a criterion for the occurrence of an inversion of the 2-1 transitions on the basis of the shape of the spontaneous far-infrared emission as a function of E and H, discuss the results of an experimental observation of inversion in p-Ge, and study the dependence of the degree of inversion on the geometry of the sample and its orientation with respect to the magnetic field. (14 refs.)

102954 Investigation of anodic alumina by a photoluminescence method. I. Lj.D.Zekovic, V.V.Urosevic, B.Jovanic (Inst. of Phys., Belgrade, Yugoslavia).
Thin Solid Films (Switzerland), vol.105, no.2, p.169-76 (15 July 1983).
A new investigation of anodic oxide films on aluminium was performed using a photoluminescence method. An interference effect which follows both excitation and emission of photoluminescence was used to determine the anodic film thicknesses and the anodizing rate. The measured anodizing rate of aluminium in 0.1 M oxalic acid, $j=10$ mA cm^{-2} ($\kappa=0.325$ μm min^{-1}), is in excellent agreement with the values obtained by other methods. (12 refs.)

102955 High resolution laser diagnostics for direct gap semiconductor materials. R.P.Salathe, H.H.Gilgen (Inst. of Appl. Phys., Univ. of Berne, Berne, Switzerland).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.109-16
The laser-induced luminescence of direct gap semiconductors can be measured with high spatial (1 μm) and temporal (<1 ns) resolution. A profiling technique is described for in-situ measurements during laser processing. It allows the evaluation of temperature, carrier density and band gap energy within the focal zone. The technique has been applied to (Al,Ga)As heterostructure material subjected to highly focused CW-Kr-ion laser radiation. The measurements reveal low temperature rises (<200 deg.C) at high excitation densities (>1 MW/cm^2) and an inhomogeneous distribution of optically excited carriers for concentrations above 2×10^{17} cm^{-3}. 78.60 OTHER LUMINESCENCE SPECTRA AND RADIATIVE RECOMBINATION

(for photoconduction and photovoltaic effects, see 72.40; for photoluminescence, see 78.55)

102956 Shock-induced radiation spectra of fused quartz. K.Kondo, T.J.Ahrens (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA), A.Sawaoka.
J. Appl. Phys. (USA), vol.54, no.8, p.4382-5 (Aug. 1983).
An optical multichannel analyzer is applied to observe shock-induced radiation spectra of fused quartz in the 23-31 GPa shock-pressure range. Characteristics of sample-driver interface strongly influence both intensity and profile of the observed spectra. Brightness and color temperature are determined by an integration of spectral radiance and a fit to the greybody radiation spectrum, respectively. The resultant brightness and color temperature are lower and considerably higher than those estimated by the theoretical calculation, respectively. Some broad but strong line spectra are, however, superimposed onto the continuous greybody radiation spectrum even though the influences of the interface are reduced as much as possible. The line spectra are probably caused by electroluminescence and/or triboluminescence. (18 refs.)

78.60F Electroluminescence

102957 The electrooptical properties of ZnSe-ZnTe heterojunctions. F.Firszt, H.J.Lozykowski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.9-19 (July 1983).
The electrical properties, photoluminescence and injection electroluminescence in ZnSe-ZnTe *n-p* heterojunctions have been studied. The ZnTe layer was grown on a single ZnSe(111) crystal from Zn:ZnTe solution. The prepared heterojunctions consist of a *p-s-n* structure with distributed trap centers in the boundary region. At 40K the spectrum of electroluminescence consists of two bands 2.32 eV and 1.95 eV. Photoluminescence measurements show that light generation in the diode occurs at the ZnSe side of the junction. The time-resolved spectra (TRS) measurements show the spectral peak shift to lower energies with increasing delay after the excitation pulse for the red band. This is a conspicuous characteristic of the donor-acceptor pair recombination. (48 refs.)

102958 Electroluminescence in Cu-phthalocyanine. A.Das, A.K.Tripathi (Dept. of Phys., Saugar Univ., Sagar, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.368-9 (June 1983).
Voltage and frequency dependence of electroluminescent brightness have been studied for Cu-phthalocyanine at room temperature. The brightness varies according to the relation $B=B_0\exp(-C/V^{1/2})$ in the low-voltage region and according to $B=B_0\exp(-C/V)$ in the high-voltage region. (8 refs.)

102959 Efficiency of binderless electroluminescence in (ZnS,ZnO): Cu,Cl electroluminor. S.Bhushan (Dept. of Phys., Ravishankar Univ., Raipur, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.370-3 (June 1983).
Efficiency of binderless electroluminescence (EL) as a function of voltage of the applied field is investigated. It is found that efficiency first increases, passes through a maximum and then decreases. A new interpretation of binderless EL in terms of Schottky-emission type of transport process is proposed. (6 refs.)

102960 A study of the electrical and luminescence characteristics of a novel Si-based thin film electroluminescent device. D.J.Robbins, D.J.DiMaria, C.Falcony, D.W.Dong (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4553-69 (Aug. 1983).
The results of electrical and luminescence measurements on a new, low voltage, DC, thin film electroluminescent device structure are presented. The devices incorporate a two-phase Si-rich-SiO$_2$/SiO$_2$ electron injector layer which provides control of current, and an active luminescent ZnS:Mn layer in which light is generated by hot electron impact excitation of the Mn^{2+} activator in high electric field. Separation of the processes of current control and light generation into different layers permits the effects of space charge and the average field distributions to be determined. The electroluminescence intensity is simply proportional to the average power dissipated in the ZnS:Mn layer when the average field is in the range 0.6-1.2 MV cm^{-1}, and when field distortion due to electron trapping in the SiO$_2$ layer is small. When the field locally in the ZnS:Mn layer exceeds ~1.7 MV cm^{-1}, lattice ionization competes with impact excitation of Mn^{2+} and the quantum efficiency falls. A simplified model assumes that in a quasi-steady-state condition the majority of the device current is carried by electrons accumulated in the satellite (*L*,*X*) valleys in the conduction band of ZnS. The results are compared with previous studies, and their general significance as regards the limiting efficiency of high field electroluminescent devices using ZnS is discussed. (45 refs.)

102961 Photo- and electroluminescence spectra from an n-TiO$_2$ semiconductor electrode as related to the intermediates of the photooxidation reaction of water. Y.Nakato, A.Tsumura, H.Tsubomura (Dept. of Chem., Osaka Univ., Osaka, Japan).
J. Phys. Chem. (USA), vol.87, no.13, p.2402-5 (23 June 1983).
Photo- and electroluminescence spectra of an n-type TiO$_2$ electrode in aqueous solutions were measured as functions of the electrode potential and the solution pH, together with the current-potential curves. The photoluminescence spectrum showed a relatively sharp band peaked at 1.47 eV. From the quenching of the photoluminescence by reductants in solution, this band was concluded to arise from an oxidative surface species, called X$_{1.47}$, acting as an intermediate of the photooxidation reaction of water. It was shown that the species X$_{1.47}$ is originally absent at an n-TiO$_2$ surface, but produced and accumulated by illumination under anodic bias. It was also suggested, from a comparison of the electroluminescence spectra in H$_2$O$_2$ solutions with those in S$_2$O$_8^{2-}$ solutions, that the species X$_{1.47}$ can be assigned to a kind of OH. radical surface adduct. (25 refs.)

102962 Excitation frequency dependence of electroluminescence spectra in ZnS: ErF$_3$, YbF$_3$ thin films. R.Nakano, H.Kawasaki, J.Sato, T.Yabumoto (Dept. of Electronics, Meiji Univ., Kawasaki, Japan).
Oyo Buturi (Japan), vol.52, no.5, p.459-61 (May 1983). In Japanese.
The emitting color changed from green to red with increasing frequency in an In$_2$O$_3$: SnO$_2$-Y$_2$O$_3$-ZnS: ErF$_3$, YbF$_3$-Y$_2$O$_3$-Al structure thin film electroluminescent device. The energy transfer process from Yb^{3+} ion to Er^{3+} ion and emission transition processes in electroluminescence are discussed. (7 refs.)

102963 The electro- and photoluminescence spectra of oxide films formed during anodic oxidation of zinc. R.Dragon (Inst. of Math. & Phys., Higher School of Engng., Opole, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.47-54 (1983).
The distribution of intensity in the stationary anodic electroluminescence spectrum of zinc electrodes has been determined and compared with the photoluminescence spectrum of dried anodic zinc oxide films formed in the same electrolyte. It has been found that the anodic electroluminescence spectrum has its maximum in the green region (520 nm), whereas the photoluminescence spectrum of dried oxide films is in the yellow (580 nm). A hypothesis explaining the appearance of both spectra in different parts of the visible spectral region has been suggested. (25 refs.)

78.60H Cathodoluminescence, ionoluminescence

102964 Cathodoluminescence from deformed CaO. J.Llopis (Dept. de Fisica del Estado Solido, Univ. Complutense, Madrid, Spain), J.Piqueras.
J. Appl. Phys. (USA), vol.54, no.8, p.4570-2 (Aug. 1983).
The cathodoluminescence (CL) emission from deformed and undeformed CaO single crystals has been studied in the scanning electron microscope. Deformation enhances the emission which appears, in the CL image, localized in the deformed regions of the crystal. The CL spectrum depends on the kind of deformation applied to the crystal and is unstable under the electron beam. The results are discussed in terms of impurities and of vacancy defects generated during the plastic deformation. (13 refs.)

78.60K Thermoluminescence

102965 Thermoluminescence in borate glass containing copper. Y.Fukuda (Osaka Industrial Univ., Nakagaito, Daito, Japan), T.Okuno, N.Takeuchi.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.437-40 (Aug. 1983).
The authors studied the possible enhancement of thermoluminescent output of borate glass with the addition of $CuCl_2$. The Cu ions acted as recombination centres and encouraging results were obtained. (5 refs.)

102966 Thermoluminescence of X- or γ-irradiated KI and KI(Ca^{2+}) crystals. E.Rzepka, J.L.Doualan, L.Taurel (Lab. de Phys. Cristalline, Univ. de Paris Sud, Orsay, France).
J. Phys. C (GB), vol.16, no.24, p.4769-77 (30 Aug. 1983).
The thermal glow peaks obtained in undoped KI and KI:Ca^{2+}, when they are X- or γ-irradiated in the temperature range 100-300K, arise from the recombination of isolated F centres and the products of decomposition of either polyiodide ions or I_2 crystalline aggregates induced by the ionising radiations. The structure of the traps of interstitial atoms was determined by Raman light scattering studies. All the results confirm that the emission of light involves recombination of F centres and the transient interstitials released from their traps, probably located near the F centres in the case of KI:Ca^{2+}. No direct recombination occurs between interstitial atoms and potassium colloids, but it does not occur via the evaporated F centres from the colloids. (23 refs.)

102967 Thermoluminescence of mixed yttrium-lutetium scandade crystals doped with neodymium. V.A.Antonov, P.A.Arsenev, Kh.S.Bagdasarov, D.I.Korolev, A.M.Kevorkov (Inst. of Energetics, Moscow, USSR), W.Jelenski, A.Niklas, J.Wiechula.
Opt. Appl. (Poland), vol.13, no.1, p.69-73 (1983).
Deals with the effect of lutetium, yttrium and neodymium on the thermoluminescence (TL) of the neodymium-doped mixed yttrium-lutetium scandades after X-ray excitation at the liquid nitrogen temperature (LNT). Single crystals were grown by the method of optical zones in an air atmosphere. The stoichiometric composition of the investigated samples was the following: $Lu_{0.4}Y_{0.55}Nd_{0.05}ScO_3$, $Lu_{0.4}Y_{0.59}Nd_{0.01}ScO_3$ and $Lu_{0.4}Y_{0.595}Nd_{0.595}ScO_3$. The sample containing the greatest amount of neodymium shows only one maximum at temperature of 210K; characteristic of all the samples containing Nd^{3+}-ions. Due to the overlapping with the other maxima, the position of the maximum ascribed to the presence of Nd^{3+}-ions can be slightly changed for samples with different chemical composition. The TL curves for remaining samples display also the maxima characteristic of pure $LuScO_3$ and $YScO_3$. Increasing amounts of Lu^{3+}-ions leads to the appearance of the TL maximum in the vicinity of 170K, i.e. at the temperature at which there occurs the strongest maximum of TL for pure $LuScO_3$ crystals. With the increasing content of neodymium, the location of the high-temperature TL peak ascribed to the presence of Nd changes from 230K to 210K. (8 refs.)

102968 Vacuum-UV absorption and thermoluminescence of X-rayed quartz crystals. H.J.Bernhardt.
Phys. Status Solidi a (Germany), vol.78, no.1, p.61-7 (16 July 1983).
The connection is investigated between the thermoluminescence centres and the X-ray absorption centres which absorb in the near-edge region of synthetic quartz crystals of various defect types. (9 refs.)

102969 Thermoluminescence of n-GaAs. C.De Blasi (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy), C.Manfredotti, G.Micocci, A.Tepore.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K31-4 (16 July 1983).
The authors report for the first time thermoluminescence measurements performed on n-GaAs single crystals grown by the Bridgman-Stockbarger method. The samples are excited at room temperature by using a deuterium lamp. Several methods are available for deriving the activation energy of centres from the experimental curves. To analyse the results they have chosen the methods due to Hoogenstraaten (1958), Garlick and Gibson (1948), Chen (1969), and Grossweiner (1953). (9 refs.)

102970 On the general-order kinetics in thermoluminescence. N.Takeuch (Faculty of Technol., Kanazawa Univ., Kanazawa, Japan).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K93-6 (16 July 1983).
Recently Moharil (1982) has criticized the 'general-order kinetics' reported by May and Partridge (1965). Instead, he has proposed the usefulness of the ratio A/B appearing in the Antonov-Romanovskii equation (1951) where A is the probability of retrapping and B the probability of recombination. Two special cases are obtained, i.e. when $A=B$ the second order kinetics, and when $A \ll B$ the first order kinetics. The author states that the importance of the total concentration of traps (N) cannot be disregarded. Then, it should be corrected that when $AN \gg (B-A)n$ the second order kinetics is obtained and when $AN \ll (B-A)n$ the first order kinetics is obtained. (10 refs.)

102971 Thermoluminescence, fluorescence and electron paramagnetic resonance properties of synthetic hydrothermal scheelites. R.Caruba (Lab. de Geologie-Geochimie, Univ. de Nice, Nice, France), P.Iacconi, J.F.Cottrant, G.Calas.
Phys. & Chem. Miner. (Germany), vol.9, no.5, p.223-8 (1983).
Hydrothermal scheelite was synthesized using $Na_2WO_4.2H_2O$ mixed with $CaCl_2.H_2O$, $CaSO_4.2H_2O$ or CaF_2 at different temperatures (270-720°C) and 10^8 Pa. The morphology of the crystals depends on the starting products. The observed faces include the $\{112\}$, $\{114\}$, $\{011\}$, and $\{013\}$ forms. Pure or REE doped scheelites were studied by thermoluminescence (TL), fluorescence and electron paramagnetic resonance (EPR). The main TL peaks are located near 88, 149, 216, 277, and 315K. Results obtained with EPR or optical fluorescence have been correlated with TL measurements and show that the trivalent lanthanide elements substitute for calcium ions without site distortion. The differences in TL observed between Eu and the other doping elements are related to the greater stability of Eu^{2+} caused by X-irradiation. (25 refs.)

102972 Measurements of the emission spectra of LiF during thermoluminescence. P.D.Townsend, K.Ahmed, P.J.Chandler, S.W.S.McKeever, H.J.Whitlow (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Radiat. Eff. (GB), vol.72, no.1-4, p.245-57 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Studies of the emission spectra during thermoluminescence were analysed for various specimens of LiF:Ti and LifF:Mg,Ti. These suggest that the luminescence centre is a defect complex of Ti modified, in the Mg doped crystals, by Mg in various forms. The dependence of the TL peaks on dose and LET support the suggestion that the higher temperature peaks are complexes which trap more than one charge. Red emission is observed in Mg doped crystals. (36 refs.)

102973 Thermoluminescence in systems not subject to the usual approximations for first and second order kinetics. P.W.Levy (Brookhaven Nat. Lab., Upton, NY, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.259-64 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The properties of thermoluminescence (TL) glow curves have been studied in systems containing one or more glow peaks, not restricted to the assumption used to derive the usual first and second order glow peak kinetic expressions. If retrapping is negligible first order glow peaks are obtained whose peak temperature and shape are independent of other factors such as initial trapped charge concentrations. If retrapping occurs, glow peaks are obtained that are, in most cases, only approximated by first or second order kinetics. Also, in these cases, the peak temperature, shape, relative intensity and other glow curve characteristics depend strongly on initial trapped charge concentrations, recombination and retrapping cross sections and other factors. 78.65 OPTICAL PROPERTIES OF THIN FILMS

102974 Optical absorption of transition metal ions in silica coating films prepared by the sol-gel technique. S.Sakka, K.Kamiya (Faculty of Engng., Mie Univ., Mie, Japan), K.Makita, Y.Yamamoto.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.395-6 (Aug. 1983).
The state of transition metal ions in SiO_2 glasses prepared by the sol-gel technique has been examined by measuring the optical absorption spectra. The concentration of Mn^{3+} and Fe^{3+} was found to be higher in glass prepared by this technique than in glass prepared by the high temperature technique. (8 refs.)

102975 Photoinduced changes in optical properties of yellow arsenic. A.I.Sazonov, R.I.Kalendarev.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.35-40 (1983). In Russian.
Presents results obtained in studying photoinduced changes in optical properties of thin evaporated films of the molecular form of arsenic—yellow arsenic (y-As). It is shown that reduction in optical gap width effect of illumination is connected with formation clusters of a new phase in the y-As matrix. These clusters, in their turn, exert an effect on the matrix. In the case of limiting illumination it has been ascertained by means of Raman spectroscopy that the photoinduced process leads to short order changes in y-As. The state that is thus formed is close in properties and structure to amorphous arsenic (a-As), obtained by passing the y-As stage. Certain discrepancies in optical properties are, most likely, due to certain deviations in the positions of atoms situated at larger than next-neighbour distances, as well as to the formation of a looser net-like structure. (16 refs.)

102976 Optical and electrical properties of RF-sputtered indium-tin oxide films. J.Szczyrbowski (Dept. of Solid State Phys., Acad. of Mining & Metallurgy, Cracow, Poland), A.Dietrich, H.Hoffmann.
Phys. Status Solidi a (Germany), vol.78, no.1, p.243-52 (16 July 1983).
The electrical and optical properties of two series of RF-sputtered In_2O_3/SnO_2 films are investigated. One series is sputtered onto substrates which are held at room temperature and the second series onto substrates heated to 300°C. The oxygen partial pressure of the sputter gas is varied from 1×10^{-3} to 0.1 Pa in both the cases. The analysis of the optical measurements shows that the films are optically inhomogeneous and that this inhomogeneity depends on both the substrate temperature and the oxygen partial pressure during the deposition. The behaviour of the absorption coefficient near the fundamental absorption edge suggests that there are three different transition energies for electrons, which depend on the oxygen pressure during the preparation. As a result of the optical measurements some information about the band structure of In_2O_3 is obtained. (14 refs.)

102977 Optical constants of amorphous hydrogenated carbon and silicon-carbon alloy films and their application in high temperature solar selective surfaces. D.R.McKenzie, N.Savvides, D.R.Mills, R.C.McPhedran (School of Phys., Univ. of Sydney, Sydney, NSW, Australia), L.C.Botten.
Sol. Energy Mater. (Netherlands), vol.9, no.1, p.113-26 (May-June 1983).
A study was made of the alloy series a-$Si_xC_{1-x}H_y$ for $1 \geq x \geq 0$ prepared by a DC magnetron glow discharge in argon/silane/acetylene mixtures. Optical constants of a-CH_y and a-$Si_xC_{1-x}H_y$ for three values of x were determined. The changes in the optical constants caused by heat treatment at 500°C in vacuum were investigated. Solar selective coatings with exceptionally low emittance and good high temperature stability were studied theoretically and experimentally using both single layer and multilayer coatings. A stagnation temperature of over 500°C with no concentration was predicted for some coatings and in preliminary experiments 480°C was attained. (26 refs.)

102978 Influence of annealing temperature on the exponential absorption edge of thin Si:H amorphous films deposited by 'glow discharge'. J.M.Berger, F.De Chelle, J.P.Ferraton, A.Donnadieu (Lab. de Spectroscopie II, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Thin Solid Films (Switzerland), vol.105, no.2, p.107-13 (15 July 1983). In French.
Optical measurements of the absorption edge were performed on undoped and phosphorus-doped amorphous hydrogenated silicon (a-Si:H) films prepared by glow discharge and annealed at increasing temperatures. The authors observed exponential absorption edges (Urbach tails) $\alpha=\alpha_0\exp\{(E\text{-}E_1)/E_0\}$; the parameter E_0 increases with annealing temperature and is linearly related to the optical gap E_g. An explanation of these changes is proposed based on structural modification of the material. A similar study of diffused a-Si:H thin films shows that the value of the parameter E_0 is dependent more on the roughness of the surface than on the hydrogen content. (14 refs.)

102979 The effect of shielded Coulomb interaction on light absorption in thin semiconductor films. K.H.Aharonian, E.M.Kazarian (Yerevan Polytech Inst., Yerevan, Armenian SSR).
Thin Solid Films (Switzerland), vol.105, no.2, p.149-56 (15 July 1983).
The effect of shielded Coulomb interaction on the absorption of light in thin semiconductor films is investigated theoretically. Taking into account the field of charge carriers in the media surrounding the film, the authors obtain in an explicit form the potential of shielded Coulomb interaction with a two-dimensional Debye shielding radius. An analytical expression for the factor determining the contribution of exciton effects to the optical absorption is also obtained. Plots of the dependence of the exciton factor on the shielding radius and on the energy of the created pair are given, the plots being obtained numerically. (8 refs.)

102980 The optical properties of $AgInTe_2$ thin films. R.Vaidhyanathan, S.L.Pinjare, J.Sobhanadri (Dept. of Phys., Indian Inst. of Technol., Madras, India).
Thin Solid Films (Switzerland), vol.105, no.2, p.157-62 (15 July 1983).
The optical absorption in electron-beam-evaporated $AgInTe_2$ thin films was studied in the energy range 0.5-2 eV. $AgInTe_2$ was found to be a direct gap semiconductor with a room temperature gap of 1.03 ± 0.01 eV. Another direct transition observed at 1.04 ± 0.01 eV was ascribed to an optical transition from the crystal-field-split valence band to the conduction band minimum. A third direct allowed transition from the spin-orbit-split valence band to the conduction band was identified at 1.77 ± 0.03 eV. An estimate of the p-d hybridization of the uppermost valence yields a value of about 15%. (14 refs.)

102981 Optical absorption of transition element oxide-silica coating films prepared by sol-gel method. Y.Yamamoto, K.Makita, K.Kamiya (Matsuzaka Res. Center, Central Glass Co. Ltd., Taki-gun, Japan), S.Sakka.
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.222-9 (1983). In Japanese.
The valence and coordination of the transition element in the transition element oxide-silica coating films were examined by measuring the optical absorption spectra and compared with those found in silica glass containing a transition element oxide prepared by Schultz by flame-hydrolysis at high temperatures. The following results were obtained: (1) The maximum possible content of a transition element oxide for obtaining a homogeneous film was 10 mol.% for Cr_2O_3, 20 mol.% for Mn_2O_3, 45 mol.% for Fe_2O_3, 45 mol.% for CoO, 55 mol.% for NiO and 45 mol.% for CuO. The optical transmittance at 555 nm of the homogeneously colored 0.2-0.5 μm thick films with the strongest absorption was 81% for Cr, 68% for Mn, 63% for Fe, almost 0% for Co, 59% for Ni and 95% for Cu. (2) The valence and coordination of a transition element in the films were similar to those found in silica glass prepared at high temperatures. However, the concentration of a transition element showing a certain valence and coordination was not equal to that found in silica glass prepared at high temperatures. It was found that chromium is present as Cr^{3+} in octahedral site, manganese as Mn^{3+} in octahedral site, iron as Fe^{3+} in octahedral site, cobalt as Co^{2+} in tetrahedral site, nickel as Ni^{2+} in octahedral site and copper as Cu^{2+} in octahedral site. 78.70 OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION

102982 Vacuum polarisation and electron screening effects on leptonic bremsstrahlung. L.Chatterjee (Dept. of Phys., Jadavpur Univ., Calcutta, India), S.Bhattacharyya, T.Roy.
Indian J. Phys. Part B, vol.57B, no.1, p.85-8 (Feb. 1983).
Bremsstrahlung radiation of high energy leptons in their passage through matter has been investigated, taking the vacuum polarisation and electron screening effects directly into account and using second order interaction in quantum electrodynamics. (8 refs.)

102983 Differential incoherent scattering cross sections of 661.6 keV gamma rays in elements derived from differential incoherent scattering cross sections in compounds. A.H.Shivananda, T.K.Umesh, S.Gopal, B.Sanjeevaiah (Dept. of Phys., Univ. of Mysore, Mysore, India).
J. Phys. B (GB), vol.16, no.15, p.2753-8 (14 Aug. 1983).
Differential incoherent scattering cross sections of 661.6 keV gamma rays in the solid compounds NaCl, $NaNO_2$, KCl, NiO, $NaNO_3$, CuCl, NaBr, $CaCO_3$, $CaCl_2$ and $ZnCl_2$ and in the liquid compounds H_2O and HCl at 30, 45 and 60° have been measured. Making use of the bonded hydrogen incoherent scattering functions of Hubbell et al. and the mixture rule, the differential incoherent scattering cross sections in C, N, O, Cl, Na, K, Ca, Br, Ni, Cu and Zn are derived, compared with the theoretical values of Hubbell et al. and discussed. (15 refs.)

102984 Evidence for the tetravalence of cerium in $CeRu_2$. E.Wuilloud, Y.Baer (Inst. de Phys., Univ. de Neuchatel, Neuchatel, Switzerland), M.B.Maple.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.65-9 (8 Aug. 1983).
The conventional analysis of XPS core level spectra of $CeRu_2$ yields a picture of the 4f states which is difficult to reconcile with other results. The validity of this kind of interpretation urgently needs to be re-examined critically. In contrast, Bremsstrahlung isochromat spectroscopy (BIS) measurements on $CeRu_2$, reported herein, suggest that Ce is nearly tetravalent $4f^0$ configuration in this compound. (28 refs.)

102985 Calculation of the Compton profile of beryllium. M.Y.Chou, P.K.Lam, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1696-700 (15 Aug. 1983).
A calculation of the Compton profiles of beryllium is presented. The wave functions are obtained from an ab initio calculation with the use of the pseudopotential approach within the local-density-functional approximation. The calculated anisotropic profiles are in excellent agreement with experiments. The directional profiles are also in good agreement except for a small discrepancy which can be improved by the inclusion of the effects of correlation in an approximate way. (23 refs.)

102986 Radiation of a stationary charge under instantaneous change of the gyrotropy of a medium. V.A.Davydov, V.V.Kolesov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.31-4 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.35-9 (1982).
The authors consider the radiation of a stationary charge under an instantaneous change of the gyrotropy of a medium. They obtain the expressions for the spectral and angular distribution of the radiative energy. (7 refs.)

78.70B Positron annihilation

(see also 71.65 Positron states)

102987 Positron annihilation in and compressibility of water-organic mixtures. I. The system water-tetrahydrofuran. K.Jerie, A.Baranowski, B.Rozenfeld (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland), S.Ernst, J.Glinski.
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.77-92 (July 1983).
The results of measurements of ultrasound velocity and average positronium lifetimes in aqueous tetrahydrofuran solutions were shown to reflect the peculiar behaviour of the solution structure on the organic component concentration. The results indicate the formation of clathrate-like structures in the dilute solutions under test, while at higher concentrations of the organic component tendency of water to engage in THF-H_2O complexes becomes pronounced. (44 refs.)

102988 Annihilation of positrons trapped at metal surface and possibility of occurrence of asymmetry in angular distributions of annihilation quanta under the influence of an external electric field. B.Rosenfeld, K.Jerie, W.Swiatkowski (Inst. of Experimental Phys., Wroclaw Univ., Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.93-105 (July 1983).
A phenomenological, quantum-mechanical model of the annihilation of the positrons trapped at a metal surface is proposed. The model takes into account effects related to the interference of the electron waves incident and reflected from the metal-vacuum boundary. Conclusions drawn from the study of the scattering of the electron wave from the trapped positron deserve special attention. They indicate that the scattering process can cause an asymmetry in the distribution of the perpendicular (to the metal surface) component of the resultant momentum of the annihilation photon pair. Such asymmetry can also manifest itself in samples which contain voids, as a result of positron drift at the void surface under the influence of the applied electric field. An attempt is made to explain, in this way, the influence of the electric current flow in some metallic samples on the behaviour of the angular distributions of the annihilation photons. (14 refs.)

102989 Positrons and solid state physics. A.A.Manuel (Dept. of Phys., Univ. of Geneva, Geneva, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.437-48 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Positron annihilation (PA) is used for many purposes in solid state physics. The author outlines the principles of this method and illustrate how positrons are used to study problems as different as particle diffusion through a solid, defects in crystals and amorphous materials, electron momentum distributions, Fermi surface measurements or surfaces states. (56 refs.)

102990 A positron study of Guinier-Preston zones and precipitates in Al-Zn alloys having Mg or Ge additions. G.Dlubek (Sektion Phys., Martin-Luther-Univ. Halle/Wittenberg, Halle, Germany), O.Brummer, R.Krause, A.Baranowski, B.Rozenfeld.
Phys. Status Solidi a (Germany), vol.78, no.1, p.217-28 (16 July 1983).
Positron studies on Al-Zn (3 and 6 at.%) alloys having a Mg or Ge addition with a value between 0 and 1.5 at.% are reported, utilizing measurements of the positron lifetime τ as well as of the curve-shape parameters S and the peak height h of the 2γ-angular correlation curve. The samples are aged at room temperature or time-linear heated after their quenching. Strong evidence is found that positrons are trapped in Al-Zn-Mg by defect-free GP zones containing 70 at.% Zn as well as by vacancies inside of a second type of GP zones containing Zn and Mg. With increasing Mg content of the alloy the second type of GP zones dominates more and more over the first one. The results for Al-Zn-Ge are interpreted assuming positron trapping by both, defect-free Zn-rich GP zones and incoherent Ge precipitates. Whereas the Ge addition to the Al-Zn alloys affects only weakly the dissolution temperature of Zn-rich GP zones at about 100°C, in the Al-Zn-Mg alloys new types of GP zones and precipitates are observed. The behaviour of the peak height h

at 200 to 250°C indicates the formation of semicoherent η'- and incoherent η-precipitates. Some general experiences on the use of different measuring techniques of the positron method (τ or S and h) in studying precipitation phenomena in Al alloys are reported. (32 refs.)

102991 Correlation of dielectric relaxation and positron annihilation in glass-forming liquids. B.D.Malhotra, R.A.Pethrick (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).
Phys. Rev. B (USA), vol.28, no.3, p.1256-62 (1 Aug. 1983).
Dielectric relaxation measurements are reported on bis[m-(m-phenoxy) phenoxyphenyl] ether from room temperature (298K) down to its glass transition temperature (213K). Combination of these data with orthopositronium annihilation measurements published earlier indicate that the higher-temperature elbow in the latter data (T_r) coincides with the temperature at which the orthopositronium lifetime τ_3 is comparable with the bipolar relaxation time. A similar correlation is observed for ortho-terphenyl. With the use of ultrasonic velocity data, it is possible in the latter system to compute a mean cavity dimension and discuss the way in which the dynamic behavior of the supercooled liquid influences the positron annihilation behavior. The implications of these observations in terms of theories in viscous liquids are discussed. (24 refs.)

102992 On a site-selective EXAFS experiment using optical emission. J.Goulon (Interactions Moleculaires, Univ. de Nancy I, Vandouevre les Nancy, France), P.Tola, M.Lemonnier, J.Dexpert-Ghys.
Chem. Phys. (Netherlands), vol.78, no.3, p.347-56 (1 Aug. 1983).
X-ray-excited optical luminescence (XEOL) is known to offer an alternative detection scheme of EXAFS spectra. Although this secondary emission appears restricted to a rather limited number of systems, the authors show that it can afford, under appropriate circumstances, an interesting property of site selectivity. The case of a ZnO+ZnTPP mixture was chosen as an illustrative example. The relevant formulation of the phenomenon for powdered samples is developed and the requirements for site selectivity are discussed. (33 refs.)

102993 Study of variation of chemical shift using surface effects, electron-electron interaction and geometry of specimen. O.K.Harsh, Y.D.Kaushik, R.P.Sharma (Dept. of Post-graduate Studies & Res. in Phys., Feroze Gandhi Coll., Rae Bareli, India).
Indian J. Phys. Part B, vol.57B, no.1, p.76-9 (Feb. 1983).
Simple method is proposed to explain the chemical shifts in X-ray absorption edges of certain metal-compounds, which includes the effect of various interactions due to roughness of specimen. For this the authors used the collective method of electronic interactions. The calculated values are found in fair agreement with the experimental values of several workers. (17 refs.)

102994 Collective oscillations in the X-ray absorption spectrum of beryllium. O.K.Harsh, Y.D.Kaushik (Dept. of Post-graduate Studies & Res. in Phys., Feroze Gandhi Coll., Rae Bareli, India).
Indian J. Phys. Part B, vol.57B, no.1, p.89-91 (Feb. 1983).
It has been claimed that the fine structure in beryllium observed at an energy distance of 20.5 eV is due to plasma oscillations. The authors compared the transition probability obtained due to plasma oscillations in solids to that obtained by Kronig-Hayasi theory. It has been found that the transition probability for plasma oscillations in Be is greater than what Kronig-Hayasi theory predicts. (12 refs.)

102995 EXAFS study of bromomanganate ions in molten salts. E.D.Crozier, N.Alberding (Phys. Dept., Simon Fraser Univ., Burnaby, British Columbia, Canada), B.R.Sundheim.
J. Chem. Phys. (USA), vol.79, no.2, p.939-43 (15 July 1983).
Extended X-ray absorption fine structure spectra measurements were made on molten $(Bu_4N)MnBr_3$ to determine its coordination geometry which has remained in doubt because of its disproportionated structure in the solid form. Comparison with results on solid and molten $(Bu_4N)_2MnBr_4$ imply a Br to Mn coordination in $(Bu_4N)MnBr_3$ of 3.14 ± 0.36 at an average distance of 2.46 ± 0.03 Å. It is concluded that the nominal $MnBr_3$ moiety is, in fact, trigonal—a species previously unknown in liquids. The EXAFS of $(Bu_4N)_2MnBr_4$ give a Br-Mn bond length of 2.50 ± 0.02 Å when small corrections for an asymmetric pair distribution are included. The variation of the disorder parameter with temperature is in accord with measured asymmetric stretch frequencies of the $MnBr^{=}$ anion. No abrupt change in the disorder parameter of bond length occurs at the melting point. The near edge absorption spectra of both compounds are unexpectedly similar considering the difference in coordination numbers. (24 refs.)

102996 Extended X-ray absorption fine structure (EXAFS) of highly dispersed rhodium catalysts. G.H.Via, G.Meitzner, F.W.Lytle, J.H.Sinfelt (Exxon Res. & Engng. Co., Linden, NJ, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1527-9 (1 Aug. 1983).
An investigation was conducted of the extended X-ray absorption fine structure (EXAFS) associated with the K-absorption edge of the rhodium in two catalysts, Rh/SiO_2 and Rh/Al_2O, which contained 1 and 0.5 wt.% rhodium, respectively. Hydrogen chemisorption data indicated that the rhodium atoms were predominantly surface atoms in both catalysts. However, the EXAFS data indicated that the average number of nearest neighbor rhodium atoms about a given rhodium atom was much lower for the Rh/Al_2O_3 catalyst than for the Rh/SiO_2 catalyst, 1.5 compared to 9. These values compare with a value of 12 for metallic rhodium. Although the detection of at least some Rh-Rh coordination for the Rh/Al_2O_3 catalyst indicates that the rhodium is not present exclusively as single atoms bound to the alumina, the EXAFS data do not exclude the possibility that rhodium in this form could be present along with rhodium clusters. (17 refs.)

102997 An extended X-ray absorption fine structure spectroscopy study of a highly dispersed Rh/Al_2O_3 catalyst: The influence of CO chemisorption on the topology of rhodium. H.F.J.Van't Blik, J.B.A.D.van Zon, T.Hulzinga, J.C.Vis, D.C.Koningsberger, R.Prins (Lab. for Inorganic Chem., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
J. Phys. Chem. (USA), vol.87, no.13, p.2264-7 (23 June 1983).
The X-ray absorption spectrum of the Rh K edge of a highly dispersed reduced 0.57 wt.% $Rh/\gamma\text{-}Al_2O_3$ catalyst shows EXAFS oscillations due to rhodium-rhodium nearest neighbors, which proves the existence of rhodium metal crystallites. Adsorption of CO at room temperature on the reduced catalyst significantly decreases the amplitude of these EXAFS oscillations. This implies that CO adsorption on very small rhodium crystallites leads to a disruption of a significant number of the metal-metal bonds. (23 refs.)

102998 A study of the chemical shifts in X-ray absorption spectra and the sublattice distortion in some ternary chalcopyrite compounds of the type $CuMS_2$. A.P.Deshpande, V.B.Sapre, C.Mande.
Phys. Status Solidi b (Germany), vol.118, no.1, p.K39-42 (1 July 1983).
The chemical shifts in X-ray absorption spectra are found to be governed essentially by the environment of the absorbing atom, more particularly on the effective charge on it. An attempt has been made to find out if there exists any relationship between the chemical shifts and the sublattice distortions in the isostructural compounds of the type $CuMS_2$ (M=Al, Ga, In, Tl). (11 refs.)

102999 Spectroscopic standard for tetrahedrally coordinated ferric iron: γ $LiAlO_2{:}Fe^{3+}$. G.A.Waychunas (Center for Materials Res., Stanford Univ., Stanford, CA, USA), G.R.Rossman.
Phys. & Chem. Miner. (Germany), vol.9, no.5, p.212-15 (1983).
γ $LiAlO_2$ doped with Fe^{3+} in the tetrahedral site has been examined by extended X-ray absorption fine structure (EXAFS) analysis, and Mossbauer and optical spectroscopy. The isomer shift (IS) is −0.026 mm/s (Fe-Pd); the quadrupole splitting (QS) is 0.62 mm/s. Anisotropic optical absorption is prominent at ~391, 452, and 463 nm. The K-edge absorption spectrum shows a prominent absorption near 7.113 eV typical of tetrahedrally coordinated Fe^{3+}. (14 refs.)

103000 X-ray spectroscopic investigations of lead chloride, $PbCl_2$. C.Sugiura, Shun-ichi Nakai (Dept. of Appl. Phys., Utsunomiya Univ., Utsunomiya, Japan).
Phys. Rev. B (USA), vol.28, no.2, p.1088-92 (15 July 1983).
The Cl $K\beta$ emission and Cl K absorption spectra and the Pb M_V absorption spectrum from $PbCl_2$ have been obtained with a 50-cm bent-quartz-crystal vacuum spectrograph. The Cl $K\beta$ emission spectrum consists of a broad band. The Cl K absorption spectrum has two well-separated peaks just above the K edge. The first peak is regarded as the transition to the conduction-band minimum having p character, the second peak as the transition to the higher-lying p-like conduction band. The Cl $K\beta$ emission and Cl K absorption spectra of $PbCl_2$ are compared with the Cl $K\beta$ emission and Cl K absorption spectra of $BaCl_2$ reported previously, and interesting differences between them have been found. These differences are explained in terms of the ionicity and energy-band structures The Pb M_v absorption spectrum consists of two different kinds of structures: the two small peaks near the threshold and the intense broad absorption extending to the higher-energy region. The former peaks are ascribed to the transitions to the p-like conduction bands which arise from the $6p$ and $7p$ states of the Pb^{2+} ion, and the latter absorption is attributed to the $3d_{5/2}\rightarrow\epsilon f$ continuum transitions. 103001 Parametric X-rays from ultrarelativistic electrons in a crystal: theory and possibilities of practical utilization. V.G.Baryshevsky, I.D.Feranchuk (Dept. of Phys., Byelorussian State Univ., Minsk, Byelorussian SSR).
J. Phys. (France), vol.44, no.8, p.913-22 (Aug. 1983).
The detailed theory of parametric X-rays from charged particles in a crystal is considered. It is shown that this radiation is due to the diffraction of the particle's electromagnetic field. Some features of the parametric X-ray allows us to separate this radiation from other radiation types. Methods of the experimental investigation and uses of parametric X-rays are discussed. 103002 Microwave absorption of magnetic dielectrics. S.Yamaguchi (Yamaguchi-Lab., Tokyo, Japan).
Mater. Chem. & Phys. (Switzerland), vol.8, no.6, p.579-82 (June 1983). In German.
A simulation is made for demonstrating that a magnetic dielectric emulsion prepared by the tribophysical procedure is able to absorb microwaves with a wavelength of about one mm. In this emulsion the iron alloy and the barium titanate particles are evenly dispersed. This emulsion is compared to a closed electric circuit consisting of solenoid and condenser. (3 refs.)

103003 Submillimeter transmission spectra of mosaic samples. A.A.Volkov, G.V.Kozlov, S.P.Lebedev.
Opt. & Spectrosc. (USA), vol.54, no.1, p.61-3 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.107-10 (Jan. 1983).
The effect of the spacing between the units, the orientation of the electric wave field vector relative to the interval line, and the dielectric parameters of the units on the transmission spectra of mosaic samples was investigated by the method of submillimeter LOV spectroscopy. The typical characteristics of distortion of the spectra by parasitic radiation passing through the gaps were evaluated. (5 refs.)

103004 Microwave absorption in amorphous chalcogenide semiconductors. K.Shimakawa (Dept. of Electronics, Gifu Univ., Gifu, Japan).
Philos. Mag. B (GB), vol.48, no.1, p.77-85 (July 1983).
Although the AC conductivity of amorphous chalcogenides in the radio frequency region has been well interpreted by the combined mechanism of correlated barrier hopping (CBH) of bipolarons and single polarons based on charged defects, it is not clear whether the CBH model can be extended to the microwave region. The validity of the CBH of bipolarons with regard to both the frequency and temperature dependencies of conductivity is examined in the microwave region. It is concluded that the observed microwave optical absorption (conductivity) is well interpreted in terms of the CBH of bipolarons for glassy Se, As_2Se_3, As_2S_3, As_2Te_3, $(As_2Te_3)_{1-x}Ge_x$ and Tl_2SeAs_2Te. (22 refs.)

103005 Anomalously small dissipation of electromagnetic waves in an ionic crystal. V.B.Braginskii, V.I.Panov, A.V.Timashov (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.926-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.74-5 (Nov. 1982).
The study of the dissipation of electromagnetic waves in dielectric crystals permits valuable information to be obtained on the polarization mechanisms. Such mechanisms are interesting also because at the present time there is no complete theory which would permit prediction of the loss tangent tan δ of an electromagnetic wave in a crystal of known composition and structure. The authors report measurements of the quality factor (Q_e) values of disk resonators made of sapphire. (6 refs.)

103006 Nonlinearities of laser heating of metals. N.N.Rykalin, A.A.Uglov, I.Yu.Smurov (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.970-2 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.377-81 (Nov. 1982).
Three-dimensional problems of the laser heating of metals with partial allowance for nonlinearities has been examined. Simultaneous allowance has been made for all nonlinearities (the absorptivity, the thermal conductivity, and volume heat capacity), which are inherent to the process of laser heating of metals. It has been shown that the combined effect of the nonlinearities leads, in a number of cases, to substantially new results. The authors examine the heating of a semi-infinite body by a moving laser beam. The calculations that have been carried out showed that, during the laser heating of molybdenum and of tungsten, one cannot select constant values of the absorptivity and of the thermophysical coefficients such that the linear model describes the heating process in an acceptable way over the entire temperature range from the initial temperature to the melting temperature, since the discrepancies will be large either at low or at high temperatures. (6 refs.)

103007 Calculation of heating of metals by continuous laser radiation in an oxidizing atmosphere. A.A.Uglov, I.Yu.Smurov, A.A.Volkov (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.154-6 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.289-94 (Feb. 1983).
A study is made of a nonsteady problem of heating of metals by continuous laser radiation allowing for a chemical reaction on the surface of a metal plate. The dependence of the absorptivity of the target on the thickness of the oxide film formed on the metal surface is also allowed for. Approximate analytic expressions are obtained for the dependences of the metal temperature on time and on the oxide film thickness, and also for the time dependence of this thickness during heating. It is shown that it is essential to allow for the nonlinearity of the process in calculation of the heating of metals by laser radiation on oxidizing atmosphere. (15 refs.)

103008 Temperature dependence of the absorptivity of aluminum targets at the 10.6 μ wavelength. V.I.Konov, V.N.Tokarev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.177-80 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.327-31 (Feb. 1983).
The temperature dependence of the absorptivity $A(T)$ of aluminum targets was determined experimentally at the 10.6 μ wavelength in the temperature range $20 \leq T \leq 780°C$. An abrupt change in $A(T)$ was observed on passing through the melting point. It is found that when the initial value of $A(T)$ (at room temperature), which depended on the state or the surface, decreased, the slope dA/dT also decreased. The experimental data were compared with calculations of $A(T)$ allowing for a slightly anomalous skin effect for aluminum under these conditions. (12 refs.)

103009 Ion and electron spectroscopy during pulsed laser irradiation of silicon. J.P.Long, R.T.Williams, T.R.Royt, J.C.Rife, M.N.Kabler (Naval Res. Lab., Washington, DC, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.89-95
Ion mass spectrometry, charged particle yields, and kinetic energy distributions of electrons and ions are used to characterize silicon wafers and vacuum-cleaved silicon surfaces under conditions related to laser annealing. The authors find that alkali metals dominate the positive ion emission from chemically-cleaned wafers, a mass-72 peak tentatively identified as Si_2O^+ comprises the main ion emission from the cleaved surface, and ion and electron temperatures can be derived from the energy distribution curves, although the Si_2O^+ emission implies more than a simple thermal evaporation process. (9 refs.)

79.20F Electron impact: Auger emission

103010 Auger lifetimes for excitons bound to deep impurities in semiconductors. M.Jaros, F.A.Riddoch, Lu Da Lian (Dept. of Theoretical Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Phys. C (GB), vol.16, no.21, p.L733-9 (30 July 1983).
It is shown that the Auger transition probability for excitons bound to deep neutral impurities cannot be derived by extrapolating the results obtained for the series of shallow donors and acceptors. Although the probability increases with localisation over the range of binding energies characteristic of hydrogenic impurities, the breakdown of the effective mass approximation in the case of deep levels greatly reduces the Auger probability. Exceptional situations where this may not be so are also predicted. (20 refs.)

103011 Resonant electron emission in heavily oxidized lanthanum. R.Hoogewijs, H.Lievens, L.Fiermans, J.Vennik (Lab. voor Kristallografie, Rijksuniv. Gent, Gent, Belgium).
Solid State Commun. (USA), vol.47, no.8, p.591-2 (Aug. 1983).
Electron-excited 4d Auger spectra of La and heavily oxidized La have been measured. A distinct peak, appearing just above the 4d excitation threshold in heavily oxidized La, is tentatively assigned to an interatomic autoionization process accompanying the 4d→4f giant resonance excitation. The absence of a similar peak in La metal is explained as being due to the very weak coupling between the 4f level and the metal valence band. (13 refs.)

103012 The Auger spectrum of lithium metal, lithium binary and lithium ternary compounds. I.F.Ferguson, D.R.Masters, B.F.Riley, M.Turek (Springfields Nuclear Power Dev. Labs., UKAEA, Preston, England).
Vide les Couches Minces (France), vol.38, no.217, p.279-88 (May-July 1983).
The authors investigated the Auger spectrum of metallic lithium as well as that of a number of simple lithium compounds so as to assess this possibility and determine whether an Auger microprobe can be used to detect and hence map at high spatial resolution lithium. In this way, the distribution of lithium could be determined in boron carbide which has been irradiated in a nuclear reactor and in which lithium has been formed by the fission reaction: ${}_5^{10}B + {}_0^1n \rightarrow {}_3^7Li + {}_2^4He$. Binary compounds of lithium with other elements in the same period of the Periodic Table; lithium halides; lithium hydride; and lithium sulphide were selected for study as well as certain lithium ternary compounds. These ternary compounds included lithium borohydride which was chosen because of the environment in which a fission produced lithium atom may find itself; lithium tetraborate picked by way of contrast; as well as lithium carbonate, lithium hydroxide and lithium chloride monohydrate, all of which are related chemically to some of the simple binary compounds selected and which could occur either on their surfaces or on that of irradiated boron carbide as impurities. (9 refs.)

103013 A computer controlled investigation of the electron energy spectra formed under electron bombardment during the early stages of the oxidation of iron. I.F.Ferguson, B.F.Riley (Springfields Nuclear Power Dev. Labs., UKAEA, Preston, England), R.Sopizet.
Vide les Couches Minces (France), vol.38, no.217, p.295-300 (May-July 1983).
The continuing development of Auger analysis requires that the experimental data should be capable of rapid and meaningful quantification using a dedicated computer. In some instances, a comparison has been made between quantitative data obtained using Auger data collected in derivative mode d[E.N(E)]/dE, and referred to standard Auger spectra and bulk compositions obtained by either X-ray fluorescence or chemical analysis. These results show that a satisfactory, but not exact, agreement can be obtained between the Auger analyses and the bulk analyses. The authors have therefore decided to investigate whether Auger data collected in direct mode, E.N(E), can be quantified more satisfactorily than those collected in derivative mode. The particular problem undertaken was to prepare a sample of pure iron and to oxidise it so as to determine how the electron spectrum (collected in direct, E.N(E) mode) varies during the early stages of oxidation. 103014 Auger electron and characteristic energy loss spectra for electro-deposited americium-241. M.N.Varma, J.W.Baum (Safety & Environmental Protection Div., Brookhaven Nat. Lab., Upton, NY, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.493-5 (1 July 1983).
Auger electron energy spectra for electro-deposited americium-241 on platinum substrate were obtained using a cylindrical mirror analyser. Characteristic energy loss spectra for this sample were also obtained at primary electron beam energies of 990 and 390 eV. From these measurements P_I, P_{II}, and P_{III} energy levels for americium-241 are determined. Auger electron energies are compared with theoretically calculated values. Minimum detectability under the present condition of sample preparation and equipment was estimated at approximately 1.2×10^{-8} g/cm^2 or 3.9×10^{-8} Ci/cm^2. Minimum detectability for plutonium-239 under similar conditions was estimated at about 7.2×10^{-10} Ci/cm^2. (2 refs.)

103015 Chemistry and physics of the surface of solid bodies. H.Ibach (KFA Julich, Julich, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.190-3 (July 1983). In German.
Scatter of slow electrons (20-100 eV) from molecules adsorbed at single crystal cleavage planes allows one to discriminate between scatter from dipoles and from collisions. The mean free path of about 0.5 nm of electrons of 20-100 eV is responsible for the high surface sensitivity in examining the surfaces of solid bodies. An electron spectrometer is described with 127° condensers for energy dispersion. With it the steric arrangement of the

hydrogen atoms of ammonia molecules which were adsorbed on a (110) plane of iron was found. Also, the change from ethylene adsorbed on platinum at 90K and its transition to ethylidine was revealed on heating the specimen to 300K. A number of intermediate decomposition products from a Fischer-Tropsch synthesis on an iron single crystal, such as carbine, methylidine, methylene, formyl, methoxy, and hydroxy groups were identified. The binding between adsorbed molecules near the surface of the adsorbent solid body and their relation to changes of volume of the solid body could be measured. (8 refs.) *R.S.*

79.20N Atom, molecule, and ion impact

103016 Temperature-dependent ion mixing and diffusion during sputtering of thin films of $CrSi_2$ on silicon. U.Shreter, R.Fernandez, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.247-9 (1 Aug. 1983).
Measurements of sputtering yields and composition profiles have been carried out using backscattering spectrometry for samples of $CrSi_2$ on Si irradiated with 200-keV Xe ions. When the $CrSi_2$ layer is thinner than the ion range, the sputtering yield ratio of Si to Cr increases from 3.5 for room-temperature irradiation to 65 at 290°C. For a thick sample, the corresponding increase is from 2.4 to 4.0 only. These changes are explained in terms of a rise in the Si surface concentration at 290°C. The driving force for this process seems to be the establishment of stoichiometric $CrSi_2$ compound. Transport of Si to the surface is by ion mixing in the thin sample and thermal diffusion through the thick layer. (11 refs.)

103017 Dose dependence in angular distributions of Ag and Au sputtered from an alloy target. M.R.Weller (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.419-26 (1 July 1983).
The angular distributions of silver and gold atoms sputtered from a Ag-Au alloy have been measured as a function of the fluence of incident particles. The alloy was sputtered using a 100 keV $^{40}Ar^+$ beam. Initially, Ag was preferentially sputtered at all angles. However, as the target surface approached its steady-state composition, the angular distribution of the sputtered Ag became more oblique while that of the sputtered Au remained essentially unchanged. Relative to the bulk alloy composition, the steady-state sputtered material was depleted in Ag in the direction of the surface normal, but remained enriched in Ag at oblique angles. This suggests the presence on the target of a very thin surface layer (at most a few monolayers thick) which is enriched in Ag relative to the composition of the well-documented Au-enriched layer which extends to a depth comparable to the range of the sputtering ion. (20 refs.)

103018 Inelastic energy loss in solids. II. Calculation of the number of ejected electrons on the basis of the expectation value of the inelastic energy loss. I.Nagy, J.Laszlo, J.Giber (Phys. Inst., Tech. Univ. Budapest, Budapest, Hungary).
Appl. Phys. A (Germany), vol.A31, no.3, p.153-5 (July 1983).
The dependence on the bombarding energy of the number of ejected electrons from a polycrystalline Ag target is determined. Statistical methods are used in the calculation of the inelastic energy loss due to binary atomic collisions and due to the electronic stopping cross-section. The calculation is executed for the case of Se^+ bombarding ion in the 10-200 keV energy range. (6 refs.)

103019 A time dependent wave packet approach to three-dimensional gas-surface scattering. G.Drolshagen, E.J.Heller (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2072-82 (15 Aug. 1983).
A time dependent wave packet approach to gas-surface scattering is presented. This semiclassical method is based on Gaussian wave functions whose average positions and momenta are those of classical trajectories. The initial states are represented as superpositions of Gaussian wave packets. These wave packets are propagated individually and after the collision, the scattering information is extracted by projecting them onto the final states in a coherent way, according to the initial expansion coefficients. The powerful new approach allows the treatment of surface imperfections as well as the inclusion of more degrees of freedom of the surface or the gas particle. The accuracy of the present semiclassical method is tested by a comparison with exact quantal calculations for He-LiF diffractive scattering and in most cases excellent agreement is found. In addition, the wave packet approach is used to calculate diffraction probabilities at high energies and to examine the interface structure of the scattered particles as a function of the size of the surface from which the scattering occurs. (46 refs.)

103020 Trapping and energy accommodation of atoms on metal surfaces. R.Brako (Rudjer Boskovic Inst., Zagreb, Yugoslavia).
Solid State Commun. (USA), vol.47, no.7, p.559-61 (Aug. 1983).
Expressions for the trapping and sticking probability and for the energy accommodation coefficient of atoms on metal surfaces are derived by using a Gaussian form for the distribution of the energy transfer. The results are in good agreement with recent numerical simulation calculations and experiments. (8 refs.)

103021 Ion survival probabilities for 3 keV He^+, Ne^+, and Ar^+ scattering from La and adsorbate covered La surfaces. R.Kumar, M.H.Mintz, J.A.Schultz, J.W.Rabalais (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.L311-16 (July 1983).
TOF spectra of scattered neutrals and ions for 3 keV He^+, Ne^+, and Ar^+ bombardment of La and adsorbate covered La surfaces show that the scattered ion fractions are 21.1% and 10.7% for Ar^+ on clean and adsorbate covered La, respectively, and $<1\%$ for all of the other systems. These results are consistent with a model in which Auger and resonant neutralization (AN and RN) transitions govern the ion survival probability. (18 refs.)

103022 The formation of striations on oblique boundaries during sputtering. G.Carter, M.J.Nobes, G.W.Lewis (Dept. of Electronic & Electrical Engng., Univ. of Salford, Salford, England), J.L.Whitton.
Vacuum (GB), vol.33, no.7, p.373-80 (July 1983).
The results of studies of the production of striations on boundaries inclined obliquely to incident sputtering ion flux are described. It is shown that two processes probably operate, one resulting from local shadowing of the substrate from ion flux by protection layers, the other resulting from the complex nature of the sputtering process in damaged crystalline solids. (34 refs.)

103023 Sputtering erosion of stratified media and by time dependent ion bombardment. M.J.Nobes, G.Carter, G.W.Lewis (Dept. of Electronic & Electrical Engng., Univ. of Salford, Salford, England), J.L.Whitton.
Vacuum (GB), vol.33, no.7, p.381-9 (July 1983).
The theory of the evolution of surface morphology resulting from ion bombardment induced sputter erosion (and other process) is generalized to include description of spatio-temporally variable ion flux, and substrate inhomogeneity. This allows discussion of effects associated with rotated or translated ion beams and substrates and of striated or stratified substrates such as occur in polycrystals or in the neighbourhood of extended defects or impuritiesin single crystals. Geometric reconstructions of several two-dimensional surface sections are undertaken in order to illustrate the analytical methods. (32 refs.)

103024 Workshop notes and short contributions. H.H.Andersen, B.J.Jeppesen, S.Olesen, B.Stenum, T.Sorensen, H.J.Whitlow.
Vacuum (GB), vol.33, no.7, p.411-12 (July 1983).
The presence of a segregated surface layer during sputtering has recently been demonstrated for binary metal alloys in both solid and liquid phases by in situ measurements of the angular distributions of sputtered atoms. In order to investigate the influence of target temperature on surface segregation during ion bombardment, the authors have developed an apparatus which facilitates measurement of the angular distribution of sputtering atoms by a collector technique for target temperatures up to 600°C. 79.40 THERMIONIC EMISSION

103025 Correlation between energy distribution of Sr^+ thermal ion and mass spectrometric thermal analysis for SrO-W system. T.Harada, M.Asano, K.Kubo.
Tech. Rep. Inst. At. Energy Kyoto Univ. (Japan), no.194, p.1-8 (Feb. 1983).
A correlation of energy distribution curves of Sr^+ thermal ions emitted from a SrO-W system with the result of mass spectrometric thermal analysis for the system has been investigated. The energy distribution curves have been obtained by the technique of electronic differentiation of retarding voltage curves in a method similar to LEED-Auger system with a four-grid optics. The curves obtained at various temperatures in the range 1570-1919K are found to be almost Maxwellian, except for 1842K where the curve is very broad. It is verified that the result at 1842K is due to the emission of Sr^+ thermal ions from the surfaces with various work functions. From the values of retarding voltages at the maximum of the energy distribution curves, changes in work functions of the surface, from where Sr^+ thermal ions are emitted are examined. The values of the work functions are widely changed with the chemical forms of the SrO-W system. (19 refs.)

103026 Assignment of emitting surfaces for thermal ions by their energy distributions. T.Harada, M.Asano, K.Kubo (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
Tech. Rep. Inst. At. Energy Kyoto Univ. (Japan), no.195, p.1-10 (March 1983).
The K^+ thermal ions emitted simultaneously from bare surface and partly coated polycrystalline tungsten ribbon surface with potassium nitrate have been discriminated by the measurement of the ion energy distribution curves. These curves have been obtained by electronic differentiation of retarding voltage curves. The assignment of emitting surfaces for the K^+ thermal ions has been made by comparison of retarding voltages at maxima of the energy distribution curves for K^+ thermal ions emitted from two separate polycrystalline tungsten ribbons with a wholly bare surface and a wholly coated one with potassium nitrate. (10 refs.)

79.60 PHOTOEMISSION AND PHOTOELECTRON SPECTRA

103027 Influence of crystalline perfection and surface species on the X-ray photoelectron spectra of natural and synthetic graphites. R.Schlogl, H.P.Boehm (Inst. fur Anorganische Chem., Univ. Munchen, Munchen, Germany).
Carbon (GB), vol.21, no.4, p.345-58 (1983).
Valence band and core level photoelectron spectra have been measured for a variety of natural and synthetic graphites. The valence band spectra confirm previous work, where the contamination influence by chemisorbed species was demonstrated. A linear correlation between the C 1*s* binding energy (b.e.) and the c_0 lattice constant as a measure of crystalline perfection was found. The line width is larger the more perfectly the graphite is crystallized, indicative of a relaxation effect. A characteristic satellite structure on the high b.e. side of the C 1*s* peak is due to the plasmon spectrum as well as to a large number of surface compounds. By comparison with b.e.s for discrete molecules, the satellites are associated with alcoholic or etheric, carbonylic and carboxylic surface oxides, and aliphatic and/or aromatic surface chlorides. The assignments are confirmed by variable-temperature XPS and by the products of thermal decomposition. Trace surface impurities of sulfur and nitrogen were found in many graphites. The relevance of these findings for XPS on graphite intercalation compounds is briefly discussed. (38 refs.)

103028 Experimental investigation of the mean free path of Pt($4f_{7/2}$)-photoelectrons. N.Wagner, O.Brummer (Martin-Luther-Univ., Halle-Wittenberg, Germany).
Exp. Tech. Phys. (Germany), vol.31, no.3, p.251-5 (1983). In German.
By means of a combined application of the saturation- and the absorption-method on a Pt/Au layer system the mean free path of Pt($4f_{7/2}$)-photoelectrons was estimated experimentally. The result is compared with theoretical values. It is also used to determine the Pt surface contamination and its removal by ion sputtering. (15 refs.)

103029 Angle-resolved photoelectron spectroscopy of the nickel magnetism below and above T_c. U.Gerhard (Phys. Inst., Univ. Frankfurt/Main, Frankfurt/Main, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.105-15 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Discusses the extraction of the exchange splitting of Ni from angle resolved UPS measurements. Results are obtained in both the ferromagnetic phase and the paramagnetic phase. The high temperature results are compared with the short range magnetic order model. (19 refs.)

103030 Photoemission studies of molecular beam epitaxially grown GaAs(001) surfaces exposed to a nitrogen plasma. S.Gourrier (Lab. d'Electronique et de Phys. Appl., Limeil Brevannes, France), L.Smit, P.Friedel, P.K.Larsen.
J. Appl. Phys. (USA), vol.54, no.7, p.3993-7 (July 1983).
GaAs(001) surfaces prepared in situ by molecular beam epitaxy (MBE) have been investigated by reflection electron diffraction, valence-band photoemission and core level photoemission after exposures to nitrogen plasmas. The nitridation leads to disordered surfaces. The Fermi level (E_F) which for the clean surface is situated at 0.4 eV above the GaAs valence-band maximum (VBM) shift as a function of the plasma exposure towards a saturation value of 1.1 eV above VBM. Strong nitrogen derived peaks are found in the valence-band spectra at energies 5 to 8 eV below E_F. As(3*d*) and Ga(3*d*) core level spectra show chemical shifts towards higher binding energies due to the nitridation. The shift is 0.7-0.8 eV for the Ga(3*d*) level. For the As(3*d*) level shifts in the range 1.4-2.2 eV are observed. The dependence of the chemical shifts and the linewidths on the plasma exposure and on subsequent heat treatments are explained by the presence of different As nitrides having different binding energies and volatilities, whereas only one Ga nitride (GaN) is formed by the nitridation. (13 refs.)

103031 Photoelectron energy distribution of Cs_3Sb. Chunghsin Lee (Thermo Electron Corp., Waltham, MA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4578-80 (Aug. 1983).
Photoelectron energy distributions from semitransparent Cs_3Sb photocathodes have been measured using a parallel plate analyzer. Argon-ion and helium-neon laers are used as light sources. The energy spread, defined as the full width at half-maximum of the distribution, is found to depend on the incident photon energy F_λ according to the empirical relation, $\Delta E(\mathrm{eV})=0.25\ E_\lambda(\mathrm{eV})-0.39$. It is shown that the photoelectron energy distributions vary with the emitted current density. (9 refs.)

103032 Resonant photoemission in transition-metal chlorides. A.Kakizaki, K.Sugeno, T.Ishii (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan), H.Sugawara, I.Nagakura, S.Shin.
Phys. Rev. B (USA), vol.28, no.2, p.1026-35 (15 July 1983).
In the chlorides of Ni, Co, Fe, and Mn, the resonance between the excitations of valence electrons and the 3*p* electrons of the metal ions is observed over the whole parts of the valence-band spectra including ligand-derived bands as well as satellites. The trend of the systematic change in satellite−to−main-band separations in going from $NiCl_2$ to $MnCl_2$ is opposite to that in the energies of charge-transfer excitons, and this is discussed in connection with the three overlapping bands approximately with Fano line shapes. The *q* value characterizing a Fano line shape is larger for satellites and ligand-derived bands than for the 3*d* bands of the metal ions. The resonant enhancements of the ionization cross sections of the main bands increase from $NiCl_2$ to $MnCl_2$. These aspects are interpreted in terms of the hybridization of the 3*d* orbitals of the metal ions in the 3*p* orbitals of the ligand ion. The ordinary $M_{2,3}VV$ super-Coster-Kronig bands are very weak. (37 refs.)

103033 Mechanism for the valence-band photoemission in Ni: inclusion of interatomic interactions. T.Aisaka (Faculty of General Education, Tottori Univ., Tottori, Japan), T.Kato, E.Haga.
Phys. Rev. B (USA), vol.28, no.2, p.1113-16 (15 July 1983).
In relation to the valence-band photoemission in Ni, the importance of interactomic interactions is proposed, on the basis of examinations of the correlation effect in the *T*-matrix approximation. Calculated results show that, in the presence of the interatomic interaction, both the bandwidth and the satellite binding energy become smaller than those in the Hubbard model. This property in the interatomic interaction enables the authors to explain consistently the experimental result. (8 refs.)

79.70 FIELD EMISSION AND FIELD IONIZATION

103034 Charge state of ions in liquid metal field ion sources. D.R.Kingham (Dept. of Appl. Phys. & Electrical Engng., Oregon Graduate Center, Beaverton, OR, USA).
Appl. Phys. A (Germany), vol.A31, no.3, p.161-4 (July 1983).
The post-ionization model of field evaporation is shown to be consistent with observations of singly and doubly charged ions in liquid metal field ion sources. The model can be used to estimate the field strength at the apex of the Taylor cone which is found to be 1.9-2.9 V/Å for a Ga source. Experiments to test the post-ionization model and to determine the apex field strength more accurately are suggested. A possible method of obtaining $\sim\mu$A currents of highly charged ions, e.g. Zr^{4+}, Ta^{4+}, Ga^{3+}, As^{3+}, is proposed. (22 refs.)

103035 Transverse electron focusing in the presence of nonstationary emitter currents. Yu.A.Kolesnichenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.753-6 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
This is a theoretical study of the transverse electron focusing in the presence of nonstationary emitter currents on the assumption that the contact size *b* is larger than the skin depth δ. It is shown that if the emitter voltage varies with the frequency ω larger, than the inverse time of the electron flight across the emitter neighbourhood $\omega_0{}^{-1}\simeq b/v_F$, then there is no focusing (v_F is the Fermi velocity). For frequencies $\sqrt{\Omega\omega_0}<\omega<\omega_0$ (Ω is the Larmor frequency of electron motion) the electron transverse focusing peak amplitude essentially depends on ω. (9 refs.)

103036 Influence of an electric field on the evaporation of Fe-Si, Fe-Mn and Fe-Al melts in helium. Experimental investigation. A.V.Kaybichev, B.M.Lepinskikh.
Russ. Metall. (GB), no.4, p.56-61 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.66-70 (1981). [received: June 1983]
Dilute elements have a determining effects on the evaporation of binary melts. The effect of an electric field on iron-silicon and iron-manganese melts is similar. Their ion emission proceeds in the case of positive polarity and its contribution increases with weakening of the bonds between the particles in the melts. Ion emission of iron-aluminium melts in helium occurs for negative polarity and an increase in the voltage is required with decreasing melting temperature. It is assumed that there are changes in the evaporated particles with the melt composition. (6 refs.)

79.75 EXOELECTRON EMISSION

103037 Investigations of mechanically induced excited states on cleavage planes of ionic crystals. II. Investigations of the mechanisms of electron emission from cleaved alkali halide crystals and of the influence of surface charges. J.Wollbrandt, U.Bruckner, E.Linke (Zentralinst. fur Physikalische Chem., Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.163-8 (16 July 1983).
For pt.I see ibid., vol.77, p.545 (1983). Using the apparatus for investigations of mechanically induced excited states, the electron emission from mechanically treated alkali halide crystals and their surface charge distribution is measured. While the spontaneous postemission (not depending on temperature below RT) of electrons after mechanical treatment can be explained as field emission from surface traps, the TSEE low-temperature glow peaks are ascribed to the decay of defect electron centres. A simple mechanism is suggested to understand the mechanically induced excitation process. Measurements of the locally resolved OSEE show the necessity to know the charge structure in order to interpret the emission relief properly. (15 refs.)

103039 Tellurium as melting medium to prepare transition metal chalcogenides single crystals. M.Spiesser, J.Rouxel (Lab. de Phys.-Chimie des Solides, Univ. de Nantes, Nantes, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1497-9 (30 May 1983). In French.
Tellurium is found to be an excellent melt to grow single crystals of second and third row transition metal tellurides and selenides. The procedure has been used successfully in the case of $MoTe_2$, WTe_2, $NbTe_4$, $ZrTe_5$, $HfTe_5$, $MoSe_2$, WSe_2, $TiSe_2$, $ZrSe_2$, $IrSe_2$ and $OsSe_2$. (6 refs.)

103040 Mathematical modelling of heat flow in Czochralski crystal pulling. A.B.Crowley (Dept. of Math. & Ballistics, Royal Military Coll. of Sci., Swindon, England).
IMA J. Appl. Math. (GB), vol.30, no.2, p.173-89 (March 1983).
A mathematical model of the heat flow in the holm region in crystal pulling by the Czochralski technique is developed. This is a moving boundary problem with two moving boundaries, the phase change surface and the air-liquid meniscus. Using the enthalpy method and coordinate transformation techniques, the problem is cast into a form suitable for numerical solution. A numerical scheme is outlined, and some results for the growth of germanium crystals are shown. (10 refs.)

103041 Device for shifting containers with crystallizing materials in a furnace for the growth of single crystals. W.Waclawek, B.Marciniak (Wyzszej Szkoly Pedagogicznej Czestochowie, Czestochow, Poland), T.Swierczynski.
Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.27-8 (Jan. 1983). In Polish.
Describes the construction and operation principle of a device for linear shifting of mechanism elements, particularly of containers with a crystallizing material in the process of single crystal growth, this device allowing a control and readout of both the shifting speed and position. Also discussed is the usefulness of the device in the single crystal growth process by Bridgman's method. (7 refs.)

103042 The synthesis of fluor-analogues of natural asbestos by unidirectional crystallisation. M.Campbell, P.S.Rogers.
Proc. Br. Ceram. Soc. (GB), no.33, p.63-77 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
Long fluor-amphibole fibres in parallel array have been successfully produced by unidirectional crystallisation of filaments drawn from the melt. These fluor-amphiboles are synthetic analogues of natural amphiboles with isothermal replacement of hydroxyl groups by fluorine, and can be compared with natural amphibole asbestos. The technique devised by Maries and Rogers consists of controlled drawing through an orifice in the base of a heated conical crucible. The synthetic fibres are well aligned but somewhat thicker than natural asbestos (about 50 μm against a few microns). In the case of fluor-richterite the maximum crystal growth is low (approximately 14 μms^{-1}) where no other crystalline phases are present. Fluor-tremolite can be produced at a much higher rate but pyroxene is also present in the microstructure. Fluor-magnesiorichterite can be produced with a water-swelling tetra-silicic mica as a second phase; although initially considered undesirable this may be useful as a means of fiberising the filaments. (14 refs.)

103043 Growth reactions of potassium titanate fibers by slow-cooling calcination method. Y.Fujiki (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.189-96 (1983). In Japanese.
The growth of potassium titanate fibers was studied by a new growth technique called 'slow-cooling calcination method'. By this method, a specific composition is incongruently melted into a solid phase and liquid phase, and then is slowly cooled to a temperature region below the incongruent-melting temperature. Fibrous crystals are grown by a incongruent melt-association reaction between the solid and liquid phases during the cooling process. In the system $K_2Ti_2O_5$-$K_2Ti_6O_{13}$, a stating material having the n value between $2<n<6$ in the $K4_2.n\mathrm{TiO}_2$ formula was incongruently melted into a liquid phase and $K_2Ti_6O_{13}$ solid phase at above the incongruent-melting temperature (1114°C±15°C) of $K_2Ti_4O_9$, and then was slowly cooled to a temperature region below 1114°C. During the slow-cooling process, the incongruently melted $K_2Ti_6O_{13}$ solid phases and liquid phase again reacted to associate. This association reaction plays a very important role in the growth of potassium titanate fibers, especially $K_2Ti_4O_9$ fibers. (17 refs.)

81.10H Zone melting and zone refining

103044 On control of the composition of solid solutions of $Ga_{1-x}In_xSb$ and $Ga_{1-x}Al_xAs$ in the process of temperature-gradient zone refining. R.Antanavicius, K.Valacka, P.Miskinis, G.Treideris (Inst. of Semiconductor Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.45-9 (1982). Translation of: *Litov. Fiz. Sb. (USSR),* vol.22, no.2, p.57-63 (1982).
The effect of temperature, zone composition, and depletion are analysed upon moving through the source on the composition of $Ga_{1-x}In_xSb$ and $Ga_{1-x}Al_xAs$ solid solutions as a function of the growth temperature is obtained for various initial zone compositions, as the profiles of the composition for various temperature and initial zone compositions. The theoretical findings are compared with available experimental data; good agreement is observed. Zone depletion for $Ga_{1-x}In_xSb$ appears only for large fractions of the InSb component or at low temperatures. (11 refs.)

81.10J Growth from solid phases

(inc. multiphase diffusion and recrystallisation)

103045 Synthesis of a new ramsdellite-like phase of approximate composition, $Li_2MgSn_3O_8$. C.Keller (Div. Estudios de Posgrado, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), A.R.West.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.451-2 (Aug. 1983).
The authors have prepared a new phase, of composition close or equal to $Li_2MgSn_3O_8$, which is ramsdellite-like. Its framework has the constitution $(Mg, Sn_3)O_8$ and Li^+ ions reside in the tunnels, although their precise location is not known. The new phase was encountered during a study of compound formation in the system Li_2O-MgO-SnO_2. It was prepared by a solid state reaction, using Li_2CO_3, $Mg(NO_3)_26H_2O$ and SnO_2 in the molar ratio 1:1:3 as starting materials, in platinum crucibles in an electric muffle furnace. (10 refs.)

103046 Low temperature synthesis of binary chalcogenides. N.Yellin, L.Ben-Dor (Soreq Nuclear Res. Centre, Yavne, Israel).
Mater. Res. Bull. (USA), vol.18, no.7, p.823-7 (July 1983).
Synthesis of tellurides and selenides of Hg, Cd, Zn, Ge, Sn and Pb at temperatures considerably below the melting point of the compounds, was studied. The reaction went to completion within a few days. (19 refs.)

103047 Explosive recrystallization of ion implantation amorphous silicon layers. J.Narayan (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), G.R.Rozgonyi, D.Bensahel, G.Auvert, V.T.Nguyen, A.K.Rai.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.177-84
Explosive recrystallization of amorphous layers, induced by scanned electron or CW Ar^+ laser beams, has been investigated in arsenic implanted (100) specimens. The authors have studied the microstructural changes using plan-view and cross-section electron microscopy to obtain the mechanism of explosive recrystallization phenomenon. The confinement of heat in the amorphous layers during laser irradiation and the nature of amorphous silicon determine the modes of explosive recrystallization. They indicate that, depending upon the degree of undercooling, two distinct modes of liquid-phase recrystallization are observed: one occurring at a velocity of $\sim 2\ ms^{-1}$ and the other at $\sim 10\ ms^{-1}$. Explosively recrystallized grains contain $\langle 110 \rangle$ and $\langle 1\bar{1}0 \rangle$ as surface normal and growth direction respectively. They present a model for unseeded crystallization to explain the $\langle 110 \rangle$ texture observed in diamond cubic lattices. (8 refs.)

81.15C Deposition by cathodic sputtering

103048 Method of selectively producing very thin oxide or nitride layers on silicon substrates. T.Bayer, C.Brandeis, H.Hinkel, J.Kempf (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.12, p.6637-8 (May 1983).
The production of very thin oxide or nitride layers by ion-implanting oxygen or nitrogen into silicon can be improved by additionally implanting noble gas ion, thus influencing the sputter rate and the stoichiometry of the generated layers. (no refs.)

103049 Conducting crystals. A latticework for microchips. S.Haines.
Sci. Dimension (Canada), vol.15, no.3, p.18-22 (1983).
Describes studies by the Canadian National Research Council's Chemical Physics section on thin film techniques for semiconductor deposition. The techniques of magnetron sputtering and metalorganic chemical vapor deposition (or MOCVD) are being studied in detail. The thin films are intended for applications in devices, such as solar cells. (no refs.)

103050 Silicon nitride and oxynitride films prepared by ion beam reactive sputtering. V.A.Burdovitsin (Inst. of Automatic Control Systems & Radioelectronics, Tomsk, USSR).
Thin Solid Films (Switzerland), vol.105, no.3, p.197-202 (22 July 1983).
The composition of particles sputtered from a silicon target during bombardment by nitrogen and oxygen ions was measured. Elementary processes on both the substrate and target were examined. A model of silicon nitride film formation was proposed, in which the main idea is the interaction of silicon on the substrate with the atomic nitrogen sputtered from the target. The dependence of the film properties on the oxygen concentration in N_2-O_2 mixtures was investigated. The relationship between the nitrogen and silicon concentrations in silicon nitride films, the nitrogen ion beam incidence angle and the ejection angle of the sputtered particles was revealed experimentally. In the proposed model this relationship is interpreted as a result of the difference between the angular distributions of silicon and nitrogen atoms sputtered from the target. (17 refs.)

103051 Mechanisms of reactive sputtering of titanium nitride and titanium carbide. I. Influence of process parameters on film composition. J.-E.Sundgren, B.-O.Johansson, S.-E.Karlsson (Dept. of Phys. & Measurement Technol., Linkoping Univ., Linkoping, Sweden).
Thin Solid Films (Switzerland), vol.105, no.4, p.353-66 (29 July 1983).
The reactive sputtering of titanium in mixed Ar-N_2 and Ar-CH_4 discharges was studied by measuring the compositions of both the deposited films and the layers formed on the target. The sputtering experiments were performed in a diode RF sputtering unit and the compositions were determined by means of Auger electron spectroscopy. The results show that the amount of reactive constituents incorporated into the growing films depends on whether a compound has been formed on the target. At low pressures where no such compound is formed, the incorporation of the reactive gas follows an adsorption isotherm similar to the Langmuir adsorption isotherm, and very low values of the sticking probability are observed. At higher pressures species originating from the target determine the composition of the coatings. The important process parameters were found to be the partial pressures of the reactive and inert working gases, the ion current density and the partial pressures of the reactive and inert working gases, the ion current density and the voltage applied to the target. (28 refs.)

103052 Mechanisms of reactive sputtering of titanium nitride and titanium carbide. II. Morphology and structure. J.-E.Sundgren, B.-O.Johansson, S.-E.Karlsson, H.T.G.Hentzell (Dept. of Phys. & Measurement Technol., Linkoping Univ., Linkoping, Sweden).
Thin Solid Films (Switzerland), vol.105, no.4, p.367-84 (29 July 1983).
For pt.I see ibid., vol.105, p.353-66 (1983). Titanium was reactively RF sputtered in mixed Ar-N_2 and Ar-CH_4 discharges onto substrates held at 775K. The films obtained were characterized by scanning electron microscopy and X-ray diffraction and through measurements of the microhardness and electrical resistivity. The composition of the films was determined by Auger electron spectroscopy. The measurements show that the morphology of the deposits to a large extent influences the properties of the films obtained. For TiN coatings the electrical resistivity reaches the bulk resistivity only if coatings with the full bulk density are obtained. The difference observed in the lattice parameter for TiN thin film and bulk samples is explained using a grain boundary relaxation model. It is also shown that the heat of formation of the compounds plays an important role in the formation of carbide and nitride films. A high heat of formation promotes the development of large grains and dense structures. (49 refs.)

103053 Mechanisms of reactive sputtering of titanium nitride and titanium carbide. III. Influence of substrate bias on composition and structure. J.-E.Sundgren, B.-O.Johansson, H.T.G.Hentzell, S.-E.Karlsson (Dept. of Phys. & Measurement Technol., Linkoping Univ., Linkoping, Sweden).
Thin Solid Films (Switzerland), vol.105, no.4, p.385-93 (29 July 1983).
For pt.II see ibid., vol.105, p.367-84 (1983). Films of Ti-N and Ti-C were grown by reactive RF sputtering of titanium in mixed Ar-N_2 and Ar-CH_4 discharges on negatively biased substrates. The compositions of the films were measured using Auger electron spectroscopy and their structure and morphology studied using X-ray diffraction and scanning electron microscopy respectively. The composition was found to be strongly affected by the bias voltage. An increase in bias increases both the carbon and the nitrogen contents in substoichiometric films. However, when stoichiometric TiN is formed no further change in the composition occurs. For Ti-C films an increase in the carbon-to-titanium ratio above 1.0 is possible. The structure is also affected by the bias voltage. For example the grain size of TiN has a maximum at a bias of -200 V. A possible explanation is a double influence of the ion bombardment. At low voltages, the adatom mobility is enhanced and the grain size increases but as the bias increases resputtering of species from the growing film surface becomes increasingly important and the grain size decreases. (32 refs.)

103054 An examination of the reactive sputtering of silicon nitride on to gallium arsenide. D.C.Bartle, D.C.Andrews, J.D.Grange, A.D.Trigg, D.K.Wickenden (GEC Res Lab., Hirst Res. Centre, Wembley, England).
Vacuum (GB), vol.33, no.7, p.407-10 (July 1983).
The deposition of silicon nitride thin films by the reactive sputtering of elemental silicon in a nitrogen/argon plasma has been investigated. The composition of the films has been examined using infra-red reflectance, X-ray photoelectron and Auger electron spectroscopies and spark source mass spectrometry. Oxygen has been found to be a major contaminant in these sputter deposited films, the oxygen concentration depending on the ambient gas pressure. The use of the silicon oxy-nitride films as annealing encapsulants for the activation of silicon ion implanted semi-insulating gallium arsenide has also been investigated. (12 refs.)

81.15G Vacuum deposition

103055 Growth of $Al_{0.3}Ga_{0.7}As$ by molecular beam epitaxy in the forbidden temperature range using As_2. L.P.Erickson, T.J.Mattord, P.W.Palmberg (Phys. Electronics Div., Perkin-Elmer, Eden Praire, MN, USA), R.Fischer, H.Morkoc.
Electron. Lett. (GB), vol.19, no.16, p.632-3 (4 Aug. 1983).
Using a thermal cracker and polycrystalline arsenic source material, dimeric arsenic is obtained and utilised to grow $Al_{0.3}Ga_{0.7}As$ layers in the temperature range of 600 to 700°C with excellent surface morphologies. It has been previously found that, with tetrameric arsenic, excellent surface morphologies are possible only below 630°C and above 690°C. Based on these observations, it is postulated that above 630°C tetrameric arsenic has a surface lifetime that is too short to provide enough coverage even when the beam flux is increased dramatically. At and above 700°C, tetrameric arsenic is cracked more effectively by the surface energy gained from the substrate leading to a good surface coverage and to good surface morphologies. (6 refs.)

103056 System grows complex single crystal materials.
Solid State Technol. (USA), vol.26, no.7, p.39-40 (July 1983).
Describes the Perkin-Elmer PHI Model 425B MBE system which employs molecular beam epitaxy to grow complex single crystal, multilayer thin film materials used in semiconductor applications. It can also be used to substrate preparation and characterization or to analyze completed films using a variety of surface analysis techniques. Auger electron spectroscopy, scanning Auger, ESCA or SIMS are among the techniques available. (no refs.)

103057 Molecular beam epitaxy and negative ions. M.Suffczynski (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Vacuum (GB), vol.33, no.7, p.369-72 (July 1983).
Sticking coefficients of neutral atoms to typical semiconductor surfaces measured in molecular beam epitaxy are compiled together with binding energies of the atom negative ions. Neutral atoms which have no electron affinity have small sticking coefficients. This correlation is analysed, and reasons to explain the exceptions from it are advanced by consideration of the atomic centrifugal potential. Extended measurements of sticking coefficients of neutral atoms, particularly from the second column of the periodic table, are suggested. (43 refs.)

103058 Description of a deposition cell employing evaporation under vacuum. L.Rabardel, A.Levasseur, C.Delmas, P.Hagenmuller (Lab. de Chimie du Solide, CNRS, Talence, France).
Vide les Couches Minces (France), vol.38, no.217, p.289-94 (May-July 1983). In French.
To improve the electrolyte-negative electrode contact in 'all solid state' batteries, a compact lithium evaporation apparatus has been conceived and built. Good quality and well localised lithium layers have been obtained without thermal damage of the electrolyte. (7 refs.)

81.15H Chemical vapour deposition

103059 CVD of niobium germanides from partially reacted input gases. C.F.Wan, K.E.Spear (Materials Sci. & Engng. Dept., Pennsylvania State Univ., University Park, PA, USA).
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.7, no.2, p.149-55 (April-June 1983).
Thermodynamic calculations using Eriksson's SOLGASMIX computer program were used to model changes in the chemical vapor deposition behavior of $NbCl_5$-$GeCl_4$-H_2 gaseous mixtures as the chemical reactions proceed from their initial stages toward their final equilibrium state. These illustrative modeling studies show the deposition behavior of this system is quite sensitive to changes in experimental variables and to partial reactions of the input gases. The deposition of single-phase Nb_3Ge at all stages of the progressive CVD reaction processes is favored by the use of higher temperatures and higher concentrations of hydrogen. (18 refs.)

103060 Growth process of silicon over SiO_2 by CVD: epitaxial lateral overgrowth technique. L.Jastrzebski, J.F.Corboy, J.T.McGinn, R.Pagliaro,Jr. (RCA Labs., Princeton, NJ, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1571-80 (July 1983).
The epitaxial lateral overgrowth (ELO) process of depositing single crystal silicon over a SiO_2 mask is described. A CVD technique has been developed which consists of depositing silicon in openings in a SiO_2 mask and then growing the silicon laterally over the SiO_2 film. By optimizing the HCl concentration in the gas, growth temperature, and the use of a growth procedure based on a series of growth/etch steps the nucleation of polysilicon over SiO_2 has been eliminated and monocrystalline ELO films have been grown. Low defect density ELO films have been achieved by orientating the oxide islands along the [010] direction on (100) substrates. The growth kinetics, overgrowth morphology, and defect formation in ELO films are described as a function of the growth conditions. One can conclude that optimization of the growth process has allowed the authors to grow monocrystalline, low defect density ELO films with smooth mirrorlike surfaces. (31 refs.)

103061 Density and deposition rate of chemically vapour-deposited Si_3N_4-TiN composites. T.Hirai, S.Hayashi (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Mater. Sci. (GB), vol.18, no.8, p.2401-6 (Aug. 1983).
Si_3N_4-TiN composites with an Si_3N_4 matrix and TiN dispersion were prepared at deposition temperatures of 1050 to 1450°C and total gas pressures of 1.33 to 10.7 kPa by the chemical vapour deposition of a $SiCl_4$-$TiCl_4$-NH_3-H_2 system. The density and deposition rate were measured and the formation mechanism of the composites was considered. The density of the crystalline (α or β) Si_3N_4 matrix was practically equal to the theoretical values. However, the density of the amorphous Si_3N_4 matrix was between 2.85 and 3.03 g cm^{-3}, depending on the deposition conditions. The highest growth rate of thickness for the composites was 0.47 mm h^{-1}. The deposition rate of the Si_3N_4 matrix increased with the addition of $TiCl_4$ vapour, the apparent activation energy being 68 to 84 kJ mol^{-1}. The deposition rate of the TiN dispersion exhibited a minimum at a deposition temperature of 1250 or 1350°C. (15 refs.)

103062 Apparatus for the epitaxial growth of semiconductor compounds by close-spaced vapour transport. J.M.Laroche, G.Cohen-Solal (Lab. de Phys. du Solide, CNRS-Bellevue, Meudon, France).
Rev. Phys. Appl. (France), vol.18, no.8, p.515-18 (Aug. 1983). In French.
The authors describe an apparatus which is used for the transport of a material upon a substrate, in a vessel where the pressure or the flow rate of the reactive gas are determined; the mean characteristics are the control and the stability of the temperature, the fast settlement of the thermal program and the possibility of in situ operations. Measurement accuracy and use flexibility make this apparatus well adapted to experimental research. The epitaxial growth of a semiconductor compound (CdTe) is given as an example of application. (22 refs.)

103063 Production of microstructures by laser pyrolysis. D.Bauerle (Angewandte Phys., Univ. of Linz, Linz, Austria).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.19-28
Laser pyrolysis at short wavelengths is a powerful tool for micron-sized one-step local deposition of insulating, semiconducting and metallic materials from the gas phase. Various structures, e.g. stripes on different substrates, and rods of various lengths and diameters, have been produced. The morphology of the deposited material, the deposition rate, and the dimensions (typically 1-300 μm) of the structures were investigated quantitatively as functions of laser irradiance, local temperature, laser focus diameter, scanning velocity, and gas pressure. (20 refs.)

103064 Laser photolytic deposition of thin films. P.K.Boyer, C.A.Moore, R.Solanki, W.K.Ritchie, G.A.Roche, G.J.Collins (Dept. of Electrical Engng., Colorado State Univ., Fort Collins, CO, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.119-27
An excimer laser is used to photochemically deposit thin films of silicon dioxide, silicon nitride, aluminium oxide, and zinc oxide at low temperatures (100-350°C). Deposition rates in excess of 3000 Å/min and conformal coverage over vertical walled steps were demonstrated. The films exhibit low defect density and high breakdown voltage and have been characterized using IR spectrophotometry, AES, and C-V analysis. Device compatibility has been studied by using photodeposited films as interlayer dielectrics, diffusion masks, and passivation layers in production CMOS devices. Additionally, the authors have deposited metallic films of Al, Mo, W, and Cr over large (>5 cm^2) areas using UV photodissociation of trimethylaluminium and the refractory metal hexacarbonyls. Both shiny metallic films as well as black particulate films were obtained depending on the deposition geometry. The black films are shown to grow in columnar grains. The depositions were made at room temperature over pyrex and quartz plates as well as silicon wafers. The authors have examined the resistivity, adhesion, stress and step coverage of these films. The films exhibited resistivities at most $\sim$20 times that of the bulk materials and tensile stress no higher than 7×10^9 dynes/cm^2. (8 refs.)

103065 UC laser-initiated formation of Si_3N_4. T.F.Deutsch, D.J.Silversmith, R.W.Mountain (Lincoln Lab., MIT, Lexington, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.129-34
Si_3N_4 films have been deposited on Si by using 193 nm ArF excimer laser radiation to initiate the reaction of SiH_4 and NH_3 at substrate temperatures between 200-600°C. Stoichiometric films having physical and optical properties comparable to those produced using low-pressure chemical vapor deposition (LPCVD) have been produced. The dielectric properties of the films are at present inferior to those of LPCVD material. (11 refs.)

103066 The spectroscopy and photolysis of metallo-organic precursors to III-V compounds. M.R.Aylett, J.Haigh (British Telecom Res. Labs., Ipswich, England).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.177-82
The authors describe the deposition by light-stimulated breakdown of gallium and indium on borosilicate glass, gallium arsenide and indium phosphide substrates, from precursors whose ultraviolet (UV) spectra have recently been reported. Some preliminary work on the deposition of indium phosphide is also reported, using an indium-phosphorus complex whose UV spectrum is also given. (13 refs.)

103067 Semiconductor thin films grown by laser photolysis. J.G.Eden, J.E.Greene, J.F.Osmundsen, D.Lubben, C.C.Abele, S.Gorbatkin, H.D.Desai (Univ. of Illinois, Urbana, IL, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.185-92
Thin ($\leq$1.2 μm) Ge and Si films have been grown with rates up to 3.6 μm/hr by laser-induced chemical vapor deposition (LCVD) on a variety of substrates. Germanium films grown on amorphous SiO_2 (quartz) by photodissociating GeH_4 in He at 248 nm (KrF laser) exhibit grain sizes of 0.3-0.5 μm that increase only slightly up to the pyrolytic threshold for GeH_4 (280°C). On (100) NaCl, however, Ge films grown at a substrate temperature of 120°C are epitaxial. The activation energy for the LCVD growth of Ge films (from GeH_4) on SiO_2 is measured to be 85 ± 20 meV which suggests that germanium is arriving at the substrate in atomic form. The wavelength and intensity dependence of the initial film growth rate supports the conclusion that this process is photolytic and is initiated by the absorption of a single photon. (7 refs.)

103068 Laser stimulated growth of epitaxial GaAs. W.Roth, H.Krautle, A.Krings, H.Beneking (Inst. of Semiconductor Electronics, Aachen, Germany).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.193-8
Stimulated growth of single crystalline GaAs has been obtained by irradiation of (100) oriented GaAs substrates inside an MOCVD reactor with a pulsed Nd-YAG laser. Process temperatures have been varied between 540°C and 360°C. In the non-irradiated areas, below 480°C substrate temperature the growth rate decreases rapidly, whereas in the irradiated part of the substrate epitaxial layers could be grown in the whole temperature range investigated. Below 450°C, the growth is reaction limited. (6 refs.)

103069 Laser induced chemical vapor deposition of hydrogenated amorphous silicon. R.Bilenchi, I.Gianinoni, M.Musci (CISE SpA, Milano, Italy), R.Murri.
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.199-205
Some results on hydrogenated amorphous silicon growth by CO_2 laser photodissociation of silane are reported. A 100 W CW CO_2 laser was used as the excitation source. The photoproduced radicals by interacting with the surface grow a film at a rate strongly depending on silane pressure, substrate temperature and laser intensity. This experimental configuration allows depositions on large areas, owing to the large number of reactant molecules involved in the photochemical process. Moreover, material can be produced with a continuously variable hydrogen content, since the substrate temperature required for obtaining depositions can be as low as room temperature and adjusted independently of the other process parameters. The film properties are similar to those of the glow discharge deposited material. The film amorphousness and the hydrogen presence either in monohydride and dihydride groups are evidenced by X-ray patterns and IR spectra. Results on the electrical and optical properties are also reported. (9 refs.)

103070 Direct writing using laser chemical vapor deposition. S.D.Allen, A.B.Trigubo, R.Y.Jan (Center for Laser Studies, Univ. of Southern California, Los Angeles, CA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.207-14
Metal, dielectric and semiconductor films have been deposited by laser chemical vapor deposition (LCVD) using both pulsed and CW laser sources on a variety of substrates. For LCVD on substrates such as quartz, the deposition was monitored optically in both transmission and reflection using a collinear visible laser and the depositing CO_2 laser. Deposition initiation and rate were correlated with irradiation conditions, the laser generated surface temperature, and the changing optical properties of the film substrate during deposition. Single crystallites of W greater than 100 μm tall were deposited using a Kr laser on Si substrates. (14 refs.)

81.15J Ion plating and other vapour deposition

103071 Growth of 1.3-μm double heterostructure GaInAsP/InP by liquid phase epitaxy. Wu Xiang-sheng, Yang Yi, Li Yun-ping, Tang Qiang-mei, Shui Hai-long (Shanghai Inst. of Metall., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.489-92 (April-June 1983).
1.3-μm GaInAsP/InP DH wafers were prepared using the conventional two-phase solution LPE technique in the YW-1 type furnace and graphite-slider boat, under a Pd purified H_2 atmosphere, in the temperature range of 670-610°C. Before the epitaxial growth, the (100) facet of the InP substrate was etched with a pure In melt or unsaturated InP-In melt in order to remove the defect layers, then the *n*-type InP layer (Sn or Te doped), GaInAsP layer (undoped), *P*-type InP layer (Zn or Mg doped) were grown in successive order, or another *p*-type GaInAsP layer (Zn or Mg doped) was grown. After the LPE growth, the cleaved facet was stained with KOH and $K_3Fe(CN)_6$ aqueous solution and the layer thicknesses were measured by means of a scanning electron microscope. (7 refs.)

103072 The drawing of thin films of $Bi_{12}GeO_{20}$ by method of impulsive plasma evaporation. B.B.Davydov, F.Sh.Islamov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.85-7 (1982). In Russian.
This work deals with the drawing of thin films of $Bi_{12}GeO_{20}$ by the method of impulsive plasma evaporation. Electronographic investigations of thin films have been conducted, which show that the film structure coincides with that of the initial crystal $Bi_{12}GeO_{20}$. (8 refs.)

103073 RF-plasma deposited amorphous hydrogenated hard carbon thin films: preparation, properties, and applications. A.Bubenzer, B.Dischler, G.Brandt, P.Koidl (Fraunhofer-Inst. fur Angewandte Festkorperphys., Freiburg, Germany).
J. Appl. Phys. (USA), vol.54, no.8, p.4590-5 (Aug. 1983).
The deposition of amorphous hydrogenated hard carbon (*a*-C:H) thin films from benzene vapor in a RF plasma is described. a-C:H was deposited on glass, quartz, Si, Ge, and GaAs. Negative self-bias V_B and gas pressure P are shown to be the two significant parameters for an accurate control of the deposition process. The dependence of growth rate and deposition temperature on V_B and P was determined; this gives an empirical relation for the average energy $\bar{E}$ of the ions forming the thin films. Refractive index (1.85-2.20 in the IR), optical gap (0.8-=1.8 eV) and density (1.5-1.8 g/cm^3) of *a*-C:H was measured. The optical gap varies linearly with the content of bonded hydrogen in the films. The density of *a*-C:H is proportional to the average ion energy $\bar{E}$. The authors demonstrate the application of *a*-C:H as antireflective coating on Ge for 10.6 μm (reflection $<$0.2% at 10.6 μm) and as terminating layer of an optical multilayer stack. (27 refs.)

103074 Synthesis in a low power microwave discharge. II. Amorphous silicon nitride and polycrystalline silicon. P.M.Jeffers, S.H.Bauer (Dept. of Chem., Cornell Univ., Ithaca, NY, USA).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.189-93 (Aug. 1983).
For pt.I see Inorg. Chem., vol.20, p.4632 (1981). The authors previously reported on the partial reduction of trimethyoxyborane by hydrogen when mixtures of these gases were passed through a low power microwave (S band) discharge. Here they describe experiments with mixtures of $SiCl_4/H_2$, SiF_4/H_2 and $SiCl_4/N_2/H_2$. Indeed, microwave discharge conditions proved to be particularly effective for producing elementary polycrystalline silicon from the tetrahalides, and amorphous Si_3N_4 from the mixtures which incorporated N_2. The mechanisms have yet to be determined. (5 refs.)

103075 Curved sheet plasma for ion plating. J.Uramoto (Inst. of Plasma, Nagoya Univ., Nagoya, Japan).
J. Vac. Soc. Jpn. (Japan), vol.26, no.6, p.551-5 (1983). In Japanese.
A simple method for producing curved sheet plasma (with large width and thin thickness) is described, in which two different shapes of permanent magnets are arranged on both sides of a cylindrical plasma column along a magnetic field. Using the curved sheet plasmas for ion plating of curved large surfaces, one can collect an ion current of high density in a very high power and gas efficiency. (2 refs.)

103076 Auger electron spectroscopy interface study of evaporated and ion-plated silver films on steel substrates. L.M.Wang, F.Z.Wang, J.H.Zhang, L.h.Zhai (Dept. of Metallic Materials Sci. & Engng., Beijing Polytech. Univ., Beijing, China), P.G.Cao.
Thin Solid Films (Switzerland), vol.105, no.4, p.319-23 (29 July 1983).
Thin silver films were deposited onto steel substrates by either evaporation or ion plating, which included not only the conventional ion plating process with a high substrate bias (-3 kV) and a resistance-heated evaporation source but also a process with low bias (-50 V) and a hollow cathode electron beam source which could provide a higher ionizing rate. The width of the interfaces and the oxygen distribution were analysed by Auger electron spectroscopy combined with the ion etching technique. Also the adhesion of the films was examined by means of a scratch test and a thermal shock test. It was found that for silver on steel, an insoluble pair of materials, only ion plating with a high substrate bias could produce a 'pseudodiffusion'-graded interface, and the excellent adhesion of the film to the substrate should be attributed to the cleaned and graded interface. (13 refs.)

103077 Thin films prepared by plasma polymerization of methylmethacrylate and their properties as an electron beam resist. L.Martinu, H.Biederman (Faculty of Math. & Phys., Charles Univ., Prague, Czechoslovakia).
Vacuum (GB), vol.33, no.5, p.253-4 (May 1983).
Plasma polymerized methyl-methacrylate (PPMMA) thin films were formed under various conditions in an AC glow discharge using a bell-jar type reactor with parallel plate electrodes. It has been found that the deposition rate increases in the frequency range from 10 to 50 kHz. The possibility of using the films as an electron beam resist has been investigated. (11 refs.)

103078 Ion energy distribution in ion plating. J.Machet, P.Saulnier, J.Ezquerra, J.Guille (Lab. de Phys. Ionique, Univ. de Limoges, Limoges, France).
Vacuum (GB), vol.33, no.5, p.279-84 (May 1983).
A very simple experimental set-up allows determination of the energy distribution of ions striking the substrates during deposition by ion plating. The ion energy is measured by the retarding field method. The results obtained for a discharge in argon agree with those predicted by the theoretical model of charge transfer. For discharges, generated during the deposition process, the energy distribution of the ions of the gas bearing the discharge and those of the deposited material, agree again with this model. The average energy of the metallic ions is higher than that of the ions of the gas bearing the discharge. For flat cathodes the distribution is the same for all the points except near the shield around the cathode up to a spacing of the order of the cathode dark space length. If the cathode is not flat this distribution is greatly modified. (12 refs.)

81.15L Deposition from liquid phases (melts and solutions)

103079 Electrodeposition of Ni-B_4C dispersion coatings. N.Furukawa, T.Hayashi (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.133-41 (1982).
The electrodeposition of Ni-B_4C dispersion coatings from a Watts nickel bath (1.2 M Ni) is studied to determine the factors affecting the codeposition of B_4C particles in the coatings. The influence of the concentration of dispersoids, current density, pH, and agitation on the codeposition of B_4C particles with nickel was examined at 45°C. The codeposition rate of the B_4C particles with nickel was found to increase with increasing current density. The Ni-B_4C coatings tend to become rougher than Ni-Al_2O_3 deposits. Addition of organic leveling and brightening agents to the plating bath, however, gave rise to the smooth deposits with a high value of hardness (Hv 690). (12 refs.)

103080 Electrodeposition of niobium-germanium alloys from molten fluorides. U.Cohen (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1480-5 (July 1983).
Niobium-germanium alloys were obtained by electrodeposition from molten fluoride solutions containing 5 mol percent of K_2NbF_7, and various concentrations of K_2GeF_6 in the KF-LiF eutectic solvent. The molten bath temperature was typically about 750°C. Cathodes (or substrates) were made of Mo and W foils, and a Ge sheet was used as a dissolving anode. Stable growth deposits were obtained of the intermetallic compounds $NbGe_2$, Nb_3Ge_2, Nb_5Ge_3, and their phase-mixtures by varying the germanium ion concentration in the molten bath. Germanium was found to be more noble than niobium in the molten fluoride bath, thus facilitating the deposition of germanium rich alloys. The superconducting compound, Nb_3Ge, however, could not be obtained as a single-phase deposit. It was obtained only as a minor constituent in certain phase-mixtures when operating under extreme conditions. (25 refs.)

103081 Measurement of electroless plating rate by coulostatic method. N.Sato, M.Suzuki, Y.Sato (Res. & Dev. Center, Toshiba Corp., Kawasaki, Kanagawa, Japan).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1485-8 (July 1983).
The copper deposition rate in a production electroless copper plating bath was measured by the coulostatic method. The effects of the substrate material and the degree of bath aging on the measured parameters were investigated. The deposition current density i_{ELP}, obtained from weight gain data of the specimen, the double layer capacity C_d, and the polarization resistance R_p measured by this method depended on the substrate material, while the proportionality constant K for conversion from R_p to i_{ELP} was almost constant. The dependence of i_{ELP}, C_d, and R_p on the substrate material was interpreted in terms of the surface roughness of the substrate. The possibility of using this method for real time monitoring of electroless deposition rates was demonstrated by these results. (15 refs.)

103082 Importance of hydrogen evolution in the development of structural imperfections during nickel electrocrystallisation. V.M.Kozlov (Togliatti Polytech. Inst., USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1203-7 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1353-8 (Oct. 1982).
Electron microscopy and X-ray analysis were used to study the structure of electrolytic nickel deposits obtained from a sulfate bath as a function of cathodic current density, electrolyte pH, and the anodic component of current density when using periodic current. It is suggested that the development of twinning defects and dislocation boundaries is due to incoherent nucleation. The importance of adsorbed hydrogen in the development of structural imperfections during nickel electrocrystallization is discussed in terms of atomistic nucleation theory. (15 refs.)

103083 Investigation of the mechanism of the inhibiting action of cinnamaldehyde in the electrodeposition of a tin-bismuth alloy. A.N.Popov, K.M.Tyutina (D.I. Mendeleev Moscow Chem. Technol. Inst., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1250-3 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1403-7 (Oct. 1982).
In a consideration of the question of the mechanism of the action of luster-forming compositions used in the electrodeposition of coatings of alloys of tin and containing the traditional 'condensation product', nonioniogenic surfactant, and formaldehyde, the elucidation of the causes of the strong inhibiting action of the original components of such compositions is of substantial interest. The present work is devoted to an investigation of the influence of the luster-forming additive N-3, containing cinnamaldehyde as the main inhibiting component, on the cathode process of electrodeposition of a tin-bismuth alloy. (12 refs.)

103084 Electrochemically prepared polythienylene films. S.Hotta, T.Hosaka, W.Shimotsuma (Central Res. Labs., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Synth. Met. (Switzerland), vol.6, no.1, p.69-71 (June 1983).
Polythienylene films of 5-10 μm in thickness were prepared on an indium-tin oxide surface by applying a current of 2 mA cm^{-2} for 20 min in a two-electrode cell containing 0.24 M thiophene and an electrolyte in a solvent. The reaction system was held at room temperature of 5°C during the preparation of the films. Each green-black film was washed well with methanol and dried under vacuum at room temperature. X-ray diffraction patterns of the films show them to be amorphous. The densities of the films were measured by the flotation method in tetrachloromethane-xylene mixture. (2 refs.)

81.20 OTHER METHODS OF PREPARATION OF MATERIALS

103085 An analysis of the ribbon formation process by the single roller rapid solidification technique. K.Takeshita, P.Hideo Shingu (Dept. of Mech. Engng, Fukui Univ., Fukui, Japan).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.529-36 (July 1983).
The theory of flow boundary layer formation has been applied to the analysis of the process of ribbon formation by the single roller rapid solidification technique. It has hence become possible to solve simultaneously equations describing the fluid flow and heat flow, which take the viscosity change due to temperature reduction into consideration. The results of calculation by the use of finite difference method revealed quantitatively the relative importance of various process variables during the ribbon formation. Some of these results are contrary to those believed until the present from intuitive guesses. (14 refs.)

103086 Settling in solid-liquid systems with specific application to liquid phase sintering. A.N.Niemi, T.H.Courtney (Dept. of Metall. Engng., Michigan Technol. Univ., Houghton, MI, USA).
Acta Metall. (USA), vol.31, no.9, p.1393-401 (Sept. 1983).
The evolution of microstructure in liquid phase sintered (LPS) alloys as it occurs in a gravity environment is discussed. If the solid phase volume fraction (V_p) is initially sufficiently low, a dispersion of isolated solid particles within the liquid develops first. These isolated particles settle at a velocity approximately equal to the Stokes' velocity and, in a finite container, the settling leads to the formation of a solid skeleton when V_p reaches a critical value. One formed, a skeletal structure can continue to settle. The settling mechanism is controlled by 'extrication' of solid particles from the skeleton and their subsequent directional flow within the liquid as a result of the differing solid and liquid densities. (13 refs.)

103087 Powder metallurgy of amorphous metallic systems. G.M.Gryaznov, V.N.Lapovok, I.G.Naumenko, V.I.Serbin, L.I.Trusov.
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.973-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.619-23 (Nov. 1982).
The growing interest in amorphous metallic materials stems from their valuable combination properties. However, in the high-yield methods which have been developed for obtaining amorphous metals, the material is fabricated in the form of a ribbon not more than 15-20 μ thick. The problem of forming uniform bulk objects from such a ribbon has not been solved. The application of powder metallurgy could become an alternative solution in this case. This would require a technology for preparing powders of amorphous metallic alloys of various compositions; it would be desirable to control the process with the aim of preparing powders of the required grade. After certification of the powders, a technology for forming bulk objects from the powders by

pressure processing will be required. Finally, after cold or hot pressing and, possibly, sintering, a study should be made of the physical properties of the resulting bulk amorphous materials. The authors show the feasibility of such a powder technology for amorphous metallic systems. (4 refs.)

81.20G Specific metals and alloys (compacts, pseudoalloys)

103088 Hot isostatic pressing of niobium C-103 alloy shapes. M.Kibrick, E.H.Rennhack (Lockheed Missiles & Space Co., Sunnyvale, CA, USA), J.C.Runkle.
Int. J. Refract. & Hard Met. (GB), vol.2, no.2, p.71-7 (June 1983).
A study was undertaken to evaluate the properties of hot isostatically pressed (HIP) C-103 niobium alloy powder compacts. The purpose was to produce high quality near-net shapes for use in high temperature systems. Various HIP conditions, canning materials, and post-compaction vacuum annealing treatments used to achieve densities greater than 99% of theoretical are detailed along with the problems encountered; particularly detrimental reactions between the compacted powders and the canning material. Methods which minimize these reactions and facilitate can removal are discussed. Room temperature tensile and ductility data compared favourably with wrought material. Creep test data, obtained in vacuum at 3000F for the as-HIP and HIP plus vacuum annealed material and the results of optical and electron microscopy examinations are presented and discussed. (7 refs.)

103089 Morphology of zinc powder which has been atomised with a rotating electrode. M.Fiset, B.Champagne, R.Angers (Dept. de Mines et Metall., Univ. Laval, Ste-Foy, Quebec, Canada).
Scr. Metall. (USA), vol.17, no.7, p.817-22 (July 1983). In French.
An electric arc was struck between a tungsten electrode and a rotating zinc electrode to produce zinc powder in a chamber which could be evacuated and filled with either argon or helium. 99.999% zinc was used. The facets found on the zinc particles depended on the cooling rate of the zinc droplets formed in the electric arc and on the residual oxygen when the chamber had been evacuated to 6.65, 26.6 and 53.2 Pa. The residence time of the liquid droplets affected the formation of facets, because the nucleation process appeared to take place at the free surface of the droplets. (5 refs.) *R.S.*

81.20J Dispersion-,fibre-, and platelet-reinforced metal-based composites

103090 Dispersion hardening—a low cost technique for improving the hot strength of copper alloys. L.Berglin, O.Sjoden (Swedish Inst. for Metals Res., Stockholm, Sweden).
Scand. J. Metall. (Finland), vol.12, no.4, p.184-8 (1983).
A possible way is considered of making low cost dispersion strengthened copper alloys by a powder metallurgical manufacturing process, consisting of mechanical mixing, cold isostatic pressing and hot extrusion. The properties of the extruded alloys were found to be good, in particular the recrystallization temperatures were high for one alloy reaching approximately 800°C. (15 refs.)

81.20L Ceramics and refractories

103091 The beginning of the sintering of a ceramic: existing theories tried on dilatometric analyses. J.M.Haussonne.
Ind. Ceram. (France), no.772, p.328-33 (1983). In French.
Experiments were made on $BaTiO_3$ under a stretching force of 10 grammes and rates of temperature rise from 10 to 1100°C/h, in the temperature range from 750 to 1300°C. The results indicated that different mechanisms were involved, depending on whether the temperature rise was less or more than 150°C/h. It is thought that $BaTiO_3$ cannot be considered as a simple body. The different diffusion rates of Ti^{4+}, Ba^{2+}, and O^- are thought to make an analytical approach very difficult. The formation of crystallisation nuclei at intergranular contact points after shrinkage, crystal growth, diffusion through the growing crystals and crystalline growth at their surfaces are important starting phenomena for sintering. (8 refs.) *R.S.*

103092 The stability of SiC-based ceramics containing ZrO_2 and other oxides. J.Lorenz, H.L.Lukas (Inst. fur Werkstoffwissenschaften, Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany), E.E.Hucke, L.J.Gauckler.
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.7, no.2, p.125-35 (April-June 1983).
Calculations of thermochemical equilibria, using the program SOLGASMIX, have defined the conditions and compositions of SiC-based ceramics in which stable ZrO_2 particles can be obtained. The results are compared with experiments. The calculation method offers the possibility of evaluating compositions and fabrication conditions for $SiC\text{-}ZrO_2$ and $SiC\text{-}ZrO_2\text{-}Al_2O_3\text{-}SiO_2$ composites. (12 refs.)

103093 The production of fine silicon carbide powder by the reaction of gaseous silicon monoxide with particulate carbon. P.Kennedy, B.North.
Proc. Br. Ceram. Soc. (GB), no.33, p.1-15 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
Work on the carbothermic reduction of SiO_2 to produce SiC powder has indicated that the rate-controlling step is the generation of SiO vapour. With this in mind, a technique for producing fine beta SiC powder has been developed in which SiO vapour, generated from a separate ($Si\text{-}SiO_2$) source, is passed through a bed of particulate carbon and converts it to SiC powder. The dependence of the reaction on temperature and time has been investigated and the results suggest first order kinetics with an activation energy of about 466 kJ $mole^{-1}$. The technique has fundamental advantages over the carbothermic reduction of SiO_2 in terms of upscaling potential, product purity and raw material requirements. (11 refs.)

103094 Powder preparation for rapid sintering by the combined suspension-solution freeze drying technique. V.V.Pankov, M.Paulus, A.Dubon.
Proc. Br. Ceram. Soc. (GB), no.33, p.17-32 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
The freeze-drying of liquid solutions allows the preparation of very fine and chemically very homogeneous powders and therefore a low sintering temperature. The use of this technique may be restricted by different factors, among them the most important is the nonsolubility of one of the cations. The authors show, by a comparative analysis of the sintering of spinel, $MgAl_2O_4$ from powders obtained by various techniques, that you get a similar high sintering rate if you replace the freeze-drying of a pure liquid solution by that of a suspension of one oxide or salt in the liquid solution of the other cations. (5 refs.)

103095 The effect of compaction pressure on the coarsening of open pores in fired compacts made with agglomerated powder. G.Isik, P.F.Messer.
Proc. Br. Ceram. Soc. (GB), no.33, p.39-50 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
Compacts were formed over a wide range of pressure from a moist agglomerated powder mixture of clay, quartz and feldspar. They were dried and then fired at two temperatures for a number of soaking times. Their bulk densities, apparent porosities and shrinkages were determined and, most importantly, the open porosities were investigated using mercury porosimetry. It was found that increasing the compaction pressure reduced the apparent porosity and shrinkage and increased the bulk density. These effects are straightforward and expected. It was also found that the open porosity coarsened as the compacts shrank and that the coarsening was reduced by raising the compaction pressure. It is considered that this reduction occurred because of improved uniformity of porosity on a scale of size comparable to the size of the smaller of the agglomerates. (5 refs.)

103096 The preparation and properties of polycrystalline aluminium oxide fibres. J.D.Birchall.
Proc. Br. Ceram. Soc. (GB), no.33, p.51-62 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
Ceramic fibres are of growing interest and importance for a variety of applications such as high temperature insulation, hot gas filtration, the reinforcement of metals etc. A discussion is presented on polycrystalline fibres of Al_2O_3 and in particular, with fibres produced by the spinning of basic aluminium salt solutions and heat treatment of the resulting gel fibres. The nature of the precursor solutions is discussed as are the phase transformations that occur in the heat treatment sequence. The physical properties of the fibre are very dependent on process history. The relationship between properties and applications is discussed. (10 refs.)

103097 Influence of powder and green compact characteristics on microstructure of sintered alpha-SiC. E.Carlstrom, A.-K.Tjernlund, L.Hermansson, R.Carlsson.
Proc. Br. Ceram. Soc. (GB), no.33, p.89-100 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
A homogeneous green body is of importance for reaching high densities in the sintering of alpha-SiC. Inhomogeneities in the green body, such as large pores and agglomerates with a different density from the matrix, affect the ability to reach high final densities. Dense agglomerates tend to shrink away from the matrix, thereby causing cracks and pores. Alternative routes of powder preparation, such as spray drying, eliminate inhomogeneities and result in an improved microstructure. (10 refs.)

103098 Sintering of spray pyrolyzed Mg-Al spinel powder. S.Kanzaki (Government Industrial Res. Inst., Nagoya, Japan), T.Nishida, N.Otsuka, K.Saito, Z.Nakagawa, K.Hamano.
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.165-70 (1983). In Japanese.
The equimolar spinel powders have been synthesized by spray-pyrolysis of the water-methanol solutions of magnesium and aluminum nitrates, and their sinterability was studied. The specific surface area and pore volume of the powder dependend on the calcination temperature and showed maximum values when calcined at 400°C. Although the primary particle size and the specific surface area of the powder calcined at 400°C were 150 Å and 120 m^2/g, respectively, the lattice parameter of the powder was 8.081 Å, suggesting that the particles are composed of the nearly perfect spinel lattice. The as-sprayed powder showed poor sinterability, but the grinding increased the sinterability to a great extent. As the methanol content in the solvent was increased, the agglomerated particles became fragile and tended to fracture more easily by compression. Consequently, the bulk density of the sintered body increased with decreasing of the ratio of water/methanol ratio in the solvent. (8 refs.)

103099 Alumina-zirconia fine powders prepared by hydrothermal oxidation. M.Yoshimura, S.Kikugawa, S.Somiya (Dept. of Materials Sci., Tokyo, Inst. of Technol., Yokohama-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.183-8 (1983). In Japanese.
Fine powders of alumina-zirconia mixtures were prepared by hydrothermal oxidation of Al-Zr alloys which were fused in an arc image furnace. The hydrothermal oxidation of Al-Zr alloys proceeded above 500°C under 100 MPa for 3 h, and the obtained powders consisted of monoclinic zirconia, tetragonal zirconia and alpha-alumina. The average crystallite sizes of these phases were 13~24 nm, 9~12 nm, 27~35 nm, respectively, smaller than that of monoclinic zirconia or alpha-alumina (which was) prepared by hydrothermal oxidation of Zr or Al metal under the same condition. Alumina-zirconia powders prepared by this method were homogeneous mixtures of alumina and zirconia particles of which sizes were around 30 nm as determined by transmission electron micrograph (TEM) observation. (12 refs.)

103100 Densification and grain growth in hydrothermal reaction sintering of hafnia (HfO_2). H.Toraya, M.Yoshimura, S.Somiya (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.235-40 (1983). In Japanese.
Hydrothermal reaction sintering of hafnia (HfO_2) was studied under 100 MPa at temperatures up to 1300°C. HfO_2 formed from Hf and H_2O on heating was sintered above 900°C for 3 h. The density and crystallite size of sintered bodies increased monotonically with temperature in the range between 900°C and 1200°C, then saturated at the maximum relative density of 98%. The hydrothermal reaction sintering of HfO_2 proceeded through three stages with the following features: (1) a large increase in crystallite size was observed, while the density did not increase appreciably; (2) a large increase in density was observed, while crystallite size increased a little; (3) a small increase in density and a small variation of crystallite size were observed. The growth of crystallite size was influenced by the presence of high-temperature high-pressure water and the temperature of heat-treatment. The densification was thought to take place on the second and third stages in the hydrothermal reaction sintering mainly by pore elimination due to the effect of hot isostatic processing. Greyish sintered bodies were sometimes obtained, having a smaller crystalline size and larger density than white sintered bodies fabricated under the same experimental conditions. (16 refs.)

81.20N Cermets, ceramic and refractory composites

103101 A new composite ceramic material containing alumina: aluminalon. D.Turpin-Launay, P.Goeuriot, F.Thevenot.
Ind. Ceram. (France), no.772, p.343-5 (1983). In French.
In an attempt to slow down crack propagation in ceramics, a material with a propensity for microcracks was dispersed in the matrix of alumina. Hexagonal boron nitride was found suitable to improve the resistance to thermal shock of alumina. At 1400°C the composite material, which is called aluminalon (α-Al_2O_3-$ON\gamma$) was found to have as good or even better toughness than at ambient temperature. Hitherto, the new material has been made by heating and compression. A more economical way of manufacture would be by sintering, if this also gives acceptable mechanical characteristics. (5 refs.) *R.S.*

103102 Effect of wet milling and cobalt powders on the phase transformation and morphology of the cobalt. E.R.Kimmel (Chem. & Metallurgical Div., GTE Products Corp., Towanda, PA, USA).
Int. J. Refract. & Hard Met. (GB), vol.2, no.2, p.84-7 (June 1983).
Studies were made to assess the effect of wet milling of WC and Co on the cobalt cubic-hexagonal transformation; the morphology of the cobalt in the milled powder; and the subsequent physical properties and microstructure of the sintered product. The cobalt phase transformation was measured via quantitative X-ray diffraction. The cobalt morphology was examined using SEM and optical metallographic techniques on silver infiltrations of the milled powder. Results indicate: (1) The extent of cubic-hexagonal transformation depends on both milling intensity and initial carbide particle size; (2) cobalt is distributed as 2-6 μm agglomerates or flakes; and (3) physical properties and microstructure of resultant sintered bars show differences attributable only to additional WC attrition from increased milling intensity. (7 refs.)

81.20P Glasses

103103 Ce-Ta-(Al)-oxide porous glass ceramic. J.F.Bednarik, M.A.Res, R.W.White (Nat. Phys. Res. Lab., CSIR, Pretoria, S Africa).
Glass Technol. (GB), vol.24, no.3, p.122-6 (June 1983).
Substitution of the end-member oxides in the Na_2O-B_2O_3-SiO_2 ternary system was studied. Replacement of SiO_2 with a combination of CeO_2 and Ta_2O_5 ($CeO_2/Ta_2O_5=1.25$) produced glasses and ceramics which, after heat treatment, decomposed to form a leachable sodium borate phase and an insoluble glass ceramic phase. The mode of phase decomposition is sensitive to impurities to such an extent that selection of the melting crucible, e.g. sintered alumina or platinum-rhodium, leads to differences in pore size or surface area. These new materials have a specific surface area of 9-283 m^2/g and a pore radius of between 0.82 and 41.5 nm. (17 refs.)

103104 Zirconium as a raw material for special glasses. P.G.Devillebichot (Magnesium Elektron Ltd., Manchester, England).
Glass Technol. (GB), vol.24, no.3, p.139-42 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Recently developed glasses based on ZrF_4 have shown potential for fibre optics applications, amongst others, where a broadening of the infrared region of transparency is desired. Due to their adverse effect on optical properties, the levels of iron oxide and other transition and lanthanide metal oxides inherent in the raw material must be kept as low as possible. There are two main routes for producing ZrF_4 for use in special glasses, one involves the reaction of zirconium oxide with ammonium bifluoride and thermal decomposition of the resulting ammonium fluorozirconate and the other starts directly from the ammonium fluorozirconate: the former has been found to be the most popular. Magnesium Elektron produces a range of pure, chemically precipitated oxides of controlled particle shape and size, and has developed its G grade of oxides specifically for the glass and synthetic gemstone markets. Through co-operation between universities, research establishments, and the raw materials supplier, the most suitable product for the fibre optics market may also be identified. (6 refs.)

103105 Fluoride glasses of 3d transition metals. C.Jacoboni, A.le Bail, R.de Pape (Lab. des Fluorures et Oxyfluorures Ioniques, Faculte des Sci., Le Mans, France).
Glass Technol. (GB), vol.24, no.3, p.164-7 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Large vitreous areas have been found in PbF_2-MF_2-MF_3 systems (M=3d transitional element). The chemical and thermal conditions of preparation are given. These glasses exhibit interesting physical properties: good infrared transparency up to 7.5 μm for 3 mm thickness, luminescence with rare earth ions, and spin glass behaviour for high Mn^{2+}/Fe^{3+} content. Furthermore, the octahedral coordination of 3d glass former ions gives a structural originality for these glasses as compared with fluoroberyllate or fluorozirconate glasses which are built on different coordinations. 103106 Development and application of growth models for grain boundary allotriomorphs of a stoichiometric compound in ternary systems. T.Ando (Colorado School of Mines, Golden, CO, USA), G.Krauss.
Metall. Trans. A (USA), vol.14A, no.7, p.1261-9 (July 1983).
A model for the isothermal growth of grain boundary allotriomorphs of a stoichiometric phase, $(M, N)_aI_b$, with a nonsingular interface in a ternary M-N-I matrix is developed. The element I is assumed to diffuse orders of magnitude faster than element N. The growth model assumes two initial no-partition growth stages and a subsequent partition growth stage with respect to element N. Both planar and spherical film geometries of allotriomorphs are considered. Strict mass balance conditions are taken into account so that the model can be used in rigorous computer simulations. A method to correct the allotriomorph thickness for the specific volume difference of the matrix and the precipitate is also shown. The growth of cementite allotriomorphs in Fe-Cr-C austenite is computer-simulated with the developed growth model. Interfacial concentration terms were calculated by programming the Sharma-Purdy-Kirkaldy regular solution model for the Fe-Cr-C system. (25 refs.)

103107 Kinetics of nitrogen dissolution in high-chromium melts of the iron chromium system. S.V.Bezobrazov, A.G.Ponomarenko, V.I.Khyakkinen.
Russ. Metall. (GB), no.4, p.36-41 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.45-50 (1981). [received: June 1983]
A decrease in the oxygen current of liquid ferrochrome (60% Cr) from 0.20 to 0.07% increases the rate of dissolution of nitrogen in ferrochrome by more than five times. The dissolution of nitrogen is greatly reduced if the alloy contains more than 0.12-0.15% oxygen. An increase in the temperature of the metal accelerates the dissolution of nitrogen. The rate of absorption of nitrogen by ferrochrome depends on the crucible material. In a MgO crucible, this rate is higher than in an Al_2O_3 crucible. In a silica crucible, ferrochrome does not absorb nitrogen. For any oxygen content of the alloy, the rate of dissolution of nitrogen in the alloy is described by a first-order kinetic equation. (23 refs.)

103108 Effects of coherency constraints on phase equilibria. J.W.Cahn (Center for Materials Sci., NBS, Washington, DC, USA), F.C.Larche.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.311-14
Discusses the differences between coherent and incoherent phase equilibria. Observations of what phases exist in coherent equilibrium lead to fields whose boundaries could be depicted on phase diagrams, while observations of compositions of coherently coexisting phases will show that they depend on volume fractions and thus are not easily depicted in phase diagrams. The authors suggest that the phase diagram show only coherent diagram lines that depict boundaries between fields in which there are different sets of coexisting phases. (3 refs.)

103109 δ-γ phase equilibria in iron-rich iron-chromium-nickel alloys at temperatures between 1200 and 1350°C. R.Mundt, H.Hoffmeister (Lab. fur Werkstoffkunde und Schweisstech., Hochschule der Bundeswehr, Hamburg, Germany).
Arch. Eisenhuettenwes. (Germany), vol.54, no.6, p.253-6 (June 1983).
The δ-γ phase equilibria of iron-rich iron-chromium-nickel alloys with 23 to 38% Cr, 7 to 22% Ni are established at temperatures from 1200 to 1350°C. The effect of chemical compositions and annealing temperatures on equilibrium δ ferrite fraction is discussed. (12 refs.)

103110 Estimation of T_0-curves from existing phase diagrams. L.Katgerman (Dept. of Metals Sci. & Technol., Delft Univ. of Technol., Delft, Netherlands).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.444-6 (Aug. 1983).
The authors show that by application of the regular-solution approximation together with solidus and liquidus compositions from the phase diagram reliable estimations of T_0-curves can be made which can be used in the rapid solidification research to predict formation of non-equilibrium states or diffusionless solidification. (12 refs.)

103111 Phase equilibria and thermodynamic data for the Cu-S system. A.T.Dinsdale, T.G.Chart, T.I.Barry (Div. of Materials Applications, NPL, Teddington, England), J.R.Taylor.
High Temp.-High Pressures (GB), vol.14, no.6, p.633-40 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
Phase diagrams of metal-sulphur systems are required for an understanding of the processes involved in the extraction of metals from sulphide ores. The techniques used for the calculation of multicomponent alloy phase diagrams from thermodynamic data of binary systems are now well established. However, for metal-sulphur systems the representation of the thermodynamic properties as a function of composition must take account of the ordering induced by the strong interactions between the component elements. A partial assessment of the Cu-S system is presented which uses a two-sublattice description for the properties of the liquid phase. The application of these results to the calculation of the Cu-Fe-S phase diagram is described briefly. (49 refs.)

103112 Precipitation in a Cu-20%Ni-8%Sn alloy and the phase diagram of the Cu-Ni rich Cu-Ni-Sn system. M.Miki, Y.Ogino (Dept. of Materials Sci., Himeji Inst. of Technol., Himeji, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.602-10 (July 1983). In Japanese.
The precipitation sequence in a Cu-20 mass%Ni-8mm mass%Sn alloy on aging at temperatures between 623 and 723K after quenching from 1123K and the equilibrium phase diagram at 823K of the Cu-Ni rich Cu-Ni-Sn system were investigated by means of optical and electron microscopic observations, X-ray analysis and hardness measurements. The equilibrium precipitate phase in a Cu-20%Ni-8%Sn alloy was δ phase (β-Cu_3Ti type) with the lattice parameters of $a=0.451$, $b=0.538$ and $c=0.427$ nm. The precipitation sequence of the alloy is given. The values of apparent activation energy for intragranular and cellular precipitation of this alloy are 170 and 180 kJ/mol, respectively. The phase boundaries among $(\alpha+\gamma(DO_3))$, $(\alpha+\gamma+\delta)$, $(\alpha+\delta)$, $(\alpha+\delta+\theta(DO_{19}))$ and $(\alpha+\theta)$ regions at 823K in the Cu-Ni rich Cu-Ni-Sn system were determined. (32 refs.)

103113 Computer calculation of ternary phase diagrams. Seh Kwang Lee, Dong Nyung Lee.
J. Korean Inst. Met., vol.21, no.4, p.371-9 (April 1983). In Korean.
A computer program has been developed which is capable of calculating phase boundaries in a ternary system with multiple phases when binary thermodynamic data are known. The important features of the program are as follows: (1) The binary data are expressed in the form of Redlich-Kister equation or Legendre polynomial (2) The ternary free energy of mixing is calculated using three different model equations which are equivalent to Kohler, Toop and the shortest distance composition path equations. (3) The phase boundary is determined by minimizing the ternary free energy of mixing using simplex and hill-climbing methods. The calculated phase diagrams of the Co-Ni-Fe system at 873K and 1073K and of the Cr-Ni-Fe system at 1373K are discussed in comparison with the measured ones. (26 refs.)

103114 Calculation of the partial molar properties of ternary alloys from binary data using the shortest distance composition path. Dong Nyung Lee, Seh Kwang Lee (Dept. of Metallurgical Engng., Seoul Nat. Univ., Seoul, Korea).
Scr. Metall. (USA), vol.17, no.7, p.861-6 (July 1983).
Two expressions for the excess partial molar free energy of mixing in ternary solutions derived by Jacob and Fitzner (1977) and Lee (1982) based on the shortest distance composition path are not the same. The Lee equation only is consistent with the expression for the integral property derived on the basis of the same composition path. The activities in the Bi-Cd-Pb system at 773K, the Sn-Cd-Pb system at 773K, the Ag-Pb-Au system at 1200K and the As-Sn-Pb system at 1073K calculated using the Lee equation are in better agreement with the measured ones than values determined using the Kohler (1960) and the Toop (1965) equations. (17 refs.)

103115 Simple solution approaches in phase diagram evaluation. L.Kaufman (ManLabs Inc., Cambridge, MA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.105-6
Summary form only given. A brief review of approaches to phase diagram evaluation since 1966 is presented. Includes the prediction of regular solution interaction parameters from simple models, and lattice stability via computer methods to calculate binary and ternary phase diagrams. (19 refs.)

103116 Coherent phase diagrams in the cluster variation approximation. D.De Fontaine (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.149-62
Coherent phase diagrams are defined as pertaining to equilibria between phases which differ from one another merely by the distribution of different types of atoms on fixed crystallographic sites. Resulting ordered structures must then all be superstructures of one parent lattice, and corresponding phase diagrams are isomorphous to those of the Ising model with non-vanishing magnetic field. Rather complex phase diagrams can then be obtained from a single free energy functional by means of the cluster variation method. Calculated phase diagrams will be shown for the case of the FCC parent lattice with various positive and negative ratios of the values of second-to-first-neighbor pair interactions, this ratio being the only parameter which enters the calculation. Results will be compared to those of Monte Carlo calculations. (28 refs.)

103117 The mutual influence of magnetic and chemical ordering. G.Inden (Max-Planck-Inst. fur Eisenforschung GmbH, Dusseldorf, Germany).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.175-88
Model calculations are presented involving the mutual influence of magnetic and chemical ordering reactions in binary alloys. The critical temperatures in Fe-Si, Fe-Al and Co-Pt alloys are discussed on the basis of the model calculations. An empirical formulation of the ordering part of the specific heat capacity is used to calculate the phase equilibria in Fe-Si and Fe-Al alloys. (38 refs.)

103118 Magnetic ordering and phase separation in binary alloys with one magnetic component. J.L.Moran-Lopez (Dept. de Fisica, IPN, Mexico City, Mexico).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.189-93
Magnetic ordering and phase separation in binary alloys with one magnetic component are studied within the mean field approximation. The influence of ferromagnetic ordering on the phase separation temperature (T_{CS}) is examined in detail. In general it is found that magnetism increases T_{CS} and causes strong asymmetries in the phase diagram. In particular, it is found that in systems with only ferromagnetic interactions, the Curie temperature (T_{CM}) and T_{CS} are the same. Results for the phase diagrams and for the temperature dependence of the magnetic and spatial order parameters are presented. (7 refs.)

103119 A thermodynamic approach to the calculation of the C-Cr-Nb-Ni-W phase diagram. P.Y.Chevalier, J.N.Barbier, I.Ansara (Lab. de Thermodynamique et Physico-Chimie Metall., ENSEEG, Saint Martin D'Heres, France).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.211-16
The phase boundaries of the C-Cr-Nb-Ni-W system are calculated from the available thermodynamic properties of the limiting binary systems. The methods of calculation and the models used in the description of the ternary and quaternary systems are presented as well as the influence of tungsten on the solubility of the $M_{23}C_6$ phase in the nickel rich alloys. (9 refs.)

103120 Relationships between phase diagrams, the T_0 and T_n temperatures, cooling rates and glass forming ability. T.B.Massalski, C.G.Woychik (Dept. of Metall. Engng. & Materials Sci., Carnegie-Melon Univ., Pittsburgh, PA, USA), J.L.Murray.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.241-7
Models are constructed of the crystallisation process competing with glass formation in alloy systems. The depression of the nucleation temperature by rapid cooling is discussed. The nucleation model is applied to a $Cu_{50}Ti_{50}$ alloy. (10 refs.)

103121 Thermodynamic factors in the extension of solid solubility in Al-based alloys. J.L.Murray (Metall. Div., NBS, Washington, DC, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.249-62
Stable and metastable equilibrium diagrams and T_0 curves are calculated for the Al-based binary systems Al-Ga, Al-Ge, Al-Fe, Al-Mg, and Al-Si. Extended solid solubilities and metastable phases have been produced by rapid solidification for each of these systems, and the calculations are compared to experimental observations. (33 refs.)

103122 Crystal chemistry of metastable alloy phases. B.C.Giessen (Dept. of Chem., Northeastern Univ., Boston, MA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.263-4
Summary form only received. Metastable alloy phases that can be prepared by rapid liquid quenching are discussed. The phase diagram representation of metastable phases is examined. Examples of ordered and disordered metastable alloy phases are given. (15 refs.)

103123 Paraequilibrium and other restricted equilibria. M.Hillert (Div. of Phys. Metall., Royal Inst. of Technol., Stockholm, Sweden).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.295-310
After a review of the historic development of the concept of paraequilibrium in the field of alloy steels, the basic principles of restricted thermodynamic equilibrium at a migrating interface during phase transformaions are outlined. As a demonstration they are first applied to classical nucleation. In addition to the case of paraequilibrium they are then applied to adiabatic and to isochoric conditions. It is argued that a full equilibrium model, with a spike of the intensive property in front of the migrating interface may be more realistic. It is shown that the full equilibrium conditions require about twice as much undercooling or underpressure as the restricted equilibrium conditions because of the consumption of driving force in the spike. The concept of restricted equilibrium only applies to heterogeneous phase transformations. For homogeneous reactions, the same experimental conditions will give full equilibrium. (24 refs.)

103124 Thermodynamics of Na_2CO_3-$CaCO_3$-CaO slags for use in hot metal refining. P.Taskinen (Helsinki Univ. of Technol., Inst. of Process Metall., Espoo, Finland), D.Janke.
Arch. Eisenhuettenwes. (Germany), vol.54, no.5, p.175-80 (May 1983).
Measurements are made on the solubility of $CaCO_3$ and CaO in molten Na_2CO_3-$CaCO_3$ mixtures at 950-1400°C and $p_{CO_2}=1$ bar. The solution thermodynamics of Na_2CO_3-$CaCO_3$ slags are discussed for use in the refining of hot metal. (23 refs.)

103125 Calculation of quasibinary and quasiternary oxynitride systems. L.Kaufman, F.Hayes, D.Birnie (ManLabs Inc., Cambridge, MA, USA).
High Temp.-High Pressures (GB), vol.14, no.6, p.619-31 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
Phase diagrams for the quasibinary systems Si_3N_4-SiO_2, Y_2O_3-Si_3N_4, Y_2O_3-SiO_2, Ce_2O_3-Si_3N_4 and Ce_2O_3-SiO_2 are recalculated to illustrate a method by which these and more complex equilibria can be elucidated from thermodynamic data. New results for the quasiternary systems SiO_2-MgO-Si_3N_4, SiO_2-Y_2O_3-Si_3N_4, and SiO_2-Ce_2O_3-Si_3N_4 are derived from these phase diagrams and presented as component pairwise equilibria and complete isothermal sections of the appropriate ternary phase diagrams. These sections are compared with experimental data from the literature, and good agreement was obtained in the cases of SiO_2-MgO-Si_3N_4 and SiO_2-Ce_2O_3-Si_3N_4. (13 refs.)

103126 Study of the PbTe-Tl_2Te system. Evidence of a phase derived from Tl_5Te_3. R.Chami, J.-C.Tedenac, G.Brun, M.Maurin (Univ. Sci. & Tech. du Languedoc, Montpellier, France).
Mater. Res. Bull. (USA), vol.18, no.7, p.803-8 (July 1983). In French.
The thallium-lead tellurium system has been investigated by thermal analysis and X-ray diffraction methods. The cross-section PbTe-Tl_2Te seems to be a quasibinary one. An intermediate phase of stoichiometry Tl_4PbTe_3 has been evidenced. This phase, which decomposes peritectically at 594°C, and its stannous homologous, has been studied by comparison with Tl_5Te_3. (10 refs.)

103127 $V_{3.2}W_{1.8}O_{13}$ and studies of the V_2O_5-WO_3-VO_2 ternary system. R.J.Cava, D.J.Kleinman, S.M.Zahurak (Bell Labs., Murray Hill, NJ, USA).
Mater. Res. Bull. (USA), vol.18, no.7, p.869-73 (July 1983).
The tungsten/vanadium ratios for the known ternary compounds in the V_2O_5-WO_3-VO_2 chemical system are characterized. The compounds $V_{2.5}W_{0.5}O_7$ and $V_2WO_{7.5}$ are the $n=m=3$ and $m=m=4$ members of a series of M-niobia like crystallographic shear structures. The authors have found the $n=m=5$ member of the series at the composition $V_{3.2}W_{18}O_{13}$, and report its crystallographic unit cell, powder X-ray diffraction pattern and range of temperature stability. (11 refs.)

103128 Phase equilibria in the Mn-Fe-O system in CO_2-H_2 mixtures. K.Terayama, M.Ikeda (Dept. of Metall., Toyama Univ., Toyama, Japan), M.Taniguchi.
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.514-17 (July 1983).
In order to establish the detailed phase equilibria of the Mn-Fe-O system, a manganese ferrite, $MnFe_2O_4$ was studied at several temperatures between 1153 to 1273K by varying the oxygen partial pressures. The thermogravimetric and quenching methods were adopted, and the oxygen partial pressures in an atmosphere of a CO_2-H_2 mixture were measured by means of a solid electrolyte cell which was composed of $(ZrO_2)_{0.85}(CaO)_{0.15}$. A wide nonstoichiometric range is seen in the phase of $MnFe_2O_4$, where the value of x in MnO.2(FeOx) ranges from 1.360 to 1.500 at 1153K. The solid solution, which is stable in the oxygen partial pressures between $10^{-13.2}$ to $10^{-15.8}$ Pa at 1153K, is converted into a mixture of MnO and metallic iron at much lower oxygen pressures. (14 refs.)

103129 Influence of melt flow on the growth directions of columnar grains and columnar dendrites. K.Murakami, T.Fujiyama, A.Koike, T.Okamoto (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
Acta Metall. (USA), vol.31, no.9, p.1425-32 (Sept. 1983).
Aluminum-copper alloys containing 0.5 to 3.9 mass% Cu were unidirectionally solidified in flowing melt at flow rates ranging from 4 to 40 cm/s and the deflection angle of the crystal growth direction in the upstream direction was measured as functions of the flow rate and the copper content. The mode of the crystal growth is equivalent to one in which crystals encounter a fluid flow after having grown some distance in a stagnant melt. Although deflection angles for both columnar grains and columnar dendrites composing the grain increase with increasing flow rate, they show different dependence on the flow rate and on the copper content. (20 refs.)

103130 Examination of M_7C_3 carbides in high chromium cast irons using thin foil transmission electron microscopy. J.T.H.Pearce (Dept. of Metall., West Bromwich Coll. of Commerce & Technol., Wednesbury, England).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.428-32 (Aug. 1983).
Both as-cast and heat treated structures have been examined by thin foil transmission electron microscopy. Some initial observations are presented on the eutectic and secondary M_7C_3 carbides. (8 refs.)

103131 A schematic mechanism for striated growth of solid binary mixtures. B.Caroli, C.Caroli, B.Roulet (Ecole Normale Superieure, Univ. Paris VII, Paris, France).
J. Phys. (France), vol.44, no.8, p.945-51 (Aug. 1983).
It is shown, on the basis of a schematic model derived from that set up for the growth of plagioclase rocks by Haase et al. (1980), that the interplay between diffusional transport and two slow molecular attachment kinetics in non-linear competition is sufficient to account for the possibility of striated growth (i.e. growth of a solid binary mixture with planar periodic composition oscillations in the growth direction). (8 refs.)

103132 Computer simulation on the structure solidified by rapid cooling for Al-Pb alloys. T.Ikeda (Production Systems Engng., Toyohashi Univ. of Technol., Toyohashi, Japan), S.Nishi.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.631-8 (July 1983). In Japanese.
The development of a software was carried out for the solidification phenomenon of rapid cooling. The computer simulation by the software can estimate the effect of the solidification by rapid cooling and the solidified structure for Al-2 to 8 mass%Pb alloys. An outline of the simulation is given. The cooling process by successive temperature steps was applied to the continuous cooling process in the solidification. The solidification and reaction process were analyzed by four proposed models. In the phase separation reaction, $L_1 \rightarrow L_2{}^2+(L_1)$, spherical liquid phases $L_2{}^s$ of CH%Pb are randomly distributed throughout the liquid phase L_1 of CL%Pb, and the liquid L_1 around the $L_1/L_2{}^s$ interface can be supercooled by ${}^i\Delta T_1$. A total amount of the liquid $L_2{}^s$ increases as the coarsening and sifting-out growth proceed. In the monotectic solidification, $L_1 \rightarrow Al+L_2{}^m+(L_1)$, the solid phase aluminium is nucleated in the liquid L_1 supercooled by ΔT_m due to rapid cooling. (13 refs.)

103133 An analysis of the solidification of a binary eutectic system in consideration of both heat and solute diffusion. K.Takeshita (Dept. of Mech. Engng., Fukui Univ., Fukui, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.647-53 (July 1983). In Japanese.
The solidification problem of a binary eutectic alloy has been treated taking both heat and solute transport into account. A numerical solution for the freezing region is matched at two moving boundaries, through a simplex method for function minimisation, with analytical solutions obtainable for a pure solid or a pure liquid region. As the results of calculation, it is possible to obtain the amount of solute diffusing toward the pure liquid region, the temperature profiles within the regions, the velocities of two moving boundaries and the distribution of solid fraction within the freezing region. The results of calculation are compared with the experimental results of solidification using the H_2O-NH_4Cl eutectic system. (7 refs.)

103134 Microstructural origin of the skeletal ferrite morphology of austenitic stainless steel welds. J.A.Brooks (Sandia Nat. Labs., Livermore, CA, USA), J.C.Williams, A.W.Thompson.
Metall. Trans. A (USA), vol.14A, no.7, p.1271-81 (July 1983).
Scanning transmission electron microscopy (STEM) was conducted on welds exhibiting a variety of skeletal, or vermicular ferrite morphologies in addition to one lathy ferrite morphology. These ferrite morphologies result from primary ferrite solidification followed by a solid state transformation upon cooling. During cooling, a large fraction of the ferrite transforms to austenite leaving a variety of ferrite morphologies. Comparison of composition profiles and alloy partitioning showed both the skeletal and lathy ferrite structures result from a diffusion controlled solid state transformation. However, the overall measured composition profiles of the weld structure are a result of partitioning during both solidification and the subsequent solid state transformation. (31 refs.)

103135 Microstructure and mechanical properties of rapidly quenched $L1_2$ alloys in Ni-Al-X systems. A.Inoue (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), H.Tomioka, T.Masumoto.
Metall. Trans. A (USA), vol.14A, no.7, p.1367-77 (July 1983).
Ductile $L1_2$-type γ' compounds with rather high strengths and large elongations have been found in rapidly quenched Ni-Al-X (X=Cr, Mn, Fe, Co, or Si) ternary systems. The γ' compounds consist of a metastable phase which contains numerous antiphase domains (APDs) with a size as small as about 50 to 75 nm. Further, the ductile γ' wires with circular cross section have been manufactured directly from the liquid state by an in-rotating-water spinning method. The H_v, σ_y, σ_f, and ϵ_p of the γ' wires are about 240 to 400 DPN, 390 to 590 MPa, 580 to 910 MPa, and 4 to 10 pct, respectively, for Ni-Al- (Cr, Fe, Co, or Si) systems and about 220 DPN, 260 MPa, 440 MPa, and 27 pct, respectively, for the Ni-Al-Mn system. A cold drawing causes a significant increase in σ_y and σ_f and the attained values are about 2450 MPa and 2480 MPa, respectively, for Ni-20Al-10Cr wire drawn to about 90 pct reduction in area. Around the temperatures where the antiphase boundaries (APBs) disappear on annealing, the H_v, σ_y, σ_f, and ϵ_p of the γ' wires decrease significantly accompanied with a drastic change in fracture surface morphology from a transgranular type to an intergranular type. It has been therefore inferred that the high strengths and good ductility of the melt-quenched γ' compounds are due to the structural changes to a low degree of ordered state containing a high density of APB and the suppression of grain boundary segregation. (9 refs.)

103136 Influence of solidification parameters on mechanical properties and thermal stability of Fe-Ni-B metallic glasses. U.Koster (Univ. Dortmund, Dortmund, Germany), U.Herold, H.-G.Hillenbrand.
Scr. Metall. (USA), vol.17, no.7, p.867-72 (July 1983).
Results are presented on the influence of the solidification parameter on ribbon surface topography, mechanical properties and crystallization behaviour of Fe-Ni-B glasses. The effects are considered of quenching wheel surface velocity u, melt temperature T_m and pressure conditions during casting. (15 refs.)

103137 Use of metastable phase diagrams in rapid solidification. J.H.Perepezko (Dept. of Metall. & Mineral Engng., Univ. of Wisconsin, Madison, WI, USA), W.J.Boettinger.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.223-40
During rapid solidification, the nucleation and/or growth of a thermodynamically stable phase may be difficult. In this case the liquidus, solidus or other thermodynamic data for a metastable phase are important for the interpretation and prediction of the phases present in rapidly solidified materials. Various techniques are described to obtain information about metastable equilibrium from measured stable equilibrium data. Extrapolations of phase boundaries as functions of temperature, pressure or composition (including a new component) into regions of metastability can often be constructed directly on the equilibrium diagram. These constructions can be performed more quantitatively with analytical methods using thermodynamic modelling of the free energy functions consistent with measured data. A number of examples are considered including a discussion of metastable liquid miscibility gaps, metastable eutectic and peritectic reactions, pressure diagrams and metastability in ternary alloys to indicate the possible product phase selection. A coupling of metastable phase diagrams with a solidification kinetics analysis can contribute towards effective alloy design and processing during rapid solidification. (52 refs.)

103138 Metastable phases in rapidly solidified aluminum-rich Al-Fe alloys. D.Shechtman (Johns Hopkins Univ., Baltimore, MD, USA), L.J.Swartzendruber.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.265-8
Aluminium-rich Al-Fe binary alloys up to and including Al_3Fe were prepared by melt spinning in order to study the metastable phase structure and its transformation following heat treatment. Transmission electron microscopy and nuclear gamma-ray resonance were utilized in the study. The rapidly solidified structure was found to contain up to three metastable phases. One of the phases, with a composition and a gamma-ray resonance spectrum appropriate for Al_6Fe, has either a globular or a cellular morphology upon quenching. (4 refs.)

103139 Phase stability in rapidly solidified iron and nickel-base alloys. J.Wood (Faculty of Technol., Materials Sci., Open Univ., Milton Keynes, Endland).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.269-75
The structure of a large range of model steels and high speed steels after rapid solidification are described in terms of the effect of processing conditions and alloy content. General lessons are deduced for these structures regarding the stability of austenite, ferrite, $\propto'$ and ϵ martensite, and excess carbon concentrations in rapidly solidified steels and these are compared with other workers' results. Some preliminary data regarding the structure of model nickel alloys are presented in order to shed light on previously described structures of nickel superalloys. (26 refs.)

103140 Influence of various forming treatments of the metastable austenite on the transformation behaviour of steels with high carbon content in bainite and martensite. E.Schmidtmann, D.Wirths.
Arch. Eisenhuettenwes. (Germany), vol.54, no.6, p.231-8 (June 1983).
Investigates the influence of the carbon content of high-strength steels, the austenitizing temperature and the amount of plastic deformation before transformation on the shape and size of bainite and martensite. The change of the M_s temperature and incubation times of the bainite treatment are discussed along with the influence on structure and residual austenite content. (28 refs.)

103141 X-ray diffraction analysis at high temperature on two ceramic systems. A.Benedetti, G.Fagherazzi (Istituto di Chimica Fisica, Univ. Ca Foscari, Venezia, Italy), S.Meriani.
J. Mater. Sci. (GB), vol.18, no.8, p.2510-16 (Aug. 1983).
The β-eucryptite/β-spodumene phase transition in glass fibres of a SiO_2-Al_2O_3-Li_2O-MgO-ZnO-K_2O-P_2O_5 system and the crystallization of a ZrO_2-CeO_2 solid solution have been studied in situ, at high temperature, using a special home-made thermal attachment for X-ray powder vertical diffractometers. The β-eucryptite/β-spodumene transition was observed in the temperature range between 865 and 930°C. A significant unit cell shrinkage was observed for β-eucryptite from which it is possible to conclude that the first crystallized phase is surely an eucryptite-silica solid solution. This agrees with the small thermal effect shown by DTA for this crystalline transition. With the same high temperature attachment the evolution of the average crystallite size, L_{111}, was followed as a function of the thermal treatment in a 0.84 ZrO_2-0.16 CeO_2 tetragonal structured solid solution. (18 refs.)

103142 Phase transformation and magnetic properties of Mn-Al-C permament magnets. Su-Hong Park (Dept. of Metall. Engng., Yonsei Univ., Seoul, Korea), Chan-Young, So Dong-Hi Lee.
J. Korean Inst. Met., vol.21, no.4, p.401-6 (April 1983). In Korean.
The specimens had compositions of 70 wt.% Mn, 28-29 wt.% Al and three different carbon contents (0.48 wt.%, 0.92 wt.%, 1.24 wt.%). After being solutionized at 1100°C for 3 hr, the specimens were quenched into oil maintained at room temperature and then annealed in a salt bath for the various period of time at the predetermined temperatures ranging from 400°C to 700°C. Their phase transformations and magnetic properties were investigated. The specimen with 0.48 wt.%C showed the best magnetic properties when annealed for 60 to 120 min. at 550°C. It was believed that the ϵ to τ phase transformation was overshadowed by the decomposition of τ into β-Mn and γ phase. The specimen with 1.24 wt.%C which is more than two times of carbon solubility of τ phase (0.48 wt.% C), showed the highest values of $(BH)_{max}$ when compared with the others. The reason for it is believed to be resulted from a particular morphology of carbide precipitates, i.e. repeated lamellar structures of Mn_3AlC in the τ phase. This type of structure seems to inhibit the decomposition process of τ phase to β-Mn phase in addition to the negative effct on the domain wall motion in that phase by pinning it. (10 refs.)

103143 Influence of microstructure on the alpha-gamma transformation of iron. A.Couture (Dept. of Mining & Metall., Laval Univ., Quebec, Canada), R.Angers.
Metall. Trans. A (USA), vol.14A, no.7, p.1511-12 (July 1983).
Observations about the influence of grain size on the alpha-gamma transformation of iron are reported. The observations were made on cylindrical Armco iron samples thermally cycled through the transformation between 870 and 964°C at the rate of 0.12°C per second in a DTA apparatus. (37 refs.)

103144 Ferrite formation in heterogeneous dual-phase steels. H.K.D.H.Bhadeshia (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).
Scr. Metall. (USA), vol.17, no.7, p.857-60 (July 1983).
Many properties of dual-phase steels depend on the volume fractions V and $(1-V)$ of ferrite (α) and martensite, respectively, in the microstructure. The desired microstructure can be obtained by the isothermal transformation of austenite (γ) in the $\alpha+\gamma$ phase field, followed by rapid cooling to ambient temperature so that any remaining γ decomposes martensitically. An investigation was made of the paraequilibrium formation of ferrite in 'banded' Fe-Mn-C steels, i.e. steels which are compositionally heterogeneous, as is usually the case in commercial practice. 103145 Thermodynamic condition for the formation of athermal martensite. D.A.Mirzaev (Lenin Komsomol Polytech. Inst., Chelyabinsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1228-30 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
It is shown that the thermodynamic condition for the formation of athermal martensite is somewhat different than that for isothermal martensite (crystals of the former appear in $\sim10^{-7}$ sec, which excludes the possibility of heat exchange in the course of the martensitic transition). The adiabatic term in the thermodynamic 'stimulus' is calculated for Fe-Ni alloys with nickel concentrations in the range 28-32 at.%. It is found that an increase in the nickel concentration reduces the adiabatic term because of a reduction in the thermal effect of the martensitic transition. (6 refs.) *A.T.*

103146 The effect of thermal cycling on the thermoelastic martensitic transformation in a Cu-Zn-Al alloy. Jian-Chun Li (Dept. of Materials Engng., Rensselaer Polytech. Inst., Troy, NY, USA), G.S.Ansell.
Metall. Trans. A (USA), vol.14A, no.7, p.1293-7 (July 1983).
The effect of thermal cycling between the M_f-A_f on the thermal hysteresis, temperature dependence, and the morphology of the martensitic transformation in a Cu-Zn-Al alloy was studied. The hysteresis behavior of the cyclic transformation, as characterized by following the change in electrical resistivity accompanying the transformation changed in two respects: First, the M_s and A_f temperature shifted to higher temperatures while the M_f and A_s temperatures remained constant. Second, the amount of martensite undergoing cyclic transformation decreased. These changes appeared to saturate at 300 cycles and could be partly recovered during room temperature aging. The morphology and mode of transformation also changed. During the first few cycles, transformation occurred in two simultaneous ways: (1) as martensite plates which are observed to grow and thicken in a continuous manner and (2) as plates which form in a 'burst' process. After 60 cycles no 'burst' type transformation occurred during cooling and plate growth and thickening was stepwise. (6 refs.)

103147 Effects of a pulsed high magnetic field on the M_s temperature and martensite morphology in an Fe-31.7 at.%Ni alloy. T.Kakeshita, K.Shimizu (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan), T.Sakakibara, S.Funada, M.Date.
Scr. Metall. (USA), vol.17, no.7, p.897-900 (July 1983).
A study has been done to examine the morphology of martensites induced by a magnetic field and also to study the exact effect on M_s temperature in an Fe-Ni alloy. As a result of the study, different results have been obtained from those in Fe-Ni-C alloys, and the results are reported briefly. (6 refs.)

103148 Cooperative effects between γ'_1 and β'_1 martensites in a Cu-15.0 at.%Sn alloy. N.Kuwano, C.M.Wayman (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.499-503 (July 1983).
Electron microscopy observations have been carried out to study some characteristics of martensites formed in a Cu-15.0 at.%Sn alloy which was subzero treated. It was found that an 18R-martensite (β'_1) is formed at the interface between the 2H-martensite (γ'_1) and the parent phase (β_1). The volume of the 18R-martensite increases upon heating. The β'_1 martensite appears to form as a result of stress-assistment from the γ'_1 martensite. The coexistence of the two martensites is believed to be a major cause of the sensitive dependence of the A_s and A_f temperatures upon the heating rate in this alloy. (11 refs.)

103149 Microstructural changes in an aged Cu-15 at.%Sn shape memory alloy. N.Kuwano, C.M.Wayman (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.504-9 (July 1983).
Microstructural changes were studied by means of electron microscopy for a Cu-15.0 at.%Sn alloy aged at 373K or 323K. The as-quenched alloy was confirmed to consist of many small domains of an ω-like phase (designated as the s-phase) and a DO_3 matrix. It was observed that in the alloy aged at 373K another phase (designated as the L-phase) precipitates preferentially on dislocations and coarsens to larger than 0.2 μm in diameter. In the alloy aged at 323K the L-phase was formed, but then decomposed into small irregular segments upon subsequent aging. After aging below 323K for a prolonged time, both the s- and L-phases underwent alteration to a transitional phase which showed additional extra diffraction spots. The precipitation of the L-phase is believed to be responsible for the decrease in the martensite transformation temperature (M_s) upon aging. (15 refs.)

103150 Hydride precipitation in α/β zirconium alloys. V.Perovic (Dept. of Metall. & Materials Sci., Univ. of Toronto, Toronto, Canada), G.C.Weatherly, C.J.Simpson.
Acta Metall. (USA), vol.31, no.9, p.1381-91 (Sept. 1983).
The precipitation of δ-hydride ($ZrH_{1.5}$) in fine-grained α/β zirconium alloys has been studied. Both interphase and transgranular hydrides are observed, the mechanism of growth being dependent on the nature of the α/β interface. Macroscopic hydrides observed in the optical microscope are always composed of stacks of smaller hydride plates with habit planes close to the basal plane. The apparent habit plane of the macroscopic hydride plate is determined by the geometry of the stack. The stability of different hydride stacks is considered and the role of the texture of the alloy and of a stress (external or internal) acting on the basal planes in determining the orientation of the stacks is explained. (22 refs.)

103151 Interdendritic fluid flow normal to primary dendrite-arms in cubic alloys. K.Murakami, A.Shiraishi, T.Okamoto (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
Acta Metall. (USA), vol.31, no.9, p.1417-24 (Sept. 1983).
The permeability of interdendritic space was measured using translucent borneol-paraffin organic binary alloys having columnar dendrites whose morphology is the same as that of metallic alloys of FCC and BCC. In the experiment, an aqueous solution containing a small amount of red ink and 25 vol.% surface active agent was allowed to flow normal to columnar dendrites and it was ascertained that the flow was uniform. The permeability was proportional to the square of the primary dendrite-arm spacing and to the cube of the fraction liquid. This relation is in good agreement with the prediction based on a model assuming the interdendritic space to be an assembly of interstices each of which has a slenderly rectangular section. (3 refs.)

103152 Discontinuous coarsening reaction in lamellar precipitated Cu-Be alloys. H.Tsubakino, R.Nozato (Dept. of Metall. Engng., Osaka Univ., Osaka, Japan).
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.183-95 (1982).
The cell growth kinetics in a discontinuous coarsening reaction associated with discontinuous precipitation in Cu-Be alloys containing 1.4 and 2.1 wt.% Be have been studied principally by quantitative metallographic measurements. After the discontinuous precipitation is nearly complete, discontinuous coarsening reaction with a much coarser interlamellar spacing begins at the original grain boundaries. The α phase in the cells produced by discontinuous precipitation is supersaturated at the initial ageing stage, but attains its equilibrium value prior to the occurrence of the discontinuous coarsening reaction. Cold work does not influence the cell growth of the discontinuous coarsening reaction. The driving force for the discontinuous coarsening reaction is the reduction in total interlamellar surface energy. Variations in growth rate and interlameller spacing of the discontinuous coarsening reactor with ageing time were discussed in relation to a continuous coarsening reaction which occurs in the cells produced by discontinuous precipitation. (20 refs.)

103153 On the precipitation of β phase from α Cu-Be solid solution. H.Tsubakino (Dept. of Metall. Engng., Osaka Univ., Osaka, Japan).
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.197-206 (1982).
The morphology and the rate of the precipitation of β phase from supersaturated α solid solution and also the coarsening rate of β precipitate particles in Cu-2.04 wt.% Be alloy have been studied in the temperature range 898 to 973K. The precipitation of β phase takes place by continuous mode. The rate of coarsening of β precipitate particles (rod-like shape) obeys the $t^{1/3}$-law (where, t is ageing time) and are controlled by volume diffusion of Be in α phase. (14 refs.)

103154 Calculation of precipitation behaviour in an alloy steel using a thermochemical data bank and the program 'SOLGASMIX'. R.Gallagher, P.J.Spencer (Lehrstuhl fur Metall., Rheinisch-Westfalisch Tech. Hochschule Aachen, Aachen, Germany).
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.7, no.2, p.157-63 (April-June 1983).
The precipitates forming in an alloy steel at different carbon and nitrogen concentrations and at different temperatures have been calculated. The calculations have been carried out using the computer program SOLGASMIX in association with thermochemical values retrieved automatically from a data bank. The results provide information on the stabilities and amounts of the precipitated phases and also on the stoichiometry of the carbonitride phase $Nb(C_xN_y)$. (4 refs.)

103155 On solution-reprecipitation processes during liquid phase sintering of WC-Co. T.Schmitt, M.Schreiner, P.Ettmayer, E.Lassner, B.Lux (Inst. fur Chem. Technol. Anorganischer Stoffe, Tech. Univ. Wien, Wien, Austria).
Int. J. Refract. & Hard Met. (GB), vol.2, no.2, p.78-83 (June 1983).
Investigations were carried out on WC/Co hard metals with additions of coarse ($Mo_{0.4}W_{0.6}$) and Mo_2C powders. By means of the different solubilities of the three carbides in the Co binder, the grains could be shown to grow by a solution-reprecipitation process, phenomenologically similar to Ostwald ripening. The different etching behaviours of WC crystals with and without Mo and the analysis of the Mo and W distribution in the crystals with energy dispersive X-ray analysis supplied more information about chemical and structural changes in the crystals during the grain growth process. (31 refs.)

103156 X-ray diffraction investigation of the single-phase stage of precipitation of martensite. S.D.Prokoshkin, L.M.Kaputkina, M.L.Bernshtein, V.E.Mozzhukhin (Inst. of Steel & Alloys, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1150-9 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
X-ray diffractometry was used to study changes in the crystal structure of quenched high-carbon steels during the single-phase stage of precipitation of martensite in the course of low-temperature tempering. Formation of the tempering martensite in crystals due to the elastic reaction of the surrounding matrix resulted in an anisotropic angular shift of the X-ray diffraction lines of the martensite, which could easily be explained by postulating the appearance of stacking faults along {112} planes. This shift was not observed in the absence of such an elastic reaction of the matrix (in the case of electrolytically isolated martensite). A tetragonal distortion of the tempering martensite lattice was solely due to the presence and an ordered distribution of carbon atoms. (22 refs.) *A.T.*

103157 Decomposition processes in Al-Zn-Mg alloys. H.Loffler (Pedagogical Univ., Halle, Germany), I.Kovacs, J.Lendvai.
J. Mater. Sci. (GB), vol.18, no.8, p.2215-40 (Aug. 1983).
Surveys the present knowledge of the mechanisms of decomposition processes in Al-Zn-Mg alloys. The various experimental observations connected with the formation and properties of the different second phase particles are described and critically analysed. The effect of different heat treatments, compositions, impurities, etc. on the different stages of the decomposition process is discussed in detail. (186 refs.)

103158 On the kinetics of discontinuous precipitation in Cu-Mg alloys. H.Tsubakino (Coll. of Engng., Univ. of Osaka Prefecture, Sakai, Japan), K.Wada, R.Nozato.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.617-22 (July 1983). In Japanese.
The relation between the discontinuous precipitation and the continuous precipitation, and the kinetics of the discontinuous precipitation in Cu-Mg alloys containing 2.0, 2.6 and 3.2 mass%Mg have been investigated by metallographic observations and microhardness measurements. Variations in cell width and volume fraction of discontinuous precipitation cells with ageing time have been determined in the specimens aged at temperatures from 573K to 873K. The decomposition of Cu_2Mg from supersaturated solid solutions of magnesium in copper during ageing is initiated by a discontinuous precipitation and followed by a continuous precipitation. The cell growth is associated with the migration of a grain boundary. The cell growth rate decreases with ageing time progressively after the linear growth rate of cells. This decrease will be attributed to the influence of the continuous precipitation on the cell growth. The volume fraction of the discontinuous precipitation cells, f, can be represented by Johnson-Mehl type equation:$f=1-\exp(-bt^n)$, (where, t is the ageing time and b and n are constants). The value of the parameter n is 2 and independent of ageing temperature and alloy composition in the range of ageing time in which cell growth rates are constant. (14 refs.)

103159 Computer simulation on the reduction of gravity segregation for Al-Pb alloys by the rapid solidification method. T.Ikeda (Production Systems Engng., Toyohashi Univ. of Technol., Toyohashi, Japan), S.Nishi.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.639-46 (July 1983). In Japanese.
The programme of this computer simulation was made by the introduction of new numerical calculation method on gravity segregation in the computer simulation on the structure solidified by rapid cooling for Al-Pb alloys. The control of the gravity segregation by rapid cooling and the formation process were investigated by the present computer simulation. A mechanism of the gravity segregation of Al-Pb alloys is considered as the falling phenomenon of growing L_2 liquid phase during the separation and coexisting reaction. The falling behavior of L_2 depended on density difference between L_1 and L_2 or growth of L_2 at elevated temperatures and the viscosity of L_1 at temperatures below about 1123K. The rapid solidification method could decrease the gravity segregation of high lead alloys. In low lead alloys, the method was rapid in cooling enough to prevent the gravity segregation. For cooling rates of 50K/s to 10^3K/s, the calculated condition for the prevention of the gravity segregation was in agreement with the experimental one. (11 refs.)

103160 The influence of cobalt, iron and aluminium on the precipitation of metastable phases in the Ni-Ta system. S.E.Axter, D.H.Polonis (Dept. of Mining, Univ. of Washington, Seattle, WA, USA).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.151-61 (Aug. 1983).
The precipitation of the $L1_2\gamma'$ phase or the $D0_{22}\gamma''$ phase in Ni-Ta alloys can be controlled by additions of either cobalt or combinations of iron and aluminium. The substitution of 27-29 at.% Co for nickel in a basic Ni-10 at.% Ta alloy leads to γ'' precipitation, whereas alloys containing 29-43 at.% Co exhibit the bimodal precipitation of both the γ'' and the γ' phases. Alloys containing more than 42.6 at.% Co exhibit only the f.c.c. γ' precipitate. Additions of iron to Ni-Ta promote the precipitation of the face-centered tetragonal γ'' phase whereas the addition of the aluminum favors γ' precipitation. Appropriate combinations of aluminum and iron permit the simultaneous precipitation of both the γ'' and the γ' metastable phases. The alloy compositions corresponding to the appearance of these phases either separately or together in the form of bimodal precipitation can be anticipated from electron theory considerations, thereby providing a basis for microstructure control and alloy design. (26 refs.)

103161 Discontinuous γ' coarsening in a Ni-Al-Mo base superalloy. A.W.Funkenbusch (United Technol. Res. Center, East Hartford, CT, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1283-92 (July 1983).
Discontinuous coarsening in a Ni-Al-Mo base superalloy was studied emphasizing the influence of grain boundary misorientation. Nucleation and growth rates were determined as a function of temperature, time, and degree of misorientation for ⟨001⟩ twist boundaries. Both nucleation and growth were controlled by grain boundary diffusion and increased with twist angle and temperature. Grain boundary diffusivities (calculated assuming reduced γ' (surface energy) as the driving force) were more than one order of magnitude greater than those reported for static boundaries of similar misorientation. Consideration of atomic jump frequencies in static and dynamic boundaries indicated that the high diffusivities cannot be attributed to motion enhanced grain boundary diffusion. Rather, the high calculated diffusivities are interpreted to indicate the presence of additional driving forces for discontinuous coarsening in the Ni-Al-Mo base superalloys. Potential sources of additional driving force are presented. (22 refs.)

103162 Ageing study of magnesium oxide precipitates in a silver matrix. A.Charai, A.Combe, C.Boulesteix, J.Cabane (Lab. de Microscopie Electronique Appliquee ERA, Centre Sci. et Tech. de St.-Jerome, Marseille, France).
Scr. Metall. (USA), vol.17, no.7, p.833-6 (July 1983).
It is shown that the evolution of a magnesium oxide precipitate happens very slowly. For a temperature less than 650°C a large number of dislocations occur. After higher temperatures and a sufficiently long thermal treatment, coherent precipitates are observed. The ageing then proceeds by Oswald ripening mechanism. This ageing cannot be explained by free magnesium in solid solution; it is necessary to consider the magnesium bound to oxygen which is less mobile but in a much greater quantity. On the one hand, there would be magnesium oxide in the form of precipitates in equilibrium with a negligible amount of magnesium in solid solution, and on the other hand, magnesium bound to oxygen in a small quantity but however sufficient to explain the coalescence. (20 refs.)

103163 Coarsening process of Co precipitates in Cu-Co alloys. Y.Seno (Kyushu Univ., Fukuoka, Japan), Y.Tomokiyo, K.Oki, T.Eguchi.
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.491-8 (July 1983).
Ostwald ripening of precipitate particles in Cu-Co alloys was investigated by electron microscopic observation. Radii of individual particles were directly measured from their strain contrasts in the electron microscopic images for the alloys containing 1-4 at.%Co, and the variation of the mean particle size and the distribution of the relative particle size were obtained as functions of the aging time at 873K. A systematic change in the distribution with the aging time was observed, which suggested that the observed coarsening process did not reach the steady state as assumed in the theories of LSW and Ardell. The shape of the distribution of particle size is sharp and symmetrical around the mean particle size in the early stage of aging, while it becomes broad and asymmetrical with increase in the aging time. This change in the size distribution with the aging time differs from the expectation from the rate equation for individual particle growth in the LSW theory and from the experimental results of some Ni-based alloys. (22 refs.)

103164 Electron microscopy study of microstructural changes in a Ti-1.6 at.%N alloy. D.Sundararaman, A.L.E.Terrance, V.Seetharaman, V.S.Raghunathan (Metall. Programme, Reactor Res. Centre, Kalpakkam, India).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.510-13 (July 1983).
The early stages of decomposition of the supersaturated (α'') phase which was obtained on quenching a Ti-1.6 at.%N alloy have been found to be associated with characteristic microstructural features. The tetragonally ordered α' phase formed from α'' by continuous ordering, transforms to incoherent Ti_2N precipitates, on ageing in the temperature range 323-673K. While no perceptible growth of homogeneously transformed α' phase was observed in the matrix, lath boundary precipitation of α'/Ti_2N was found to take place during low temperature ageing ($T \leq 373K$). On ageing at high temperature ($T > 373K$) both matrix and lath boundary precipitation of Ti_2N occurred uniformly by the nucleation and growth process. The microstructural features observed during $\alpha' \rightarrow Ti_2N$ provide evidence for the predominance of continuous ordering at lower temperatures and the nucleation and growth process at higher temperatures. 81.40 TREATMENT OF MATERIALS AND ITS EFFECTS ON MICROSTRUCTURES AND PROPERTIES

103165 Ceramic materials stronger than steel. M.Lewis (Dept. of Phys., Univ. of Warwick, Coventry, England).
Elettrotecnica (Italy), vol.70, no.5, p.421-4 (May 1983). In Italian.
Ceramic materials being developed at present are so strong mechanically, and so resistant to corrosion and heat, that they will replace the conventional range, in, for example, parts of gas turbines and high speed tools for metal machining. The problems of production, types of ceramic compound with their crystallography, their applications and high-temperature stability are discussed. (no refs.) *J.S.*

103166 On the prediction of residual strength for notched laminates. G.Caprino (Istituto di Tecnologie, Univ. di Napoli, Naples, Italy).
J. Mater. Sci. (GB), vol.18, no.8, p.2269-73 (Aug. 1983).
The effectiveness of a two-parameter model based on linear elastic fracture mechanics concepts, is experimentally verified, using original results and data available from the literature. It is shown that the proposed model can be reduced to a one-parameter model, due to the constancy of the other parameter for fibre dominated laminates, irrespective of fibre and matrix materials and shape of the notch. A comparison with the well-known criteria proposed by Whitney and Nuismer (WN) shows that the WN models are useful for prediction of residual strength of notched laminates, provided the length of the notch is not too large; for large notches the two-parameter model reported seems to be more effective. (8 refs.)

81.40C Solid solution hardening, precipitation hardening, dispersion hardening

103167 New aspects on the appraisal of the cooling process during hardening of steel. K.-E.Thelning (Smedjebacken-Boxholm Stal AB, Boxholm, Sweden).
Scand. J. Metall. (Finland), vol.12, no.4, p.189-94 (1983).
When hardening tools and machine components the heat treater generally aims to obtain a martensitic structure at least in the surface layers of the steel. Hence the rate of cooling must be controlled so that the formation of ferrite, pearlite or bainite is avoided. Since the dimensions of the part have generally been decided beforehand the depth of hardness must be determined by a judicious choice of steel and cooling medium. With regard to the steel a knowledge of its hardenability is a good aid when choosing a suitable grade. For the cooling medium, however, there are not available the same good criteria concerning the cooling capacity of the medium. Hence the simple rule as usually applied; unalloyed steels are quenched in water, alloy steels in oil and high-alloy steels cooled in air. When it becomes desirable to introduce less sophisticated steel grades and more automation of the heat treating process, specialized knowledge is required, both of the hardenability of steel and the cooling capacity of cooling media. A successful final result is also due in large measure to the mutual interplay between these two factors. (9 refs.)

103168 Effects of surface and thickness of specimens on the aging in Al-Zn alloys. M.Ohta (School of Engng., Okayama Univ. of Okayama, Japan), T.Kanadani, A.Sakakibara, H.Yamada, M.Yamada.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K23-6 (16 July 1983).
The effects of surfaces and grain boundaries on the ageing and reversion in Al-Zn alloys is reported. Vickers hardness and electropolishing were used to characterise soft surface layers. The results suggest that the vacancy concentration during the period of age hardening near the surface was lower than that in the interior of the specimen. (1 ref.)

81.40E Cold working, work hardening; annealing, recovery and recrystallisation; textures

103169 HVEM study of recrystallisation in aluminium alloys containing second phase particles. S.Dermarkar (Aluminium Pechiney, Voreppe, France), P.Guyot, J.Pelissier.
Acta Metall. (USA), vol.31, no.9, p.1315-22 (Sept. 1983).
An investigation of the recrystallisation behavior of two Al alloys containing fine (Al-Fe) and coarse (Al-Si) particles is presented. In situ anneals in a 1

MeV electron microscope revealed different recrystallisation mechanisms in each case and allowed direct measurements of grain boundary velocities and subgrain sizes. Multiple nucleation around coarse particles is observed at 250°C for the Al-Si alloys. Conversely, small precipitates strongly pin a subgrain structure up to 400°C for the Al-Fe alloy. Grain boundary migration rates are compared to values deduced from bulk-annealed specimens for the Al-Si alloy. The stability of the subgrain structure in the Al-Fe alloy is discussed with respect to recent models. (14 refs.)

103170 Development of the recrystallization texture in tensile deformed aluminium single crystals. I HVEM observations. A.Berger, P.J.Wilbrandt, P.Haasen (Inst. fur Metallphys., Univ. Gottingen, Gottingen, Germany).
Acta Metall. (USA), vol.31, no.9, p.1433-43 (Sept. 1983).
Various stages of the recrystallization process of tensile deformed aluminium single crystals were investigated by means of HVEM and X-ray texture measurement. The deformed crystals have a simple microstructure consisting of 2 components. Samples were annealed under observation in the heating stage of the high voltage microscope. Recrystallization nuclei were observed to have orientations which were already present in the deformed microstructure. New orientations were generated by recrystallization twinning in a selection process favoring better coincidence orientations. A model for nucleation is proposed. (30 refs.)

103171 Nonlinear finite element analysis of an autofrettage process. E.T.Till, F.G.Rammerstorfer (Dept. of Sci. Computing, VOEST-ALPINE AG, Linz, Austria).
Comput. & Struct. (GB), vol.17, no.5-6, p.857-64 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Generally metal forming processes are nonlinear problems. A method is presented to calculate stress and deformation time history and residual states of a mechanically autofrettaged thick walled cylinder. The finite-element-model and the results of the nonlinear analysis are demonstrated. (5 refs.)

103172 Influence of the annealing temperature on changes in the properties of hydrogen-phase-hardened palladium exhibiting hydride brittleness. V.A.Gol'tsov, V.A.Kirillov, S.V.Gorban', O.I.Karnaukh, V.G.Volynskaya, N.A.Tikhonov (Polytech. Inst., Donetsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1165-8 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The annealing temperature influenced the changes in the electrical and mechanical properties of hydrogen-phase-hardened palladium in the hydride brittleness state. Annealing of $PdH_{0.16}$ resulted in the reverse $\beta \rightarrow \alpha$ hydride transition as well as in considerable changes in the composition and properties of PdH_x alloys. Outgassing produced a monophase-hardened state with a high value of the strength and poor plastic properties. Recrystallization of hydrogen-phase-hardened palladium was observed above 250°C. (4 refs.)
A.T.

103173 The metallurgy of continuous-annealed drawing-quality sheet steel. P.L.Mangonon,Jr. (METS Internat., Exton, PA, USA), B.L.Bramfitt.
J. Met. (USA), vol.35, no.5, p.27-32 (May 1983).
Continuous annealing can provide products for the automotive and appliance industries which exhibit more uniform mechanical properties, better shape (flatness), and cleaner surfaces than batch annealing. Continuous annealing (CA) is especially suited for the high-strength steel grades required by the automotive industry. Because of the rapid heating cycle encountered in continuous annealing, drawing-quality steels produced on a CA line do not have properties equivalent to steels produced by batch annealing (BA). However, the latest continuous-annealing technologies, combined with proper control of chemistry, have developed products with properties approaching those obtained with BA. The metallurgical concepts of these technologies are reviewed. (18 refs.)

103174 Orientation relationships in the secondary recrystallization of pure nickel. P.Lejcek, V.Sima (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.121-4 (Aug. 1983).
The preferred orientation relationship 19°, $\langle 100 \rangle$ was confirmed between the primary recrystallization texture and the large secondary grains grown during the unidirectional annealing of heavily deformed nickel. It was found that the rate of specimen movement affects the operational mode of the particular rotation axis. The twist rotation about $[\bar{1}00]$ corresponds to higher rates of specimen movement compared with the tilt rotation about the [001] axis which is effective at lower rates. The change in rotation axis might be explained by a higher value of the activation energy of migration for the twist-type grain boundary than for the tilt boundary. (10 refs.)

103175 The role of non-equilibrium grain boundary structure in strain induced grain boundary migration (recrystallization after small strains). R.Z.Valiev, V.Yu.Gertsman, O.A.Kaibyshev (Aviation Inst., Ufa, USSR).
Scr. Metall. (USA), vol.17, no.7, p.853-6 (July 1983).
The non-equilibrium GB structure plays an important role in recrystallization after small strains. Furthermore, non-equilibrium GBs must be of essential importance for recrystallization after large strains as well because in this case grain boundaries also have a non-equilibrium structure. This structure is a result of dislocations running-in during deformation and of the absorption of dislocations by the moving recrystallization front. The microstructure changes observed in a magnesium alloy during annealing after small strains are discussed. (15 refs.)

81.40G Other heat and thermomechanical treatments

103176 A deconcentrated plasma arc used for reducing concentrations of stresses. A.E.Asnis, G.A.Ivashchenko (E.O. Paton Welding Inst., Acad. of Sci., Ukrainian SSR).
Autom. Weld. (GB), vol.35, no.6, p.35-7 (June 1982). Translation of: *Avtom. Svarka (USSR)*, no.6, p.51-2 (1982).
It has been established that a deconcentrated plasma arc can be used for melting the boundaries of welds without employing a filler wire to eliminate concentrations of stresses in the regions of transition from weld into parent metal. The optimum treatment conditions have been determined. (2 refs.)

103177 The influence of annealing procedure on the mechanical properties of a C-Mn and a C-Mn-V dual phase steel. A.Hansson, R.Lagneborg, A.Melander (Swedish Inst. for Metals Res., Stockholm, Sweden).
Scand. J. Metall. (Finland), vol.12, no.4, p.177-83 (1983).
A C-Mn and a C-Mn-V steel with the same chemical composition except for vanadium has been subjected to various heat treatments used in practice to produce microstructures typical of dual-phase steels. The strength-elongation relationships represented by the data from these various heat treatments were virtually indentically for the C-Mn and the C-Mn-V steel. Tempering at 250°C did not affect the strength-elongation relationship, whereas tempering at 350°C produced somewhat inferior combinations of strength and elongation. The higher strength and the accompanying deterioration of elongation is partly due to strengthening from increasing contents of martensite, partly due to work hardening of the ferrite matrix caused by increasing contents of martensite, and partly due to larger solid solution strengthening of carbon dissolved in the ferrite or possibly larger precipitation strengthening of fine carbides. The post-uniform elongation occurring between the onset of diffuse and sharp necking was found to increase with the strain rate sensitivity of the flow stress, M. (10 refs.)

103178 Diffusion of Al-Cu alloy castings in homogenization. N.Murakami, T.Owadano, T.Kobayashi (Kyushu Inst. of Technol., Fukuoka, Japan).
Bull. Kyushu Inst. Technol. (Sci. & Technol.) (Japan), no.46, p.11-17 (March 1983). In Japanese.
The authors investigated the dependency of Cu concentration on the diffusion coefficient in homogenization of Al-Cu alloy. Diffusion couples were composed of $CuAl_2$ phase alloy and solid solution of Al-Cu (0 to 4 wt.%) alloys. Diffusion coefficients were calculated by two methods, the phase boundary migration method and Matano method. The results obtained are as follows: the diffusion coefficient of Cu calculated by the phase boundary migration method decreased slightly as the Cu concentration of the solid solution increased; the diffusion coefficient of Cu calculated by the Matano method decreased very slightly as the copper concentration increased; the values of the diffusion coefficients calculated by the two methods were in good agreement when the accuracy of the results were considered. The averaged values of the diffusion coefficients were: $D = 11.3 \times 10^{-10}$ cm^2/sec at 530°C, $D = 7.0 \times 10^{-10}$ cm^2/sec at 520°C, D-4.6×10^{-10} cm^2/sec at 510°C. (9 refs.)

103179 On the accelerated ageing of CFRP. T.A.Collings, S.M.Copley (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).
Composites (GB), vol.14, no.3, p.180-8 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
A technique is presented for the accelerated ageing of CFRP. The essential feature is a three-stage conditioning by which moisture distribution can be controlled to produce a through-thickness moisture profile that is representative of naturally aged specimens. Results are given for a range of thicknesses. Concurrent with the experimental work, a mathematical model of the diffusion process was developed and used. Correlation between experiment and theory is shown to be good. (7 refs.)

103180 Annealing behaviour of gamma-ray-induced electron traps in LEC *n*-InP. J.Koyama, J.Shirafuji, Y.Inuishi (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
Electron. Lett. (GB), vol.19, no.16, p.609-11 (4 Aug. 1983).
The annealing behaviour of a gamma-ray-induced dominant electron trap ($E_c - 0.79$ eV) in LEC undoped *n*-InP is studied by means of the DLTS technique. The isothermal annealing experiment shows it is a first-order process with an activation energy of 0.98 eV; this value is much smaller than those found in room-temperature-irradiated *n*-GaAs. (5 refs.)

103181 Radiation induced thermomechanical shock experiments of structural materials for cryogenic applications. H.Yanagi, K.Someya, K.Miya (Nuclear Engng. Res. Lab., Ibaraki, Japan).
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.661-75 (Sept. 1982).
Composite materials are often used as structural materials under the pulsed magnetic fields of superconducting magnets. Since their electrical conductivi-

ties are not very small, an eddy current could be induced into them. If the eddy current is induced, it causes thermomechanical vibration and dynamic stress in those materials. A quick quench of the superconducting magnets might be another source of the thermomechanical shock to the composite materials because of transient thermal stress. To investigate the thermal shock effect on them, experiments were conducted irradiating electron-linac pulsed beams as a heat source to a sample of graphite fibre-epoxy composites. The rapid rise of temperature and corresponding thermal strains were measured as function of time. Thermal stress analysis was made by solving an equation of heat conduction and then an equation of thermal load balance based on the finite element method (FEM). The numerical analysis based on FEM agrees well with experimental data. (no refs.)

103182 Laser heat treatment: the state of the art. J.Mazumder (Univ. of Illinois, Urbana, IL, USA).
J. Met. (USA), vol.35, no.5, p.18-26 (May 1983). In German.
Highly localized, high heating and cooling rates inherent in laser processing are found to be beneficial to improve hardness, wear, and fatigue properties of many steels and cast irons. Development of reliable high-power CO_2 lasers in the past decade has made this process industrially viable, and many industries have already adopted the technique. Present research in this area involves optimization of the process, evaluation of wear and fatigue properties, and development of a transport phenomena model to predict the hardened zone profile. The state of the art of this process is reviewed. (24 refs.)

103183 Mathematical modelling of the inductional tempering of steel samples. A.N.Tikhonov, V.B.Glasko, N.I.Kulik, M.K.Trubetskov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1370-4 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.955-60 (Dec. 1982).
Complete mathematical modelling of inductional tempering processes in various inductors is performed on a computer. Using regularizing algorithms, the problem of heat control and the problem of purposive control are solved. (10 refs.)

103184 Strain aging of Ti-6242 at hot-working temperatures. P.Dadras, J.F.Thomas,Jr. (Materials Sci. & Engng., Wright State Univ., Dayton, OH, USA), J.C.Moosbrugger.
Metall. Trans. A (USA), vol.14A, no.7, p.1512-16 (July 1983).
It has been shown that the development of yield drops in $(\alpha+\beta)$ Ti-6242 during upset compression at hot working temperatures follows static strain aging kinetics. Since irreversible strengthening is not observed and boundary sliding is expected to be important, the aging response is interpreted in terms of atmosphere formation around boundary dislocations. (no refs.)

103185 Physical aging in polystyrene: comparison of the changes in creep behavior with the enthalpy relaxation. Ryong-Joon Roe (Dept. of Materials Sci. & Metallurgical Engng., Univ. of Cincinnati, Cincinnati, OH, USA), G.M.Millman.
Polym. Eng. & Sci. (USA), vol.23, no.6, p.318-22 (April 1983).
Physical aging in polystyrene was studied by annealing samples isothermally (at 22°, 57°, and 93°C) for various lengths of time and measuring the changes in the enthalpy and the flexural creep property. The enthalpy decrease reached a constant value after about 10 hours of aging at 93°C, indicating an apparent attainment of equilibrium, whereas the creep behaviour continued to change with prolonged aging even after 10 hours. At room temperature it took about a year of aging to induce a measurable change in enthalpy, while the creep behaviour showed changes clearly only after hours of aging. These and other items of evidence indicate that the effect of aging on the creep behaviour of evidence cannot be interpreted solely in terms of the free volume concept. Thus the hope of being able to predict the mechanical properties of aged polymers from the measurement of specific volume or enthalpy alone is not likely to be realized. (15 refs.)

103186 Annealing of ultra-oriented high density polyethylene extrudates. A.Tsuruta, T.Kanamoto, K.Tanaka (Dept. of Chem., Sci. Univ. of Tokyo, Tokyo, Japan).
Polym. Eng. & Sci. (USA), vol.23, no.9, p.521-9 (June 1983).
The annealing characteristics of highly-oriented, high density polyethylene (HDPE) fibers extruded at 90°C to constant extrusion draw ratios (EDR) of 5.8 to 30 have been studied using small-(SAXS) and wide-angle (WAXD) X-ray diffraction, differential scanning calorimetry (DSC), thermal shrinkage and tensile tests. The thermal stability in macroscopic properties, such as transparency, sample dimension, and tensile modulus, remarkably increases with the sample EDR. However, the folded chain crystals within microfibrils sensitively reorganize on annealing at $\geq 110°C$, even when the macroscopic properties exhibit not significant changes at high EDRs. Although the EDR has a minor effect on the reorganizability of the fold chain crystals, it has a major influence on the SAXS intensity and the extended chain crystalline component detected by WAXD for both unannealed and annealed extrudates. This specific crystalline component has an improved thermal stability and enhances the thermal stability of macroscopic properties at higher EDR. (36 refs.)

103187 A peculiar austenite stabilization phenomenon in an ausaged Fe-Ni-Ti alloy. T.Tadaki, K.Asayama, T.Kakeshita, K.Shimizu (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
Scr. Metall. (USA), vol.17, no.7, p.893-5 (July 1983).
The martensitic transformations in Fe-Ni based alloys with the addition of Ti or Al have been reported to be suppressed by appropriate austenite ageings. That is, the austenites of these alloys can be stabilized by ausageing. Besides the stabilization phenomenon of austenite, the authors are interested in how γ' precipitates formed in the ausaged Fe-Ni-Ti or -Al alloys are responsible for the changes in the crystallography of martensitic transformations, and thus have begun a study on those points. In the course of the study, a peculiar phenomenon has been found as to the austenite stabilization. This peculiar phenomenon is briefly reported. (5 refs.)

103188 Information about SRO-kinetics from isochronal annealing of electrical resistivity. D.Trattner, W.Pfeiler (Inst. fur Festkorperphys., Univ. Wein, Vienna, Austria).
Scr. Metall. (USA), vol.17, no.7, p.909-13 (July 1983).
Whereas isothermal annealing after an adequate temperature treatment has already proved to be an advantageous tool in studying SRO-kinetics, information also arises from isochronal annealing, if the various isochronal steps are carefully analysed. The authors report on experiments of isochronal annealing of α-brass and the excellent correspondence with calculations based on the Schulze-Lucke formalism, assuming that two thermal activated processes with different relaxation times simultaneously are involved in SRO-kinetics. (4 refs.)

103189 Effect of thermomagnetic processing on magnetic properties of iron and iron-silicon alloys. V.I.Efimov, M.K.Savchenko, V.I.Sen'kin, S.Kh.Yanson (Krasnoyarsk Polytech. Inst., Krasnoyarsk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1011-14 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.41-6 (Nov. 1982).
Results of experimental studies of the effect of cooling iron and iron-silicon alloys in a magnetic field on their magnetic properties are presented. It is shown that the magnetic properies are improved and are dependent on the prehistory of the materials and the temperature from which cooling in the field is commenced. Thermomagnetic processing creates a state within the material in which there is no stabilization of ferromagnetic domain boundaries and the contribution of irreversible shifting processes to magnetization is reduced significantly. 81.40J Elasticity and anelasticity

(see also 62.20D Elastic constants, 62.40 Anelasticity, internal friction, and mechanical resonances)

103190 Youngs modulus and linear expansion coefficient anomalies in 18Cr8Ni and 18Cr25Ni alloys at low temperatures. I.N.Klimenko, V.Ya.Ilichev (Physico Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, USSR).
Cryogenics (GB), vol.23, no.9, p.492-4 (Sept. 1983).
18Cr8Ni and 18Cr25Ni alloys have been studied using γ-resonance spectroscopy. At $T<100K$ an increase in the isomeric shift to more negative values was found in 18Cr8Ni. As the region of the isomeric shift change coincides with the invar-anomaly temperature observed in this alloy, the isomeric shift behaviour was associated with an increase in electron density on the iron cores, which takes place at the $\gamma_1 \rightleftharpoons \gamma_2$ transition in γ-iron electron configurations. Differences in the isomeric shift behaviour of 18Cr8Ni and 18Cr25Ni alloys seems to be associated with the amount of the unstable γ_1 configuration, which at low temperatures transforms to γ_2; this is also confirmed by the drop in the value of the elastic modulus which occurs in these alloys over the same temperature range. (13 refs.)

103191 Temperature dependence of mechanical and thermal expansion properties of T300/5208 graphite/epoxy. M.W.Hyer, C.T.Herakovich, S.M.Milkovich, J.S.Short,Jr. (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Composites (GB), vol.14, no.3, p.276-80 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The elastic constants, ultimate strengths and thermal expansion behaviour of T300/5208 graphite/epoxy laminates of differing lay-ups have been determined in the temperature range 116 to 394K. Most of the properties exhibit nearly linear temperature dependences. However, the transverse modulus and the axial thermal expansion vary non-linearly with temperature, their values changing by an order of magnitude over the temperature range considered. (6 refs.)

103192 About one variational principle in the stress analysis of an elastic solid under irradiation taking into account the geometrical nonlinearity. A.N.Alizade, R.Yu.Amenzade.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.48-56 (1982). In Russian.
A variational theorem for the stress analysis of an anisotropic elastic solid under irradiation taking into account the geometrical nonlinearity is suggested. In the proof the dependence of the mechanical characteristics of the material and the value of volumetric expansion on the time, co-ordinates and parameters, determined by physics of phenomena, is assumed. As an example a hinged spindle's irradiation has been considered. (4 refs.)

103193 Physical characterization and molecular structure of hydrophilic polymers obtained by radiation cast-polymerization of methoxypolyethyleneglycol methacrylate monomers for biomedical applications. M.Kumakura, I.Kaetsu (Takasaki Radiation Chem. Res. Establ., Japan Atomic Energy Res. Inst., Gunma, Japan).
J. Mater. Sci. (GB), vol.18, no.8, p.2430-6 (Aug. 1983).
Hydrophilic polymers were prepared by radiation cast-polymerization of methoxypolyethyleneglycol methacrylate monomers for biomedical applications, and the relationship between physical characterization and molecular structure was studied. As the number, n, of oxyethylene units, $-(OCH_2CH_2)_n-$, in the monomers increased, the hydration ability of the polymers increased markedly until $n=4$ and after that increased moderately. The mechanical properties, such as tensile and tear strength decreased, and the elongation at break increased to a maximum and then decreased with increasing n. This appeared to be a characteristic of the polymers of methoxypolyethyleneglycol methacrylate monomers. The mechanical properties of the copolymers resulting from the copolymerization of methoxypolyethyleneglycol methacrylate with hydroxyhexyl methacrylate monomer were also studied. (13 refs.)

103194 Mechanical properties of ceramics. I. Elastic properties of ceramics. N.Soga.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.353, p.229-36 (Feb. 1983). In Japanese.
Discusses elastic properties of ceramics, which are important factors in studying thermal stress and shock produced under high temperature environment. There are static and dynamic methods for measuring elastic constants of ceramics. A resonance method has become feasible in conjunction with a large-scale computer. While finding the Young's modulus of ceramics may be cumbersome theoretically, the Young's modulus E can be expressed by $E=3K(1-2\nu)$ as a function of the bulk modulus K and Poisson's ratio ν is 0.2 to 0.3. The modulus of elasticity at high temperatures become important in evaluating strength and shock resistance at high temperatures. The Debye temperature θ_D can be calculated from the sound velocity using the equation $\theta_D=(h/k)(3pN/4\pi M)^{1/3}(2/3\nu_e{}^3+1/3\nu_2{}^3)^{1/3}$ where h is Plank's constant, k is the Boltzmann constant, N is the Avogadro number, M is the average atomic weight and ρ is the density.

103195 The effect of Mo^{5+} ions (in the presence of Mo^{6+} ions) on the elastic moduli of molybdenum phosphate glasses. N.D.Patel, B.Bridge (Dept. of Phys., Brunel Univ., Uxbridge, England).
Phys. & Chem. Glasses (GB), vol.25, no.5, p.130-4 (Oct. 1983).
The analysis of the valency states of molybdenum ions in molybdenum phosphate glasses has been carried out by electron spin resonance and atomic absorption spectroscopy. The data covered the entire vitreous range that can be obtained by melting MoO_3 with P_2O_5 and ammonium molybdate with orthophosphoric acid in open crucibles. In both series of glasses, maximum total Mo content, the ratio of Mo^{5+} to Mo^{6+} ions, and the volume per gramme atom of oxygen, occurred at about 53 mol.% MoO_3, corresponding to a structural rearrangement of metaphosphate and pyrophosphate groupings. The elastic moduli of all the glasses increased systematically with increasing Mo^{5+} content, whilst the Poisson ratio decreased. These observations are interpreted on the argument that the crosslink density of the glasses increases when Mo^{5+} ions replace Mo^{6+} ions, and therefore with Mo^{5+} content. (8 refs.)

103196 Isochrone based mastercurves of viscoelastic functions. H.A.Schneider, H.-J.Cantow (Inst. fur Makromolekulare Chem., Univ. Freiburg, Freiburg, Germany).
Polym. Bull. (Germany), vol.9, no.8-9, p.361-8 (March 1983).
Composite curves of the viscoelastic functions may be obtained not only by the usual shift of isotherm data along the frequency axis, but also by a shift of the respective isochrones along the reciprocal temperature axis. This shift along the $1/T$ axis is equivalent to that of the isochrones of dynamic viscosity, along the slope of zero shear apparent activation energy of flow. It is demonstrated that both types of shift are related to this zero shear activation energy of flow, so that an unique shift mechanism is effective in both cases. Isochrone based mastercurves are favourable for studies on polymer blends particularly, because the problematical choice of the reference temperatures of the components is circumvented. (5 refs.)

103197 Temperature dependence of the dynamic viscoelastic response of amorphous poly(diethylene glycol terephthalate) chains. E.Riande, J.Guzman (Inst. de Plasticos y Caucho, CSIC, Madrid, Spain), M.A.Llorente.
Polym. Bull. (Germany), vol.9, no.8-9, p.369-74 (March 1983).
Experimental values of the storage $G'(\omega)$ and loss $G''(\omega)$ moduli were obtained at different temperatures for several fractions of poly(diethylene glycol terephthalate). By assuming that all the relaxation mechanisms have the same temperature dependence, free volume parameters were obtained. The qualitative analysis of the molecular weight dependence of the viscosity at zero shear rate suggests that well developed entanglements are present in the relatively low molecular weight fractions investigated. (11 refs.)

103198 Polyisobutylene model elastomers prepared using demonstrably complete end-linking reactions. I. Elongation moduli of the trifunctional and tetrafunctional networks prepared from the linear polymers. P.-H.Sung, S.-J.Pan, J.E.Mark (Dept. of Chem., Univ. of Cincinnati, Cincinnati, OH, USA), V.S.C.Chang, J.E.Lackey, J.P.Kennedy.
Polym. Bull. (Germany), vol.9, no.8-9, p.375-81 (March 1983).
Linear polyisobutylene (PIB) molecules with either hydroxyl or isopropenyl groups at the chain ends were prepared using cationic polymerizations with bifunctional initiator-chain transfer agents. Extensive spectroscopic analyses confirmed the essentially perfect difunctionality of the two types of polymers. The former polymers were end-linked using an aromatic triisocyanate, and the latter by means of a tetrafunctional silane. The resulting trifunctional and tetrafunctional model PIB networks were found to have absolutely negligible sol fractions, which demonstrates that the end-linking reactions used to prepare them were essentially complete. The networks were studied with regard to their equilibrium stress-strain isotherms in uniaxial extension at 25°C. (25 refs.)

103199 Temperature dependent uniaxial stress relaxation in polyamide 6. T.Sterzynski, M.Szostak, A.Nowak (Inst. of Machine Building Technol., Tech. Univ. of Poznan, Poznan, Poland).
Polym. Bull. (Germany), vol.9, no.8-9, p.410-16 (March 1983).
Stress relaxation phenomena in polyamide 6 are presented. Tests were carried out on the tensile testing machine Fu 10000 e, using oar-shaped samples. Dependence of uniaxial stress changes in time, temperature or initial load was observed and measured. Analytical and mechanical models of stress relaxation in polyamide 6 were developed and are presented. (4 refs.)

103200 Dynamic mechanical and thermomechanical properties of silicone-polycarbonate block copolymers. W.Maung, K.M.Chua, T.H.Ng, H.L.Williams (Dept. of Chem. Engng. & Appl. Chem., Univ. of Toronto, Toronto, Ontario, Canada).
Polym. Eng. & Sci. (USA), vol.23, no.8, p.439-45 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
Representative random, alternating block copolymers of polydimethylsiloxane (PDMS) and bisphenol-A-polycarbonate (BPAPC) were studied by thermomechanical and dynamic mechanical techniques. Data on glass transition temperatures (T_g), heat-deflection temperatures (T_d), Vicat softening temperatures (T_s), coefficients of linear expansion (α), stress-strain, and stress relaxation for four PDMS-BPAPC block copolymers are presented. The effect of casting films from mixed n-hexane-methylene chloride solution on the thermomechanical and dynamic mechanical properties are also studied. (18 refs.)

103201 Relationship between polymerization conditions and rheological properties for styrene-acrylonitrile copolymers. A.Garcia-Rejon, C.Rangel-Nafaile (Inst. de Investigaciones en Materiales, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), L.Rios, F.Cid.
Polym. Eng. & Sci. (USA), vol.23, no.8, p.452-8 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
Styrene-acrylonitrile (SAN) copolymers are widely used in industrial applications in the fields of appliances, automotives, housewares, medicine, and packaging. They possess most of the features of polystyrene, with improved resistance to chemical attack, stress cracking, and heat deflection, and with greater strength and toughness. Their properties depend on several factors, the most important being the composition of the feed (monomer ratio), the type and quantity of the initiator, and the solvent to monomer ratio in the feed. The authors present the results of a continuing program that studies the effect of the above-mentioned polymerization variables on the viscoelastic properties, and the way in which these variables can be adjusted in order to obtain a SAN copolymer with specific properties. (10 refs.)

103202 Measurement of the microscopic volume strain element in amorphous alloys. A.L.Taub (General Electric Corp. Res. & Dev., Schenectady, NY, USA).
Scr. Metall. (USA), vol.17, no.7, p.873-8 (July 1983).
Tensile stress relaxation tests are conducted on melt spun $Fe_{76}B_{18}Si_6$ ribbons at 498K. The equivalent shear stress and strain rates are computed from the curves. The small values of the volume strain element are difficult to reconcile with presently formulated dislocation models of deformation but the data are in accord with the free volume models for flow. (24 refs.)

103203 Rules of the change in Young's modulus of glass and carbon-reinforced plastics in relation to temperature. N.V.Skvortsova (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.6, p.844-8 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.110-14 (June 1982).
An investigation was made of the change in Young's modulus of carbon- and glass-reinforced plastics in the 20-800°C temperature range with a heating rate of 10 deg/min in argon. An expression is adopted as the basis for approximating the temperature relationship of Young's modulus of reinforced plastics. (2 refs.)

103204 Elastic properties of nongradient glasses and glasses synthesized by ion-exchange diffusion above and below the glass-transition temperature. V.Ya.Livshits, D.G.Tennison, G.O.Karapetyan (Leningrad Technol. Inst. of the Cellulose & Paper Industry, Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.285-90 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.422-8 (July-Aug. 1982). [received: May 1983]
With the equimolar replacement of Li_2O by Na_2O, the propagation velocity of longitudinal and transverse ultrasonic waves regularly diminishes. The dependence of the molar energy of the chemical bond U on composition has an extremal character; the maximum value of U corresponds to minimum ionicity of the chemical bonds in a glass. Thus, the mixed-alkali effect appears in the migration of energy (phonons of ultrasonic waves) and is caused by the energetics and the character of the chemical bond in the glass. The elastic properties of gradient glasses formed by high-temperature and low-temperature ion-exchange synthesis differ one from the other. The theoretical strength of a glass after ion-exchange increases (or decreases) with an increase (or decrease) in the energy of the chemical interactions in a gradient glass modified by interdiffusion. (15 refs.)

103205 Elastic moduli, hardness and thermal expansion of CaO-P_2O_5 and MgO-P_2O_5 glasses. M.Ashizuka, T.Sakai (Kyushu Inst. of Technol., Kitakyushu-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.176-82 (1983). In Japanese.
Density, elastic moduli, Vickers hardness and thermal expansion coefficient for CaO-P_2O_5 (47.5∼55.0 mol.% CaO) and MgO-P_2O_5 (47.5∼57.5 mol.% MgO) glasses have been studied. Mean molar volumes calculated from mean molecular weight and density were compared with ideal mixed molar volumes estimated from the molar volumes of the constituent oxides in the phosphate glasses. The relationship between these two kinds of molar volumes for CaO-P_2O_5 glasses was a linear over the entire range of composition, whereas the relationship for MgO-P_2O_5 glasses was not linear with maximum deviation at the metaphosphate composition relative to the linear line for CaO-P_2O_5 glasses. The deviation decreased with a decrease in MgO content and the curve agreed with the linear line for CaO-P_2O_5 glasses about 33 mol.% MgO. There were definite relationships between elastic moduli (bulk modulus K, Young's modulus E, shear modulus G and Poisson's ratio ν) and mean atomic volume. (11 refs.)

103206 The elastic properties of the glasses in the systems R_2O-B_2O_3-SiO_2 (R=Na and K) and Na_2O-B_2O_3. K.Takahashi, A.Osaka, R.Furuno (Dept. of Industrial Chem., School of Engng., Okayama Univ., Okayama-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.199-205 (1983). In Japanese.
The elastic properties of the glasses in the systems $xR_2O.B_2O_3.rSiO_2$ ($0<x<1.3$; $r=1$ and 2; R=Na and K) and $yNa_2O.(1-y)B_2O_3$ have been measured by the pulse transmission method. The elastic constants of the glasses in the sodium borate systems with and without 5 mol.% MgO exhibited a maximum at the molar ratio $(MgO+Na_2O)/B_2O_3=0.5$. This composition is equivalent to that at which the fraction N_4 of the four-coordinated boron atoms in those glasses deviates from the relation $N_4=(MgO+Na_2O)/B_2O_3$. Therefore the elastic constant is expected to play a role indicating the composition with the maximum value of N_4 and the formation of non-bridging oxygens. The results in the alkali borate glasses have been applied to the borosilicate glasses in order to estimate the composition at which the N_4 becomes maximum and also to ascertain if the potassium oxide plays the same role as the sodium oxide. The log-log plot of the bulk modulus versus the mean atom-pair volume verifies the previous model of the borosilicate glasses. The effect of SiO_2 content on the elastic properties of the borosilicate glasses has also been discussed. (19 refs.)

103207 Temperature- and strain-rate dependence of the flow stress of ultrapure niobium single crystals in cyclic deformation. F.Ackermann, H.Mughrabi, A.Seeger (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Acta Metall. (USA), vol.31, no.9, p.1353-66 (Sept. 1983).
After cyclic deformation into saturation at room temperature, the temperature dependence of the cyclic flow stress of ultrapure niobium single crystals was measured in the range 160-500K at three different plastic shear-strain rates varying from $\approx 10^{-4}\ s^{-1}$ to $\approx 10^{-2}\ s^{-1}$. The experimental data may be fitted very satisfactorily to theoretical relationships which describe the flow stress of pure BCC metals in the temperature/stress regime in which the strain rate is controlled by the formation of kink pairs on screw dislocations. The theory provides analytical expressions which are valid in well-defined ranges of stress and temperature. The evaluation of the data in the high- and low-stress regimes yields mutually consistent values for the formation enthalpy of two isolated kinks which is found to be $2H_k=0.65\pm0.02$ eV. From the low-stress data the diffusion coefficient of kinks is determined as $D_k=1.4\times10^{-6}\ m^2\ s^{-1}$ over the approximate temperature range 250-350K. The product of the density of (mobile) screw dislocations and the spacing between obstacles which are insurmountable by kinks is found to be $\approx 7\times10^4\ m^{-1}$. (50 refs.)

103208 Flow stress of low carbon steels in the ($\gamma\rightarrow\alpha$)-transformation region. R.Kaspar, A.Streisselberger, O.Pawelski.
Arch. Eisenhuettenwes. (Germany), vol.54, no.5, p.195-8 (May 1983). In German.
A plain carbon steel and a Ti-bearing HSLA steel were investigated with respect to the flow stress vs. deformation temperature relationship within the ($\gamma\rightarrow\alpha$)-transformation region. A computer-controlled hot deformation simulator (WUMSI) was employed for the experiments. In addition to the evaluated flow stress curves quantitative metallography was applied. (20 refs.)

103209 The influence of prestrains on the buckling behaviour of a normalized plain carbon steel (German grade Ck45). B.Scholtes, O.Vohringer, E.Macherauch.
Arch. Eisenhuettenwes. (Germany), vol.54, no.5, p.199-202 (May 1983). In German.
The influence of prestrain on the buckling behaviour has been investigated on normalized specimens of the German steel grade Ck45. Buckling specimens have been taken from tensile test bars subjected to different amounts of prestrain and the relevant compressive force-contraction diagrams determined. The investigations revealed that the maximum buckling stress decreases with increasing plastic strain and reaches at $\epsilon_p\approx2\%$ less than half the value of an unstrained specimen. This behaviour is attributable to the change caused by the Bauschinger effect of the deformation characteristic of the prestrained vs. the unstrained steel. Prestrained steels do not exhibit in the tensile test an exclusively elastic strain range. For this reason, the tangent modulus taken from the compressive stress-upsetting curve is always inferior to the elasticity modulus of an unstrained specimen. A comparison between experimental and theoretical buckling stresses in consideration of the true behaviour of prestrained specimens quantitatively confirms this influence of the Bauschinger effect. (17 refs.)

103210 History effects in polycrystalline BCC metals and steel subjected to rapid changes in strain rate and temperature. J.Klepaczko (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland), J.Duffy.
Arch. Mech. (Poland), vol.34, no.4, p.419-36 (1982).
A review is presented of the available experimental data on strain rate and temperature history effects for polycrystalline BCC metals and ferritic steels together with new experimental results on AISI 1020 hot rolled steel (HRS). The early experiments on steels and other BCC metals are discussed in which interrupted tests were performed at two substantially different strain rates or temperatures. These experiments revealed that a substantial difference in response exists between BCC and FCC polycrystalline metals. The review also includes results of incremental strain rate tests with large jumps in strain rate augmented by a series of experiments designed to determine strain rate history effects in steel. A literature survey on incremental tests for BCC metals and steel is also included. Experimental results for ferritic steels indicate that for low temperatures as well as for the dynamic ageing temperature region strain rate history effects are of considerable importance. (46 refs.)

103211 Necking and drawing in polymeric fibers under tension. B.D.Coleman (Dept. of Maths., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Arch. Ration. Mech. & Anal. (Germany), vol.83, no.2, p.115-37 (1983).
A constitutive relation is proposed for the dependence of the tension in a thin polymeric fiber on the variation of the stretch ratio λ along the fiber axis. When this relation is placed in the equation of balance of forces, it yields a nonlinear second-order differential equation for λ whose equilibrium solutions (for a long fiber) are known in other contexts. The solutions describe necks, bulges, drawing configurations, and periodic striations. The assumption that motions resulting from gradual changes in tension or length are homotopies formed from these equilibrium solutions is compatible with many of the observed properties of tension-induced necking and drawing in fibers of such polymers as nylon and polyethylene. (16 refs.)

103212 On the very heterogeneous behaviour of plastic deformation during rolling of ferrite-martensite dual phase steels and on the mechanism of microcrack formation and their propagation through the material. A.Berghezan, Xi Jing He (Univ. Catholique de Louvain-la-Neuve, Louvain-la-Neuve, Belgium).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1169-74 (25 April 1983). In French.
The purpose of this work was to find out the main causes of the premature failure of certain dual ferritic-martensitic steels. In order to reveal the principal factors responsible for this shortcoming, certain of the dual steels were deformed deliberately by cold-rolling and not by traction. It was necessary during the deformation of the sheet to examine continuously a clean and virgin surface and not a dirty one which has been leveled down by the rollers of the mill. An 'artefact' was used and instead of the examination of the rolling plane surface, the side surfaces were examined, which were—before rolling—polished and slightly etched to reveal both phases. In this way, it was found that the deformation of these two-phase steels is excessively heterogeneous. This heterogeneity is entirely or principally due to the hard martensite crystals which act as very efficent obstacles to impede the flow of the ductile ferrite. However, the main interest was to detect the mechanisms of the microcrack formation and their propagation through the material. (5 refs.)

103213 Water absorption of glass/epoxy laminates under bending stresses. K.A.Kasturiarachchi, G.Pritchard (School of Chem. & Phys. Sci., Kingston Polytech., Kingston-upon-Thames, England).
Composites (GB), vol.14, no.3, p.244-50 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The water absorption characteristics of unidirectional glass/epoxy laminates have been studied during hygrothermal ageing at 95% relative humidity and temperatures up to 80°C for periods of up to 900 days. Initial water absorption behaviour approximately followed Fick's Laws, but deviations occurred at higher temperatures (~80°C). No classical equilibrium absorption plateau was obtained at any temperature and irregular changes in specimen weight were observed after prolonged exposure at 80°C. These changes are explained in part by postulating a degradation process, involving interaction between water and the curing agent. Four-point bending stresses were applied to some specimens during hygrothermal exposure. These stresses were insufficient to have much effect on the diffusivity, but surface damage was induced between the two loading noses on the compressive face. Failure occurred after prolonged exposure to high stresses at 45°C. Pre-stressing does not affect water uptake, but post-loading already soaked laminates lowers the flexural modulus. (16 refs.)

103214 Structure of localized flow regions observed on strong deformation of Fe-Ni alloys in martensitic state. V.I.Izotov, A.P.Kozlov (Inst. of Metallography & Phys. of Metals, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1211-13 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An investigation was made of the structure of Fe-23% Ni-3% Mn and Fe-32% Ni alloys subjected to a series of heat and mechanical treatments. Studies carried out in the martensite state indicated that plastic flow created inhomogeneous (localized flow) regions in parts of a crystal occupied by many martensite crystallites of this kind. (2 refs.) *A.T.*

103215 Short glass fiber-natural rubber composites. V.M.Murty (Rubber Technol. Centre, Indian Inst. of Technol., Kharagpur, India).
Int. J. Polym. Mater. (GB), vol.10, no.2, p.149-58 (1983).
Effect of fiber concentration on the physical properties such as tensile strength tear strength and elongation at break, flexing resistance, heat buildup, compression set, permanent set, hardness, resilience and aging resistance of natural rubber filled with treated short glass fiber has been studied. The effect of carbon black on the physical properties and processing characteristics of the fiber-rubber composites has also been studied at different fiber concentrations. Scanning electron microscopy studies have been made in order to assess the failure criteria. (10 refs.)

103216 Strain distribution in the superplastic Pb-Sn eutectic alloy. M.M.I.Ahmed, T.G.Langdon (Dept. of Materials Sci., Univ. of Southern California, Los Angeles, CA, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2407-13 (Aug. 1983).
Experiments were conducted to investigate the distribution of strain within the gauge length for specimens of the superplastic Pb-62 wt.% Sn eutectic alloy tested at room temperature. It is shown that deformation is quasi-uniform at low strain rates in region II so that the necks are diffuse rather than localized, but failure occurs by the formation of a sharp neck at high strain rates in region III. Using a specimen grain size of 6.1 μm, the transition from region II to region III occurs at an initial strain rate in the vicinity of 10^{-4} sec^{-1}. (15 refs.)

103217 The effect of grain size on deformation twinning in a textured zinc alloy. N.Ecob, B.Ralph (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2419-29 (Aug. 1983).
The incidence of deformation twinning in samples of a commercial rolled zinc-0.1% aluminium-0.05 wt.% magnesium alloy has been measured at room temperature as a function of strain, grain size and direction of loading relative to the rolling direction. The volume fraction of twinned material has been measured at the surface and in the bulk. It is shown that this volume fraction is a linear function of both strain and grain size in most cases. Bands of heavily twinned grains are found to form inhomogeneously across the gauge length of tensile specimens, by an autocatalytic mechanism. Several examples are given of the interaction of twins and slip bands at grain boundaries which illustrate the formation and the accommodation of twins. The smaller volume fraction of twins found at the surface compared with the bulk reflects a relaxation of Von Mises criterion. (16 refs.)

103218 Superplastic flow and failure at 773K in the aluminium-calcium eutectic alloy. G.Piatti (Materials Sci. Div., Ispra Establ.-Joint Res. Centre, Comm. of the European Communities, Ispra, Italy).
J. Mater. Sci. (GB), vol.18, no.8, p.2471-83 (Aug. 1983).
The superplastic behaviour of the hot rolled Al-Ca eutectic alloy (7.6 wt.% Ca) was investigated at a temperature, $T=773$K, with strain rates varying from 2×10^{-5} to 4×10^{-1} sec^{-1} and for a grain size of the order of 3 μm. The results showed that the stress strain rate behaviour could be divided into two distinct portions: (a) region II at intermediate and low strain rates ($\dot{\epsilon}\leq4\times10^{-2}$ sec^{-1}) where the strain rate sensitivity index, m, was ≥0.30 (superplastic regime); (b) region III at higher strain rates ($\dot{\epsilon}>4\times10^{-2}$ sec^{-1}) where m was <0.30 (conventional deformation regime). Elongations at fracture of greater than 300% were achieved on the region II of superplasticity (maximum value about 570%). There was experimental evidence in superplastic flow conditions of a grain boundary sliding process and dislocation activity within the aluminium matrix grains. The fracture depended on a void linkage mechanism which included on a microscopic scale the internal necking of the tiny ligaments already formed between the cavities. (30 refs.)

103219 Effects of SME cycle on the mechanical properties of the TiNi alloys. Y.Sekiguchi (Dept. of Precision Machinery Engng., Univ. of Tokyo, Tokyo, Japan), Y.Watanabe, K.Funami, H.Funakubo, Y.Suzuki.
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.777-86 (Sept. 1982).
A wire material is obtained from TiNi shape memory alloy, and then the heat treatment temperature is changed. After that, measurement of electric resistance, hardness and tensile strength were taken. As a result of that, it is found that the best shape memory function is retained under the heat treatment conditions at 500°C. It is also explained that an efficient shape memory effect has been acquired by providing approximately 30 times of SME (shape memory effects) cycle with prestrain of 6% from the SME cycle test results, when the heat-treated wire material is used as a functional element under the above conditions. (11 refs.)

103220 Effect of small additions of titanium and boron on the electrical and mechanical properties of an electroconductor aluminum alloy. M.S.Devgun, T.Perez, O.Nino (Dept. of Mech., Univ. Simon Bolivar, Caracus, Venezuela).
J. Met. (USA), vol.35, no.5, p.55-8 (May 1983).
The effects of small additions of titanium and boron on the electrical resistivity and mechanical properties of an electroconductor aluminum alloy have been reported. The amount of titanium was varied within a range from 0.001 to 0.005% and boron from 0.002 to 0.042%. It was concluded in the case of both elements that, for any fixed percent of one element, the increasing additions of the second element produces a linear increase in both the electrical resistance and the ultimate strength of the resultant alloy but decreased its ductility linearly. Also, larger additions of these elements produces finer grain material. (7 refs.)

103221 Relation between Bauschinger effect and work-hardening in copper single crystals. T.Yakou, T.Hasegawa (Dept. of Mech. Engng., Tokyo Univ. of Agriculture & Technol., Tokyo, Japan), M.Shimizu, S.Karashima.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.555-60 (July 1983). In Japanese.
In order to get information on the dislocation mechanism of the Bauschinger effect, the Bauschinger strain, $\gamma_B(n)$, during compression after tensile prestraining was measured at room temperature in copper in a reversed-stress range of $0\leq n\leq1(n=|\tau/\tau_p|;\tau$: the reversed stress at which $\gamma_B(n)$ was measured, τ_p: the stress in prestraining at which the stress direction was reversed). The behaviour of increase of $\gamma_B(n)$ for $n\leq\sim0.5$ (at an early stage of reversed straining) with the progress of work-hardening during prestraining was found to be different from that for $n>\sim0.5$ (at a later stage of reversed straining), that is, the increase was linear over the deformation stages in prestraining I, II and III for $n\leq\sim0.5$, but it was rapid, slow and again rapid in stages I, II and III, respectively, for $n>\sim0.5$. In spite of this behaviour, however, an amount of $\gamma_B(n)$ in a fixed value of n was given as a unique function of an amount of work-hardening, not depending on the specimen orientation. The fact implies that the Bauschinger effect is mainly controlled by the work-hardening phenomena during prestraining. The behaviour of increase of $\gamma_B(n)$ with the progress of work-hardening was explained from dislocation structures formed during prestraining. (20 refs.)

103222 Nonlinear stress-strain response of plain woven glass cloth reinforced laminates. S.Amijima (Faculty of Engng., Doshisha Univ., Kyoto, Japan), T.Adachi.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.498-502 (May 1983). In Japanese.
Presents a method of predicting the nonlinear stress-strain curves up to the tensile failure for plain woven glass fiber cloth reinforced polyester laminates, when the load direction does not coincide with the fiber direction. The application of the laminate plate theory to the small stress increments of the stress-strain curve was done in the proposed analytical procedure. Comparisons were made between the analytical prediction and the experimental results for plain woven and nonwoven glass fiber reinforced laminates. As the results, the calculated stress-strain curves were found to be in considerably good agreement with the experimental results and the nonwoven laminate had higher strength and rigidity than the plain woven laminate for those with low fiber orientation angles, but had lower strength and rigidity for those with high fiber orientation angles. (10 refs.)

103223 The cyclic stress-strain response of polycrystalline Al-Zn-Mg alloy and commercial alloys based on this system. A.Renard, A.S.Cheng, R.de la Veaux, C.Laird (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.113-20 (Aug. 1983).
An investigation of cyclic reponse has been made on pure Al-Zn-Mg ternary alloy, heat treated by two methods so as to produce shearable and non-shearable precipitates, and two commercial alloys based on this system. A particular feature of the investigation was the measurement of cyclic stress-strain curves at very low strains not hitherto reported for aluminum-based commercial alloys. Plateaux have not been observed in the cyclic stress-strain curves of any of these alloys. The Al-Zn-Mg alloy was found to be cyclically stable for both heat treatments and the constituent and dispersoid particles in the commercial alloys acted to homogenize the strain distribution. Moreover, the small grain size of all the alloys also helped to suppress any evidence of strain localization in the cyclic stress-strain curves. Life measurements for these alloys are also reported. (24 refs.)

103224 Microstructural mechanism for the anomalous tensile behaviour of aluminum-killed steel prestrained in plane strain tension. B.V.N.Rao (Analytica Chem. Dept., General Motors Res. Labs., Warren, MI, USA), J.V.Laukonis.
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.125-35 (Aug. 1983).
Aluminum-killed steel subjected to a tensile deformation following a prestrain in plane strain tension exhibits increases in yield strength, an earlier onset of strain localization and less work hardening than it would exhibit had it been subjected to an equivalent uniaxial prestrain. The effects are generally larger if the tensile axis is orthogonal to the prestrain axis. To understand the substructural origin of such anomalous behaviour, transmission electron microscopy of the steel was performed after each step of processing. It has been found that, when the tensile axis is orthogonal to the prestrain axis, the dislocation cell structure of the prestrain becomes unstable and 'dissolves', whereas it is stable and reinforced if the tensile axis is parallel to the prestrain axis. These differences in substructure and the concepts of the cell wall 'polarization' and 'memory' have been used to account for the anomalous tensile behaviour of the prestrained material. (11 refs.)

103225 Control of the steady creep in Ag-2.7 wt.% Al by dissolution-enhanced diffusion. M.R.Nagy, G.H.Deaf, R.Kamel (Phys. Dept., Ain Shams Univ., Cairo, Egypt).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.173-6 (Aug. 1983).
The temperature dependence of the steady state creep rate of Ag-2.7 wt.% Al was determined by measuring the creep rate for a period of 2 min at a series of temperatures, 10°C apart. The temperature range covered was 180-280°C to include the dissolution temperature (about 250°C) of the μ phase. In the range 180-250°C the material showed creep resistance due to an ordered μ phase in the form of a precipitate. Above 250°C the creep resistance was affected by the dissolution of the precipitates. An activation energy for the creep rate above 250°C was found to be 6.5 ± 1 kcal mol^{-1}, much lower than the activation energy for self-diffusion (42 ± 1 kcal mol^{-1}). (9 refs.)

103226 Cyclic softening and thermally activated deformation of titanium and zirconium. J.I.Dickson, L.Handfield, G.L'Esperance (Dept. de Genie Metall., Ecole Polytech., Montreal, Quebec, Canada).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.L3-7 (Aug. 1983).
Cyclic softening in commercial purity zirconium and titanium corresponds principally to a decrease in effective stress and to an increase in screw dislocation mobility. This result indicates that the thermally activated deformation of these metals is not controlled by the overcoming of individual interstitial solute atoms by dislocations as usually proposed. (32 refs.)

103227 Some surprising features of the plastic deformation of body-centered cubic metals and alloys. J.W.Christian.
Metall. Trans. A (USA), vol.14A, no.7, p.1237-56 (July 1983).
The metals which have the BCC structure at and below room temperature include iron, the refractory metals of groups VA and VIA, and the alkali metals. Extensive experimental and theoretical investigations of the deformation behavior of these metals and their alloys which have been carried out at Oxford and elsewhere in the last twenty years are reviewed. Attention is

concentrated mainly on the low temperature properties where many surprising or anomalous features have been discovered. The phenomena discussed include slip asymmetry, the failure of the Schmid law of critical resolved shear stress, the observation of 'anomalous slip' in very pure metals and alloys, solution softening, and the ductile-brittle transition. (110 refs.)

103228 Deformation behavior of a 16-8-2 GTA weld as influenced by its solidification substructure. J.R.Foulds (Dept. of Materials Sci., Univ. of Cincinnati, Cincinnati, OH, USA), J.Moteff, V.K.Sikka, J.W.McEnerney.
Metall. Trans. A (USA), vol.14A, no.7, p.1357-66 (July 1983).
Weldment sections from 'formed and welded' type 316 stainless steel pipe are characterized with respect to some time-independent (tensile) and time-dependent (creep) mechanical properties at temperatures between 25°C and 649°C. The GTA weldment, welded with 16-8-2 filler metal, is sectioned from pipe in the 'formed+welded+solution annealed+straightened' condition, as well as in the same condition with an additional 're-solution' treatment. Detailed room temperature microhardness measurements on these sections before and after reannealing enable a determination of the different recovery characteristics of weld and base metal. The observed stable weld metal solidification dislocation substructure in comparison with the base metal 'random' dislocation structure, in fact, adequately explains weld/base metal elevated temperature mechanical behavior differences from this recovery characteristic standpoint. The weld metal substructure is the only parameter common to the variety of austenitic stainless steel welds exhibiting the consistent parent/weld metal deformation behavior differences described. (27 refs.)

103229 The effect of prior heat treatments on the structure and properties of warm-rolled AISI 52100 steel. T.R.McNelley (United States Naval Postgraduate School, Monterey, CA, USA), M.R.Edwards, A.Doig, D.H.Boone, C.W.Schultz.
Metall. Trans. A (USA), vol.14A, no.7, p.1427-33 (July 1983).
Isothermal rolling of AISI 52100 steel at 923K (650°C) has been used to produce very fine spheroidized carbide particles 0.1 to 0.2 μm in size in a submicron grain size ferrite matrix. Pearlitic starting structures are not completely spheroidized by such warm rolling and some isolated pearlite colonies remain after rolling. Tempered martensitic starting structures result in more uniform structures after rolling. The effect of varying the austenitizing time and temperature and of two cycle austenitizing treatments before rolling of tempered martensite were studied. After rolling, the room temperature yield strength was raised, a result of the finer dispersion of carbides and the associated reduction in ferrite grain size. The presence of isolated pearlite colonies in rolled material reduces the room temperature ductility. (16 refs.)

103230 Cyclic creep and stress rupture of a mechanically alloyed oxide dispersion and precipitation strengthened nickel-base superalloy. V.C.Nardone, D.Matejczyk, J.K.Tien (Henry Krumb School of Mines, Columbia Univ., New York, NY, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1435-41 (July 1983).
Cyclic creep and stress rupture results of Inconel MA 6000E are reported and discussed as a function of frequency. Inconel MA 6000E is a new alloy system developed for high creep resistance at intermediate as well as at high temperatures. It is a mechanically alloyed oxide dispersion ($\sim$2.5 vol pct) and γ' precipitation ($\sim$50 vol pct) strengthened nickel-base superalloy. A decrease in the minimum strain rate and increase in the rupture life were found to accompany cyclic frequency increase. The deceleration of the creep rate is related to the anelastic strains recovered during the off-load periods. The data are also discussed relative to those obtained for an alloy containing only the oxide dispersoids. (16 refs.)

103231 The effect of titanium on creep strength in 2.25 pct Cr-1 pct Mo steels. J.Pilling, N.Ridley, D.J.Gooch (Joint Univ. of Manchester/UMIST Dept. of Metall., Manchester, England).
Metall. Trans. A (USA), vol.14A, no.7, p.1443-9 (July 1983).
The effect of a low level of titanium on the microstructure and creep properties of 2.25 pct Cr-1 pct Mo steels has been examined as a function of carbon content and austenitizing temperature. The addition of 0.04 wt pct titanium resulted in a dramatic increase in creep strength at 565°C, and this was found to be associated with the presence in the microstructure of very small (50 to 100 Å) titanium-bearing precipitates based upon both TiC and Mo_2C. The variation of the minimum creep rate with carbon content and austenitizing treatment was explained in terms of the solubility of TiC in austenite. The titanium-bearing carbides have an important effect on microstructural stability and on the maintenance of creep strength, but it is also apparent that solid solution strengthening by molybdenum can make a significant contribution to creep strength at low carbon levels (0.02 wt pct). (16 refs.)

103232 Observations of grain boundary sliding during superplastic deformation. G.Rai (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA), N.J.Grant.
Metall. Trans. A (USA), vol.14A, no.7, p.1451-8 (July 1983).
Flat test specimens of a 10-micron grain size Al-33 pct Cu alloy were deformed in air over a range of strains at 450°C (723 K) and at 10^{-5} strain per second, and examined by SEM. Direct observations and measurements were also made in a SEM during superplastic deformation of a 5-micron Pb-Sn eutectic alloy at room temperature at a strain rate of about 10^{-5} s^{-1}. Extensive grain boundary sliding was noted. Microcreep curves were obtained between initially adjacent grains and showed that deformation is cyclical in nature and varies by several orders of magnitude locally from point to point. Many surface grains are observed to change neighbors many times, to undergo some rotation and tilt, to show little change in size or shape, and yet to avoid intergranular cracking. Superplastic deformation is a highly heterogeneous process, not unlike that observed in the creep of conventional types of alloys at elevated temperatures, but differing in the extent of plastic deformation free of intergranular cracking, combined with extensive recovery in the form of boundary migration. (27 refs.)

103233 Plastic behavior of aluminum-killed steel following plane-strain deformation. R.H.Wagoner (General Motors Res. Labs., Warren, MI, USA), J.V.Laukonis.
Metall. Trans. A (USA), vol.14A, no.7, p.1487-95 (July 1983).
Aluminium-killed steel sheets have been subjected to plane-strain prestrain in three ways: two-pass rolling, multi-pass rolling, and inplane, plane-strain tension. Subsequent uniaxial tensile tests were performed to evaluate the residual work-hardening behavior. The subsequent hardening curves depended primarily on the relative direction between major strain axes in the two deformation stages and very little on the specific prestrain procedure. These curves showed high initial yield stresses followed by a region of low (or negative) work hardening rate. This behavior contrasted with earlier results for 70/30 brass sheet, and a model of subsequent tensile behavior based on a strain-induced stress transient emerged. (36 refs.)

103234 Role of retained austenite of the deformation of an Fe-0.07 C-1.8 Mn-1.4 Si dual-phase steel. Joon Jeong Yi (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea), Ki Joon Yu, In Sup Kim, Sang Joo Kim.
Metall. Trans. A (USA), vol.14A, no.7, p.1497-504 (July 1983).
The influence of retained austenite on the work hardening behavior of dual-phase steel has been investigated with an Fe-0.07 C-1.8 Mn-1.4 Si steel. With a constant cooling rate of 5°C per second after intercritical annealing at 780°C, a significant quantity (about 8 vol. pct) of retained austenite was obtained in the dual-phase microstructure. The retained austenite was classified morphologically into either 'isolated' or 'capsulated' types by TEM observation. The 'capsulated' type, which was found without a particular shape inside the microtwinned martensite particle, withstood much deformation without a particular shape inside the microtwinned martensite particle, withstood much deformation of being protected by the surround martensite. While the 'isolated' type, which was found with an equiaxed shape and was isolated from martensite particles, was easily deformed by the first several percent plastic strain. The increase in work hardening rate, caused by the strain induced transformation of retained austenite to martensite, was ascribed to the contribution of the 'isolated' type, the major volume fraction of retained austenite. (22 refs.)

103235 On the strain dependence of plastic-strain ratio of deep-drawing sheet steels. Hsun Hu (Basic Res. Div., United States Res. Lab., Monroeville, PA, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1521-3 (July 1983).
The plastic strain ratios, r values of aluminium killed temper rolled steel sheets are presented. Results on the strain dependence of the r values are compared with those of Arthey and Hutchinson (see ibid., vol.12, p.1817-22, 1981). (7 refs.)

103236 Role of internal stress for continuous yielding of dual-phase steels. T.Sakaki, K.Sugimoto, T.Fukuzato (Dept. of Mech. Engng., Tokyo Metropolitan Univ., Tokyo, Japan).
Mem. Fac. Technol. Tokyo Metrop. Univ. (Japan), no.32, p.3093-102 (1982).
In a dual-phase steel, the distributions of the plastic strain and the internal stress arising from the martensite transformation were calculated based on the continuum mechanics. It was found that there are preferentially yielding zones around each martensite island, and initial yielding begins in these zones under very low applied stress because the internal stress assists the initial yielding. There are a number of preferentially yielding zones in the dual-phase steel, thus the Luders band is masked. (8 refs.)

103237 Superplastic forming of alumina. C.Carry, A.Mocellin.
Proc. Br. Ceram. Soc. (GB), no.33, p.101-15 (May 1983). (Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3', London, England, 13-14 Dec. 1982).
The experimental conditions are evaluated under which plastic deformation of alumina polycrystals could be considered superplastic from both macroscopic and microscopic points of view. Fine grained Al_2O_3 samples were produced by hot pressing at 1500°C. Parallelepiped specimens were deformed in compression in the same temperature range under constant stress (25 to 30MPa). Strain rates varied from 5.10^{-4}/s down and strains up to 0.30 were obtained. Strain rate exponents, m 1 $(\delta \log \sigma)/(\delta \text{ Log } \dot{\epsilon})$, were measured at various stages during testing. Subsequently half shells were hot formed in the same temperature range from alumina discs five centimeter diameter and two millimeter thick. The macroscopic behaviour and the microstructural evolution during the deformation of such alumina materials are presented and discussed. In particular, it is suggested that superplastic micromechanisms have been predominant. (23 refs.)

103238 Physical ageing in rigid chain polymers. G.Levita (Dept. of Chem. Engineering, Univ. of Pisa, Pisa, Italy), L.C.E.Struik.
Polymer (GB), vol.24, no.8, p.1071-4 (Aug. 1983).
Torsional and tensile creep properties of a cellulose acetate butyrate ester and the polyimide Kapton-H were studied in order to reveal physical ageing in these rigid chain polymers. The measured shift rates, μ, were 0.75 and 0.5 for cellulose and polyimide respectively, which indicates that physical ageing also occurs in polymers with stiff chains. These values, compared with those already known for most thermoplastics ($\mu \sim 1$), suggest that physical ageing is slowed down by the rigidity of the main chain. (5 refs.)

103239 Characterization of elastomeric network structures using the effects of swelling on stress-strain isotherms and the extents of swelling at thermodynamic equilibrium. J.P.Queslel, J.E.Mark (Dept. of Chem., Univ. of Cincinnati, Cincinnati, OH, USA).
Polym. Bull. (Germany), vol.10, no.3-4, p.119-25 (July 1983).
Swelling has long been used in the study of elastomeric networks. In the case of stress-strain measurements on swollen networks, the most important observation was the decrease of the Mooney constant $2C_2$, which is widely used to represent the magnitude of the departure of an observed stress-strain isotherm from that predicted by the simplest molecular theories. Swelling equilibrium data were generally analysed by the Flory-Rehner equation for affine networks simply to obtain a measure of the degree of cross-linking. The advent of model networks whose structures are well known and of a new theory due to Flory constitute great improvements for the study of rubberlike elasticity. In this new context, swelling can be used to obtain additional important molecular information through both uniaxial extension of swollen samples and swelling equilibrium. In particular, the relation between the main parameter κ characterizing the local constraints on junction fluctuations in the Flory theory, the extent of swelling, and the molecular weight between cross-links can be probed. (16 refs.)

103240 Some mechanical properties of rigid polyurethane structural form. J.M.Lifshitz (Faculty of Mech. Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.144-54 (Feb. 1983). [received: July 1983]
The mechanical response of integral-skin rigid polyurethane foam, with an average density of 300 to 700 kg/m^3, to constant rate and creep loading was determined. Sandwich specimens were modeled by layers of a core material and two skins, whose secent moduli had been determined experimentally by separate tests and approximated by linear functions of the density. The effective rigidities of the sandwich in tension and flexure were calculated and compared favorably to experimental measurements. The sandwich structure improved the flexural rigidity of homogeneous foam by a factor of more than 2.20. Tensile creep tests of sandwich specimens at relatively low stress levels (up to about 38 percent of their strength) showed that the creep was nonlinear, but a single creep curve could represent creep of specimens of various densities, provided the relative load on them was the same. A limited number of flexural creep tests led to similar conclusions, but the creep rate was smaller than in tension. (18 refs.)

103241 Analysis of the puncture of a bisphenol-A polycarbonate disc. R.P.Nimmer (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.155-64 (Feb. 1983). [received: July 1983]
The finite element technique is applied to analytically predict the response of a disc made of BPA-polycarbonate during a displacement-controlled puncture test with a hemispherical indenter. The analysis includes effects of contact load, large displacements and rotations, and large strains and material yielding. Two general topics are addressed with this analysis. First, it is shown that the load-displacement behavior of impacted, BPA-polycarbonate plates can be accurately predicted over a wide range of engineering interest (strains up to 30 percent) using a bilinear representation of the stress-strain curve and flow theory of plasticity. For this purpose, the von Mises criterion is applied to define yielding in a generalized biaxial stress state, and strain rate effects are incorporated through the use of a yield stress consistent with the initial strain rate during the test. Second, in order to broaden the understanding of results associated with this widely used test, a number of mechanial and material effects are discussed, including large displacements, friction at the clamped support and indenter head, and clamping pressure at the support. (26 refs.)

103242 Effect of the addition of EPM copolymers on the properties of high density polyethylene/isotactic polypropylene blends. II. Morphology and mechanical properties of extruded samples. L.d'Orazio, R.Greco, E.Martuscelli, G.Ragosta (Istituto di Ricerche su Tecnologia dei Polimeri e Reologia, CNR, Naples, Italy).
Polym. Eng. & Sci. (USA), vol.23, no.9, p.489-97 (June 1983).
For pt.I see ibid., vol.22, p.536 (1982). The influence of the addition of two ethylene-propylene random copolymers (EPM) with different composition on the mechanical properties, thermal behavior and overall morphology of high density polyethylene (HDPE)/isotactic polypropylene (iPP) blends, was investigated on extruded samples. The experimental data showed that the morphology of binary HDPE/iPP blends is drastically modified by these additives and that the ultimate mechanical properties of these mixtures are greatly improved. A reasonable explanation of these results can be ascribed to the fact that these copolymers can act as 'compatibilizing agents' in the amorphous regions of the two semicrystalline homopolymers. The extent of such effects is dependent on the chemical structure and/or on the molecular mass of the added copolymer as well as on the HDPE/iPP blend compositions. (14 refs.)

103243 Microsnonuniform deformation of steel containing non-metallic inclusions. G.I.Bel'chenko, S.I.Gubenko.
Russ. Metall. (GB), no.4, p.82-6 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.94-7 (1981). [received: June 1983]
Depending on structure, non-metallic inclusions have a higher or lower plasticity than the steel matrix. Close to the non-deforming inclusions of corundum, spinel and titanium nitrides and oxides an increased deformation develops in the matrix at all the temperatures investigated. Plastic inclusions of sulphides and silicates control the deformation of the ferritic and austenitic matrix of low carbon steel, which, due to its good plastic properties, adapts to the inclusion and deforms with it, to the same degree. Microdeformations around rigid inclusions and cavities are distributed non-uniformly relative to the tensile axis, whilst the microdeformations around the plastic inclusions are distributed more uniformly. The strength of the interface boundary inclusion-matrix can be higher or lower than the intermolecular strength of the inclusion, and this determines the nature of the microfractures occurring close to the non-metallic inclusions during the deformation of steel. (5 refs.)

103244 Effect of structural transformations in the cast conditions on the high-temperature ductility of nickel alloys. K.K.Burnakov.
Russ. Metall. (GB), no.4, p.102-6 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.112-16 (1981). [received: June 1983]
If nickel alloy ingots are deformed under industrial conditions a stable dislocation structure and substructure forms which is not removed by intermediate heating. This leads to accumulation of internal stresses which are not relaxed during working and give rise to fracture of the ingots during further deformation. The fracture is also brought about by other factors, namely, lath-shaped inclusions, eutectic, impurities, etc. Cooling the ingots in air after preliminary partial deformation gives rise to the evolution of carbide intermetallic phases in the structure. During subsequent heating recrystallisation nuclei form around these inclusions which grow intensively when the metal is held under these temperatures. After such treatment a structure will form which consists of coarse grains in the previous axial zones and fine grains in the interaxial zones. (4 refs.)

103245 A note on different ways to calculate the activation enthalpy of serrated flow from stress drops. E.Pink (Erich-Schmid-Inst. fur Festkorperphys. der Osterreichischen, Akad. der Wissenschaften, Leoben, Austria).
Scr. Metall. (USA), vol.17, no.7, p.847-52 (July 1983).
The equal suitability has been ascertained of methods which start from easily measurable characteristics of serrations. Empirical relations have been found which correlate the values of Δt with the strain rates. The assumption that the results from such stress drop methods are equal to those which are derived with the conventional method using the critical onset strain, is verified for A-type, but not for C-type serrations. But there are again indications that dynamic strain aging does not follow in every aspect the stationary aging law as formulated by Cottrell and Bilby. (10 refs.)

103246 Deformation properties of high purity α-Fe single crystals. M.Feller-Kniepmeier, M.Hundt (Inst. fur Metallforschung, Tech. Univ. Berlin, Berlin, Germany).
Scr. Metall. (USA), vol.17, no.7, p.905-8 (July 1983).
The strong temperature dependence of the critical shear stress of BCC metals at low temperatures is mainly accounted for by the decreasing mobility of screw dislocations. These processes are superposed by interactions with foreign atoms especially with interstitials. In order to obtain a closer view of the intrinsic deformation properties of α-Fe, tensile and compression tests were done with high purity single crystals. (15 refs.)

103247 Calculating the thermal and stress-strain state of complex shaped steel articles during hardening. V.S.Morganyuk (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.6, p.807-13 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.80-5 (June 1982).
As a result of solving the thermal conductivity and thermoplasticity problems for the cooling process, a complete picture was obtained for changes in the temperature field, structure and stress strain state during specimen hardening. Curves for calculated residual stresses are compared with experimental data. Agreement of calculated and experimental results is satisfactory. (7 refs.)

103248 Analysis of the strength of copper over wide ranges of temperature and strain rate. V.A.Borisenko, B.D.Kosov, V.P.Krashchenko, V.E.Statsenko, S.V.Guchalov (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.6, p.833-8 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.101-6 (June 1982).
A general equation was formulated by Borisenko et al. (1982) based on certain preconditions of a physical and empirical nature connecting material ultimate strength σ with thermodynamic parameters, i.e. temperature T and activation energy spectrum (enthalpy) of the plastic deformation process U, and also strain rate $\dot{\epsilon}$. The present authors' aim is to give experimental proof of the equation from test results for copper over a wide range of temperature and strain rates. (3 refs.)

103249 Mechanical properties of composite microwires (copper-glass). I.A.Annanurova, M.V.Zakharova, D.F.Miglei, A.A.Predvoditelev (Moscow State Univ., Moscow, USSR).
Strength Mater. (USA), vol.14, no.6, p.849-52 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.114-17 (June 1982).
Detailed investigations were made of the mechanical properties of microwires in a glass shell. The results of the X-ray diffraction investigations showed that in general the metal strands are polycrystalline but individual grains may cover the whole cross section of the microwire. It was also established that the structure of the metal strand grains corresponds to the cast condition. The analysis of the strain curve indicates that the deformation of the copper strands is accompanied by marked plastic flow. (9 refs.)

103250 Influence of ultrasonic action on the bending deformation of D16 and V95 alloy plates. G.Ya.Bazelyuk, A.M.Lyubchik, S.Ya.Matsievskaya, G.A.Petrunin, L.V.Tikhonov (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.6, p.853-7 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.117-21 (June 1982).
Ultrasonic action on plates of D16 and V95 aluminum alloys subjected to a small degree of bending deformation increases the degree of residual deformation. The latter increases with an increase in the time and intensity of the ultrasonic action. The dislocation structure of D16 alloy plates deformed under ultrasonic action differs in the presence of a high density of helical dislocations and dislocation loops, which is an indication of the increased vacancy concentration and also of intense creep over of screw and mixed dislocations during ultrasonic action. Apparently, the processes of creep over of dislocations serve as the basic reason for the increase in residual deformation in deformation in an ultrasonic field. The investigations made make it possible to recommend the method of combined static and acoustic loading for shaping small thin sheet aluminum alloy parts. (4 refs.)

103251 Nonuniformity of distribution of residual microstrains during cyclic deformation. E.A.Belugina, S.I.Popov, N.A.Khudyakova (All-Union Sci.-Res. Inst. Railroad Transportation, USSR).
Strength Mater. (USA), vol.14, no.7, p.895-8 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.34-6 (July 1982).
Microstrain distribution is significantly less uniform under cyclic loading than under static loading and depends on the degree of nonuniformity of the microstructure. A region of compressive strain is formed at the tip of fatigue cracks propagating in austenitic steel G13L. The function representing the dependence of the microstrain correlation coefficient on distance is periodic in nature, with a period roughly equal to two grain sizes for the steel. (4 refs.)

103252 Changes in the structure and mechanical properties of 25Kh2MFA steel under the effect of programmed increasing load and irradiation. I.A.Gindin, V.M.Netesov, L.A.Chirkina, V.S.Okovit, I.F.Borisov, V.K.Aksenov (Physicotech. Inst., Kharkov, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.898-902 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.36-40 (July 1982).
25Kh2MFA steel in the initial condition is characterized by a finely disperse cellular structure and by the presence of carbide precipitates. The maximum size of the mobile dislocation segment is 5×10^{-7} m. Programmed loading at 473K results in the formation of a structure characterized by the presence of a short-loop spectrum of the dislocations ($L_s=2.5\times10^{-7}$ m) with weak pinning by the point defects. Such a structure has, firstly, a higher resistance to plastic deformation than the initial condition and, secondly, the process of plastic deformation takes place more uniformly in the entire volume of the material. The irradiation of 25Kh2MFA steel with high-energy electrons (225 MeV) with a flux of 7×10^{20} electrons/m^2 increases, because of the formation of a large number of deformation centers in the vicinity of the dislocations, the probability of formation of double kinks thus causing plasticizing of the steel. (12 refs.)

103253 Effect of stress-state invariants on the geometry of strength theories of structural materials. II. V.A.Man'kovskii (Sevastopol' Higher Naval Engng. School., Sevastopol', USSR).
Strength Mater. (USA), vol.14, no.7, p.915-20 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.51-6 (July 1982).
For pt.I see Probl. Prochn., vol.14, no.6, p.49-53, 1982, or Strength Mater., vol.14, no.6, p.769-72, 1982. Macrostatistical normalised stress analysis leads to an important conclusion in principle. The effect of the cubic invariant $I_3(D_\sigma)$ of the normalized-stress deviator on the strength geometry of structural materials can be neglected. Moreover, a similar approach makes it possible to interpret the most prevalent strength criteria in terms of mathematical statistics, to produce the dispersion strength condition, which applies to virtually all known tests (including tests with orthotropic materials) and which results in a majority of prevalent strength theories with certain rather rigid assumptions. (19 refs.)

103254 Effect of the ferrite grain size on the deformation and fracture characteristics of a structural steel. L.I.Gladshtein, N.P.Larionova (Central Sci. Res. & Design Inst. of Engng. Metal Structures, Moscow, USSR).
Strength Mater. (USA), vol.14, no.7, p.936-44 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.68-75 (July 1982).
Refining of the ferrite grains increases the plastic deformation resistance in all the stages of deformation and, in a number of cases, also improves the ductility and energy capacity of the structural steel in a wide range of temperature and loading rate. The cold strength increases simultaneously; this is associated with an increase in the microcleavage stress in the intial and deformed conditions. These changes are particularly marked at grain sizes smaller than 25-30 µm. In the range of the variation of the factors examined in the experiments, the effect of the structure and loading conditions of cold strength was analyzed with the aid of the force criterion of brittle fracture formulated on the basis of the investigations carried out by Ioffe, Davidenkov, Fridman, and Uzhik. It is shown that this procedure can be used to calculate the brittleness transition temperature in various loading conditions. (14 refs.)

103255 Anisotropy of the physicomechanical characteristics of asbestos, glass, and carbon textolites in the 293-873K temperature range. E.A.Eskin, V.K.Fedchuk, V.V.Vengzhen (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.984-9 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.109-13 (July 1982).
The investigated materials possess significant anisotropy of mechanical properties in tension and bending and insignificant in compression. With an increase in temperature the parameters of anisotropy increase, especially in carbon and carbon-metal plastics. The relationships of tensile strength and modulus of elasticity of the studied materials to the angle of the test α have the form of steadily dropping curves which with an increase in temperature do not change substantially. (5 refs.)

103256 Comparison between high temperature dead-load creep and stress-relaxation deformation in iron-doped polycrystalline aluminum and magnesium oxides. Y.Ikuma, D.K.Shetty, R.S.Gordon (Dept. of Materials Sci. & Engng., Univ. of Utah, Salt Lake City, UT, USA).
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.251-7 (1983).
The high temperature deformation of iron-doped polycrystalline aluminum and magnesium oxides was studied by stress relaxation and dead-load creep. Linear and non-linear anelastic effects, which are important in stress relaxation, can lead to significant differences in apparent creep rates and strain rate-stress relationships which are inferred from dead-load creep and stress relaxation data. In the low stress regime, the effects of the major variables, such as temperature and grain size, are similar for both modes of deformation and are consistent with diffusional creep controlled by various combinations of lattice and grain boundary diffusion. In the non-viscous deformation of magnesium oxide, dead-load creep and stress relaxation testing yielded similar results in terms of the grain size effect and activation energy for deformation. However, in the case of iron-doped aluminum oxide, the stress relaxation is apparently athermal and strongly influenced by non-linear anelasticity. (22 refs.)

103257 Some aspects of thermoplasticity. T.Lehmann (Ruhr Univ., Bochum, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.4, p.T3-13 (1983). In German.
Describes the rate-independent non-isothermal form changes in metals assuming the classical continuum, and considering the elements of the solids as thermodynamic systems. The analysis is carried out on the basis of a model by applying tensor calculations for the reversible elastic strains and for the plastic irreversible phenomena. The study indicates the complexity of the problem with unresolved points in the process. (18 refs.) *I.G.*

(inc. hardness; see also 62.20M Fatigue, brittleness, fracture and cracks)

103258 Sliding mode crack closure and mode III fatigue crack growth in mild steel. E.K.Tschegg (Inst. of Appl. & Tech. Phys., Tech. Univ. Vienna, Vienna, Austria).
Acta Metall. (USA), vol.31, no.9, p.1323-30 (Sept. 1983).
Mode III fatigue crack growth behaviour in AISI C10108 steel ($R=-1$, 1Hz) is investigated in circumferentially notched cylindrical specimens. The crack surfaces in contact glide against each other, the friction, abrasion and mutual support between them reducing the effective stress at the crack tip ('sliding mode crack closure'). Crack growth rates under the effective stressing (so-called 'true' crack growth rates) can be obtained by extrapolation to

zero crack length ($c \rightarrow 0$), when no friction can be present. This way the effect of sliding mode crack closure can be quantified. It increases with increased plastic strain intensity reaches a maximum for $\Delta\Gamma_{III} \sim 1.5 \times 10^{-2}$ mm for the tested specimens and decreases drastically for stressing beyond that value. For these large loadings the large plastic zones formed in mode III open the crack in mode I and eliminate friction. Fractographic evidence for the processes involved is obtained. (16 refs.)

103259 Comparison of transition temperatures from instrumented impact tests with the Robertson crack-arrest-temperature. K.E.Hagedorn (Max-Planck-Inst. fur Eisenforschung, Dusseldorf, Germany).
Arch. Eisenhuettenwes. (Germany), vol.54, no.6, p.239-44 (June 1983).
Presents a definition of a transition temperature in instrumented impact tests characterizing the crack arrest behaviour of steels as the highest temperature up to which the steep drop of the impact load extends down to zero. The comparison of this temperature and the crack arrest temperature of isothermal Robertson tests yielded a good linear correlation. (18 refs.)

103260 Influence of the notch radius on the collapse and initiation limiting temperature of weldable structural steels. H.Krafka, K.Wobst, D.Aurich (Bundesanstalt fur Materialprufung, Berlin, Germany).
Arch. Eisenhuettenwes. (Germany), vol.54, no.6, p.245-52 (June 1983).
Investigates the collapse limiting temperature T_{gy}, initiation limiting temperature T_i the influence of the notch radius for various specimen sizes, material-mechanical correlations, the influence of the plastic stress concentration factor, the cleavage fracture strength and the yield point on T_{gy}. Also gives an estimation of the influence of notch radius and specimen size on the plastic stress concentration factor with the aid of the slip line theory and the stress according to the HRR field and discusses the significance of the results for the safety analysis and T_i as limiting temperature for the application of the elastoplastic fracture mechanics in terms of initiation and growth of stable cracks. (24 refs.)

103261 Crack growth in vitreous silica under dynamic loading. Y.Hibino, S.Sakaguchi, Y.Tajima (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.388-92 (Aug. 1983).
The authors studied the stable crack growth process in silica glass under various dynamic loading conditions. Remarkable crack growth was observed. The crack growth process in a constant environment was expressed uniquely as a crack growth rate curve against stress intensity factor, independent of the loading method. (7 refs.)

103262 Load bearing capacity of TiN coated WC-Co cemented carbides. M.T.Laugier (Hard Materials Res. Centre, Sandvik Ltd., Coventry, England).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.419-21 (Aug. 1983).
TiN coatings produced by CVD on cemented carbide substrates have been found to fail by brittle fracture under normally loaded indenters. In the case of flat indenters the critical load P_c to produce ring cracks was found to be proportional to $D^{3/2}$ when D is the crack diameter. From this result which is consistent with Auerbach's law, values for the room temperature fracture surface energy and the fracture toughness were deduced. (7 refs.)

103263 Fracture morphology of rubber compounds containing recycled rubber powder. R.P.Burford, M.Pittolo (School of Chem. Engng. & Industrial Chem., Univ. of New South Wales, Kensington, NSW, Australia).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.422-4 (Aug. 1983).
The failure process responsible for the diminution in mechanical properties of rubber compounds containing 'crumb' filler is examined. SEM micrographs of representative fracture surfaces are presented. It is shown that the failure process is associated with dewetting of the crumb particles, with ultimate failure occurring by growth of the voids formed. (13 refs.)

103264 High velocity indentation study of the brittleness of rigid PVC after ageing. G.Roux, G.Revirand (CSTB, St. Martin d'Heres, France).
Cah. Groupe Fr. Rheol. (France), vol.5, no.6, p.305-16 (Feb. 1982). In French. [received: July 1983]
The authors present a direct evaluation by mechanical testing of the mechanical durability of thin rigid PVC profiles. It is made by following a durability index: the brittle temperature, T_F, measured at a constant speed by indentation test after artificial or natural ageing. (5 refs.)

103265 The effect of moisture on the shear properties of carbon fibre composites. O.K.Joshi (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).
Composites (GB), vol.14, no.3, p.196-200 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
A study was made of the effect of moisture on the mechanical properties of composites (carbon fibre-reinforced epoxy resins) which are dominated by the matrix or matrix/fibre interface. Such properties are the interlaminar shear strength in unidirectional laminates and tensile strength in (±45) laminates. Unidirectional material was either immersed in boiling water or aged in a hot-humid atmosphere and then the interlaminar shear strength was measured at room temperature in short beam bending. The values obtained were found to be independent of the mode of exposure but depended on the amount of moisture present in the composite. The (±45) material was aged at 70°C and 95% relative humidity to accelerate the moisture uptake and then tested at 20°C, 70°C, 110°C and 130°C. At test temperatures above 70°C the tensile strength decreased as the composite absorbed moisture. Plasticization, swelling and debonding were identified as the factors affecting the failure mechanisms in these laminates.

103266 Effect of moisture on the notch sensitivity of carbon fibre composites. S.M.Bishop (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).
Composites (GB), vol.14, no.3, p.201-5 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The effect of absorbed moisture on the notched tensile strength of multidirectional carbon fibre/epoxy laminates with two different poly stacking sequences has been evaluated at room temperature. In laminates made from fibres with either the standard commercial level or lower levels of fibre surface treatment, moisture resulted in a significant decrease in notched tensile strength and toughness for one stacking sequence but no decrease in the other. Examination of the fractured specimens showed that in the first case, less delamination and shear cracking parallel to the fibres had occurred in wet specimens. It was concluded that the effect of moisture on notch sensitivity was dependent on the mechanisms controlling failure at the notch and these depended on ply stacking sequence. The effect of moisture on the failure mechanisms occurring at the notch is discussed. (6 refs.)

103267 The effects of water absorption on a polyester/chopped strand mat laminate. B.Ellis, M.S.Found (Dept. of Ceramics, Glasses & Polymers, Univ. of Sheffield, Sheffield, England).
Composites (GB), vol.14, no.3, p.237-43 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The water uptake by polyester resins and a CSM polyester laminate on immersion in liquid water, and the effects of such water uptake on laminate fatigue life and residual strength after fatigue cycling until resin cracking occurs, is described. Diffusion coefficients for water sorption into three resins were determined and also an apparent diffusion coefficient for the net weight change of the laminates. It was found that the fatigue behaviour of laminates after water immersion was complicated, whilst that of unsoaked laminates agrees with expected behaviour. There was an increase in residual strength of the soaked laminates after fatigue cycling. (20 refs.)

103268 Environmental fatigue of reinforced plastics. C.J.Jones, R.F.Dickson (School of Materials Sci., Univ. of Bath, Bath, England), T.Adam, H.Reiter, B.Harris.
Composites (GB), vol.14, no.3, p.288-93 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
Presents the results of a series of experiments on the fatigue behaviour of cross-plied (0/90) epoxy-based laminates reinforced with glass, carbon and Kevlar-49 fibres and, in particular, on the effects of environmental conditioning on this behaviour. Conditioning treatments used include drying, storage in an atmosphere of 65% relative humidity and boiling in water, prior to fatigue tests in repeated tension and in bending. The fatigue resistance of CFRP is unaffected by conditioning treatment and mode of stressing; for GRP there is no significant difference between the behaviour of the dry material and that conditioned at 65% relative humidity. On the other hand, boiling in water always weakens GRP and KFRP, although the effect is small except for the case of GRP in the 0/90 orientation tested in tension. The large reduction in this case results directly from loss of fibre strength during pre-conditioning. Complete drying of KFRP laminates is more damaging even than boiling. (5 refs.)

103269 The effects of environmental exposure on the fatigue behaviour of CFRP laminates. P.T.Curtis, B.B.Moore (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).
Composites (GB), vol.14, no.3, p.294-300 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
Tensile and compressive static and fatigue tests were carried out on two CFRP lay-ups; $[(90 \pm 30)_3]_s$ and $[0_2 + 45_2\ 90_2 - 45_2]_s$, both as-received and after exposure to a hot/wet environment for varying times. The rates of moisture absorption of fatigue damaged and undamaged coupons were compared. Static strengths were also measured at 100°C. Damage development was monitored by optical microscopy and ultrasonic C-scan. Despite the laminates having essentially resin dominated behaviour, environmental exposure had little effect on the strengths and fatigue lives compared with the as-received material. There were, however, significant differences in the damage developed during fatigue. (10 refs.)

103270 Post-impact fatigue performance of carbon fibre laminates with non-woven and mixed-woven layers. W.Cantwell (Dept. of Aeronautics, Imperial Coll. London, London, England), P.Curtis, J.Morton.
Composites (GB), vol.14, no.3, p.301-5 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
Woven and non-woven carbon fibre laminates were subjected to drop-weight impact at energies of up to seven Joules. The damaged laminates were tested to differing periods of O-tension and O-compression fatigue, and then static residual strength tests were performed. The non-woven composite showed greater losses in static strength after impact than the mixed-woven composite, particularly when tested in compression. After tensile fatigue, significant improvements in residual strength were recorded, which coincided with the observation of micro-delaminations throughout the laminate. After compressive fatigue there was little change in residual strength. (9 refs.)

103271 Effect of composition on the fracture toughness of hard metals. J.S.August, S.Kalish (Adamas Carbide Corp., Kenilworth, NJ, USA).
Int. J. Refract. & Hard Met. (GB), vol.2, no.2, p.88-92 (June 1983).
The influence of composition and grain size on the fracture toughness of hard metals based upon tungsten carbide, cobalt and titanium carbide was investigated. The correlation between fracture toughness properties and transverse rupture strength was also investigated. The method used is the short rod fracture toughness test and the investigation demonstrated that this test is an important tool for the development of new carbide grades and for gaining an understanding of the mechanisms of the effect of cubic carbide phase additions on the properties of cemented carbide. Results also showed that the fracture toughness measurement will not substitute for the necessity of an impact test of good reliability to determine the application properties of hard metals. (6 refs.)

103272 Structure and quantitative fractography of brittle fracture faces of low-carbon and low-alloy steels. V.M.Goritskii, D.P.Khromov (Central Sci.-Res. & Design Inst. of Structural Metal Materials, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1169-78 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The structure of brittle fracture faces was studied, including the size distribution of transgranular fracture facets, nucleation and direction of propagation of transgranular fractures relative to the direction of growth of macrocracks, and elongation of ferrite grains. The relationship between these properties and the structure of low-carbon and low-alloy steels was determined. It was found that the size of transgranular fracture facets of steels with a ferrite-pearlite structure was determined by the ferrite grain size. The nature of the distribution of the directions of transgranular fracture in steels depended on the composition and on conditions during thermomechanical treatment. It was concluded that in the process of brittle fracture the main crack propagated by nucleation (ahead of it) of leading microcracks and their subsequent coalescence with the macrocrack. (13 refs.) *A.T.*

103273 Influence of the cohesive strength of grain boundaries on strain and structure characteristics of fracture of dispersion-hardening copper-base alloys. N.V.Nikitina, V.N.Khodorenko, A.D.Korotaev, S.I.Bogdanova, Yu.I.Chumlyakov (V.D. Kuznetsov Siberian Physicotech. Sci.-Res. Inst., State Univ., Tomsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1194-201 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The flow curves right up to the moment of fracture, formation of the first cracks, and fracture surfaces of dispersion-hardening Cu-8% Al-2% Co-0.3% Sb and Cu-8% Al-2% Co (at.%) alloys, characterized by a cohesive strength of grain boundaries, were investigated in the temperature range 77-293K. A reduction in the cohesive strength of grain boundaries reduced greatly the

plasticity and strength of the material at low temperatures. The stresses corresponding to the onset of crack formation were determined. The methods of optical and scanning electron microscopy were used to identify the sources of cracks and their growth paths as a function of the flow stress and localization of slip. A relationship was found between the strain and structure characteristics of fracture. (10 refs.) *A.T.*

103274 Investigation of the mechanical lifetime of polymer films under the action of electrical fields and discharges. S.A.Abasov, M.A.Kurbanov, S.Sh.Bedirhanova, T.M.Veliev, S.S.Ragimov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.63-6 (1982). In Russian.
The dependence of the lifetime (τ_M) of polystyrene of the mechanical stress (σ) under the action of electrical field and discharges in air and liquid nitrogen has been investigated. It has been established that the dependence of lg τ_M on σ at the action of discharges in air has two linear parts, one of which (at $\sigma > \sigma^*$) conforms with dependence $\lg\tau_M = f(\sigma)$ in discharges absence, and anoitselfr (a *t* $\sigma < \sigma^*$) distinguishes the from it by the slope as a function of the decrease of the lifetime. In the case of action of discharges in liquid nitrogen a linear relation between lg τ_M and σ is apparent in the whole measured range of σ. (6 refs.)

103275 Fracture toughness of composite adherend adhesive joints under mixed mode I and III loading. E.J.Ripling, J.S.Santner, P.B.Crosley (Materials Res. Lab., Glenwood, IL, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2274-82 (Aug. 1983).
A tapered double cantilever beam specimen was modified in order to evaluate the fracture toughness of scarf joints. The modification was relatively simple: the bond line which is normally perpendicular to the applied load with this type of specimen was inclined to form the scarf joint. With this change, both normal and shear components of force act on the crack plane. Hence, in addition to measuring the total strain energy release rate, $\mathcal{G}_{total}$, its two components, the opening mode toughness, $\mathcal{G}_I$, and the edge shearing or tearing toughness, $\mathcal{G}_{III}$, were measured as well. In spite of the fact that the separation loads increased continuously with increasing scarf angle, or over-lap length, $\mathcal{G}_{total}$ and $\mathcal{G}_{III}$ only increased so long as the ratio of over-lap length to thickness did not exceed 1.75:1. Further increases in over-lap length decrease the toughness because of separation of fibres within the composite adherends. (9 refs.)

103276 Influence of precracking load on critical stress intensity factor of mild steel. Hsing-Shih Chen, Ji-Liang Doong (Dept. of Mech. Engng., Nat. Cheng Kung Univ., Tainan, Taiwan).
J. Mater. Sci. (GB), vol.18, no.8, p.2305-10 (Aug. 1983).
The effects of precracking load on critical stress intensity factor are studied. A plane stress model of elastic/plastic stress distribution which has strain hardening effects included is used. The effects of residual stresses and strain hardening due to fatigue load are calculated by choosing plastic zone size as fracture criterion. And experimental results are obtained to prove the reliability of theoretical calculations. The results show that the influence of fatigue load can be estimated directly by a computer program. (16 refs.)

103277 A fracture mechanics analysis of polypropylene/rubber blends. J.M.Hodgkinson, A.Savadori, J.G.Williams (Dept. of Mech. Engng., Imperial Coll. of Sci. & Technol., London, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2319-36 (Aug. 1983).
Static fracture tests have been carried out on a series of polypropylene/EPR/HDPE blends in order to compare their behaviour with that of the copolymers. From the evidence it appears that these materials are very similar to the copolymers in terms of fracture behaviour and morphology. The examination of impact fracture behaviour of the blends showed that both instrumented and energy measuring pendulum machines yield similar results when loading times are similar. However, it has been shown that short loading times may lead to high fracture energies, which cause blunting of the crack tip. This behaviour has been modelled using previously developed theory. The effects described demonstrate the care required in impact data interpretation. (21 refs.)

103278 Contribution of texture to the strengthening and fracture in hot-rolled magnesium-12.7 at.% cadmium alloy. G.Sambasiva Rao (Dept. of Metall., Regional Engng. Coll., Warangal, India), Y.V.R.K.Prasad.
J. Mater. Sci. (GB), vol.18, no.8, p.2385-92 (Aug. 1983).
The grain size dependencies of the yield and fracture stresses in hot rolled Mg-12.7 at.% Cd alloy have been measured in the temperature range 77 to 420K and are found to be in accordance with Hall-Petch type of equations. In hot rolled Mg−12.7 Cd alloy, the Hall-Petch intercept σ_{0y} is higher than that in hot rolled magnesium, while the slope k_y is comparable. The fracture is intercrystalline at 77K, mixed mode at 300K and ductile at 420K. The above flow and fracture behaviours are interpreted in terms of the complimentary effects of texture hardening and solid solution strengthening. (26 refs.)

103279 Strength and fracture of amorphous and partially crystallized selenium. A.R.Daudi, K.N.Subramanian (Dept. of Metall., Mech. & Materials Sci., Michigan State Univ., East Lansing, MI, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2393-400 (Aug. 1983).
The role of spherulitic crystallization on strength and fracture of the elemental glass-former selenium was investigated. Partially crystallized selenium samples having various sizes and volume fractions of spherulites were obtained by heat-treating amorphous selenium at 62, 82 and 100°C for different lengths of time. The flexure strength of partially crystallized selenium decreases with increasing size of spherulites. Scanning electron microscopy of fractured specimens showed that fracture nucleated in the peripheral regions of the spherulites. (22 refs.)

103280 Properties of $Na_2O.3SiO_2$ glasses impregnated with ethyl alcohol. M.Nogami, M.Tomozawa (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2453-8 (Aug. 1983).
$Na_2O.3SiO_2$ glasses impregnated with up to 8.5 wt.% ethanol were prepared under high pressure and hydrothermal conditions and their properties such as hardness, fracture toughness and density were measured. Both hardness and density increased initially with increasing ethanol content up to $1{\sim}2$ wt.% ethanol and then decreased with further increase in ethanol content, while fracture toughness decreased monotonically. This initial increase of hardness and density of ethanol-impregnated glasses is in contrast to the behaviour of glasses with high water content, which showed a steadily decreasing hardness and density with increasing water content. A structural study using IR and X-ray diffraction analyses was also made and changes in properties of glasses with increasing ethanol was related to the formation of Si-O-C bonds and the precipitation of sodium carbonate crystal. (21 refs.)

103281 The measurement of glass fibre strength in composites from studies of their fracture surfaces. A.C.Jaras, B.J.Norman (Res. & Dev. Labs., Pilkington Brothers plc, Ormskirk, England), S.C.Simmens.
J. Mater. Sci. (GB), vol.18, no.8, p.2459-65 (Aug. 1983).
Scanning electron microscopy provides a convenient technique for the study of glass fibre-reinforced composite fracture surfaces. The work describes how a detailed examination and measurement of the 'mirror zones' on the fracture surfaces of the fibres themselves can be used to evaluate the fibre strength at the time of failure of the composite. A mirror zone/fibre strength calibration for single E-glass fibres and alkali resistant (AR) glass fibres was made giving an inverse square root relationship for fibres down to 12 μm diameter and for strengths as high as 2000 MN m^{-2}. Using the calibration, fibre strengths in situ can be measured on failed composites and strength histograms compiled. The technique has primarily been used on fibre strength studies of glass reinforced cement composites and reinforced plastics. (36 refs.)

103282 The hardness of $PbO\text{-}ZnO\text{-}B_2O_3$ glasses. N.Shinkai, R.C.Bradt, G.E.Rindone (Ceramic Sci. & Engng. Program, Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2466-70 (Aug. 1983).
Glasses were prepared within the ternary $PbO\text{-}ZnO\text{-}B_2O_3$ system and their microhardnesses were measured. Maxima in the hardnesses were found at about the 60 mol.% B_2O_3 composition and were related to the glass structure. Trends of the hardnesses were explained in terms of the coordination of the boron and the effects of the PbO and ZnO on the structure as well as the void fraction within the glass. The hardnesses and the Young's elastic moduli were observed to be related and are also discussed. (19 refs.)

103283 The tearing of highly oriented linear polyethylene. J.Clements, I.M.Ward (Dept. of Phys., Univ. of Leeds, Leeds, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2484-96 (Aug. 1983).
The tearing behaviour of oriented linear polyethylene has been studied with particular emphasis on the effects of draw ratio, draw temperature and molecular weight distribution. In all cases the values of fracture surface energy were in the range 10^2 to 10^4 Jm^{-2}. The difference between the low molecular weight grades and high molecular weight grades of linear polyethylene were large. At high molecular weight the energy for crack propagation parallel to the direction of orientation fell by a factor of approximately two as the draw ratio was increased from 10 to 20. At low and medium molecular weights, increasing the draw ratio above a value of 10 had no significant effect on the fracture surface energy. Observation of the fracture surfaces showed a simple relationship between the nature of the fracture surface and the value of the fracture surface energy. (18 refs.)

103284 Fracture toughness and limiting strength of cermets. E.Ohtsuki (Dept. of Metal Processing, Tohoku Univ., Sendai, Japan), H.Fujita, T.Kito, Y.Masuda.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.568-74 (July 1983). In Japanese.
The fracture toughness K_{IC} and limiting strength of TiC-base cermets were determined by means of analysis of the effect of fracture-initiating defect-size on fracture stress. The K_{IC} value of TiC-16-44 mass%Ni alloys increases in the range of 6.0-9.5 $MPa\sqrt{m}$ with increase in nickel content. The value of K_{IC} (8.2 $MPa\sqrt{m}$) of a TiC-28 mass%Ni alloy decreases monotonically to 5.8-6.4 $MPa\sqrt{m}$ with increase in the content of the added carbides (Mo_2C, NbC, TaC, VC) up to 18.5 mol% (added carbides in carbide phase), except for WC addition. The decrease of K_{IC} by adding different carbides is due to the embrittlement of binder phase which is caused by dissolution of titanium and other elements be contained in the added carbides. By comparing the K_{IC} of TiC-Ni alloys with that of WC-Co alloys, it was found that the K_{IC} for a cermet composed of carbide and metal phases depends mainly on the elastic moduli ($E\&\nu$) of the alloy, and also on the critical strain energy release rate (G_{IC} (BP)) and volume fraction (f) of metal phase, according to the following equation. $K_{IC} = (E.G_{IC}(BP).f/(1-\nu^2))^{1/2}$. The limiting strength of TiC-Ni alloys, which is independent of the size of fracture-initiating defect, is raised from 1.98 to 2.57 GPa as the nickel content increases from 16 to 44 mass%, and is lowered slightly by addition of carbides except tungsten carbide. (26 refs.)

103285 Hydrogen embrittlement of Ni-Cu binary alloys. T.Maruno, R.Hotta (Graduate Student, Nagoya Inst. of Technol., Nagoya, Japan), R.Otsuka.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.582-9 (July 1983). In Japanese.
To clarify the correlation between the hydrogen embrittlement and the hydride (β-phase) formation in transition metals, Ni-Cu binary alloys have been investigated by means of electrolytic hydrogen charging and X-ray diffraction methods. The hydride formation was controlled by varying three factors, i.e. copper content, charging current-density and temperature. In any case of these three factors, it was found that independent of hydrogen content the hydrogen embrittlement occurred always only when the hydride was formed. It was concluded that the hydrogen embrittlement can be ascribed to the discontinuous expansion which accompanies the α-β transformation (hydride formation) caused by the change in hydrogen concentration. (20 refs.)

103286 Some problems on the practical use of a 3.5 GPa grade maraging steel. Zhong da Yin (Harbin Inst. of Technol., Harbin, China), H.Suto.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.590-6 (July 1983). In Japanese.
Some problems on the practical use of a 3.5 GPa maraging steel, that is, mechanical anisotropy, hydrogen embrittlement and the strength of welded joints were examined. The typical texture as a *BCC* metal was developed by cold rolling, but the mechanical anisotropy was not so distinct. The conventionally heat treated steel is very sensitive to hydrogen embrittlement. Electron beam welding reduced the tensile strength from 3.5 GPa to 3.0 GPa, but it is recommended as an available welding process for this steel. The structures of weld metal and heat affected zones were observed by means of transmission electron microscopy. (15 refs.)

103287 Fatigue crack propagation characteristic and fatigue fracture toughness in 780 MPa grade high strength steel weldments at low temperature. K.Sato (Faculty of Engng., Tohoku Univ., Sendai, Japan), T.Yokobori, H.Igarashi, S.Nishida, H.Masumoto.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.596-602 (July 1983). In Japanese.
Fatigue test and fracture toughness test in 780 MPa grade high strength steel weldments in the temperature range from 98K to room temperature were experimentally carried out. Both the tests were performed with a compact tension specimen by using a program-load-controlled 0.98 MN fatigue crack testing machine. It was found that the fatigue propagation rate in the base metal shows a similar value in both the weld metal and HAZ. The trend of fatigue crack propagation characteristic in weldments in the temperature range from 223K to room temperature is in good agreement with the dislocation dynamics theory of fatigue crack propagation. Fatigue fracture toughness, K_{fc} and fracture toughness, K_c in the base metal are larger than in both the weld metal and HAZ. (22 refs.)

103288 Effects of aging treatment on the mechanical properites of cold rolled high strength low alloy steel. M.R.Kim (Engng. Graduate School, Seoul Nat. Univ., Seoul, Korea), D.B.Hyun, T.H.Kim, S.C.Maeng.
J. Korean Inst. Met., vol.21, no.4, p.380-8 (April 1983). In Korean.
Hardness, tensile properties and impact toughness of 0.07C-1.4Mn=0.08Nb and 0.07C-1.4Mn-0.09V steels, which had been cold rolled by different degrees, were studied after aging treatment at 600°C for varying period of times. By increasing aging times, there appeared two peaks of hardness values or strength. Aging time, which caused the hardness peaks, were interdependent of cold rolling degree and were constant for the same steel. When compared at the same hardness level, ductility and impact toughness of the samples of secondary hardness peak were much better than that of the samples of primary hardness peak. Test results of mechanical properties are discussed in relation with the precipitation particle size and its distribution, coherency of the particles, and recrystallization. (14 refs.)

103289 A study on the tempered embrittlement of martensite-bainite duplex structure in Ni-Cr-Mo steel. Young Keun Oh (Graduate School, Nanyang Univ., Seoul, Korea), Jin Tae Song.
J. Korean Inst. Met., vol.21, no.4, p.389-400 (April 1983). In Korean.
A study has been made on tempered embrittlement of AISI 4340 steel having martensite-bainite duplex structure, as compared with that in tempered martensite, metallographically. Impact toughness was measured by Charpy impact tester, microstructure was examined by means of optical and transmission electron microscope, and fracture surface scanning electron microscope. The lower bainite was precipitated acicularly so as to partition prior austenite grain and the upper bainite was precipited massively so as to fill prior austenite grain. These shapes of bainite had an effect on the impact toughness, temper embrittlement and brittle fracture resistance of martensite-bainite duplex structure. The 300°C-tempered martensite embrittlement was greatly improved by martensite-bainite duplex structure and the ductile-brittle transition temperature of martensite-bainite duplex structure was lower than that of martensite. (22 refs.)

103290 Mechanical properties of ceramics. II. Strength and fracture of ceramics. N.Miyata, H.Jinno.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.340-6 (March 1983). In Japanese.
For pt.I see ibid., vol.32, p.229 (1983). Briefly describes factors affecting the strength and fracture of ceramics, based on a recent study of the effect of microstructure on them. The topical areas include: (1) factors affecting the strength of ceramics, (2) brittle fracture in ceramics, (3) the theoretical tensile strength of solids, (4) Griffith's fracture theory and fracture mechanics, (5) the effect of microstructure on fracture, (6) the effect of porosity and grain size on strength, (7) the effect of local stress field on crack nucleation and propagation, (8) stress-induced microcracking mechanism, and (9) stress-induced phase transformation mechanism. (47 refs.) *K.B.*

103291 Mechanical properties of ceramics. III. Hardness and toughness of ceramics. M.Shimada, M.Koizumi (Osaka Univ. Osaka, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.355, p.451-7 (April 1983). In Japanese.
For pt.II see ibid., vol.32, no.354, p.340 (1983). Data on hardness of ceramics is reviewed and values of different materials are plotted for comparison. Methods of determining hardness are outlined. Particular attention is given to the Vickers hardness test and resultant data. In reviewing ceramic toughness, methods of measurement and data obtained are compared. The possibilities for improving the toughness of ceramics are discussed. (12 refs.) *M.O.*

103292 Results of fatigue tests and prediction of fatigue life under superposed stress wave and combined superposed stress wave (case of SCM 435 and $2^1/_4$Cr-1Mo steel, room temperature and 500°C). S.Takasugi, T.Horikawa, T.Tsunenari, H.Nakamura (Tech. Inst., Kawasaki Heavy Industries Ltd., Akashi, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.471-7 (May 1983). In Japanese.
In order to examine fatigue life prediction methods at high temperatures where creep damage need not be taken into account, fatigue tests were carried out on plane bending specimens of alloy steels (SCM 435, $2^1/_4$Cr-1Mo) under superposed and combined superposed stress waves at room temperature and 500°C. The experimental data were compared with the fatigue lives predicted by using the cycle counting methods (range pair, range pair mean and zero-cross range pair mean methods), the modified Goodman's equation and the modified Miner's rule. The fatigue life prediction method which is being used for the data at room temperature is also applicable to predict the life at high temperatures. (12 refs.)

103293 Flexural properties of moldings of rigid polyurethane RIM. H.Yokono, M.Iida, M.Gotoh (Production Engng. Res. Lab., Hitachi Ltd., Yokohama, Japan), Y.Miyano.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.503-8 (May 1983). In Japanese.
Flexural properties of moldings made by RIM (reaction injection molding), which are structural foams consisting of high density skin and low density core, were investigated by three-point bending tests. Two breaking modes were observed in bending tests of the moldings, depending upon the density ratio of skin layer and core layer. The other side of the skin layer on which load was applied was broken by tensile stress. The same side of the skin layer on which load was applied was broken by compressive stress, causing Wrinkling buckling. The conventional composite beam theory was applied to the former breaking mode and Hoff's buckling to the latter, and equations were derived to predict the flexural properties of the structural foams which involve buckling from the flexural properties of solid construction. (8 refs.)

103294 Fracture criterion of flake graphite cast iron. T.Noguchi (Faculty of Engng., Hokkaido Univ., Sapporo, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.516-21 (May 1983). In Japanese.
Fracture criterion of gray cast iron under non-uniform stress was discussed on the basis of bending and eccentric tension tests performed on the rectangular specimens at room and liquid nitrogen temperatures. The experimental results were analyzed with a concept of 'over stressed depth δ', which was proposed as a fracture criterion of notched cast iron. The values of δ, obtained from the calculated stress distribution at fracture and the tensile strength of the material, were almost constant and 2-5 mm for both bending and eccentric tension at room temperature, coinciding with those obtained in notched plates and bars. At liquid nitrogen temperature, δ decreased to less than 1 mm, also coinciding with that in notched tension. Thus the applicability of constant δ as the fracture criterion under the stress gradient conditions was confirmed. (6 refs.)

103295 Relation between bending and direct stress fatigue strengths of steels. S.Koe, H.Nakamura, T.Tsunenari, T.Okada (Tech. Inst., Kawasaki Heavy Industries Ltd., Akashi, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.522-7 (May 1983). In Japanese.
An attempt was made to correlate bending and direct stress fatigue strengths by using the cyclic stress-strain relation of the material. The cyclic stress-strain relation was shown to be representable with the ultimate tensile strength: σ_B as follows $\sigma = 1.73\sigma_B\epsilon_p^{0.16}$. By using this relation, the nominal stress σ_n in bending was calculated and related with the true stress σ at the specimen surface. Then, by replacing the nominal stress by the surface stress, *S-N* curves obtained from the bending and direct stress fatigue tests on S15 CK steel were compared to each other and shown to be in good agreement. Therefore, the bending fatigue strength was found to be correlatable with the reversed direct stress fatigue strength through σ_n-σ diagrams. (9 refs.)

103296 Propagation and non-propagation of fatigue cracks in notched plates of low-carbon steel. Y.Nakai (Dept. of Mech. Engng., Osaka Univ., Suita, Japan), K.Tanaka, R.Kawashima.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.535-41 (May 1983). In Japanese.
Sharply notched specimens of structural low-carbon steel were fatigued under several ratios of maximum to minimum stresses. The growth behavior of a fatigue crack near the notch root was analysed based on the crack closure measurement. A fatigue crack first decelerated with increasing crack length, and then accelerated or became non-propagating depending on the range and ratio of the applied stress. The effective range of the stress intensity factor was found to be the single-valued parameter in describing the growth rate of small cracks near the notch root, and their relation agreed well with that obtained for long cracks. By considering the increase in crack closure stress with crack length, a quantitative method was proposed for predicting the non-propagating crack length and the fatigue strength reduction of notched specimens as a function of the applied stress and the notch geometry. (22 refs.)

103297 Evaluation of fatigue crack growth characteristics of SCM 435 steel by ultrasonic method. K.Hirano, A.Ishii, H.Kobayashi, H.Nakazawa (Faculty of Engng., Tokyo Inst. of Technol., Tokyo, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.542-8 (May 1983). In Japanese.
Fatigue crack growth tests in a wide range of fatigue crack propagation rates covering the threshold condition were conducted at various stress ratios using a quenched-tempered and high strength steel SCM 435 with changing heat treatment. The crack closure behavior due to both the plastic deformation at the crack tip and the formation of oxide deposits on crack faces at an ultralow, near-threshold propagation rate were confirmed experimentally by the proposed Top-on ultrasonic method. The influences of stress ratio, strength level and microstructure on fatigue crack growth characteristics were discussed on the basis of the crack closure concept. It was shown that the fatigue crack propagation rate, da/dN, can be related uniquely to the effective stress intensity factor range, ΔK_{eff}, and the threshold level defined at $da/dN = 10^{-8}$ mm/cycle in terms of effective stress intensity factor range, $\Delta K_{eff,th}$, are nearly constant regardless of stress ratio and strength level. (33 refs.)

103298 High temperature strength of SUS 316 stainless steel subjected to creep damage. K.Yagi, C.Tanaka, K.Kubo, H.Tanaka (Nat. Res. Inst. for Metals, Tokyo, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.556-62 (May 1983). In Japanese.
The tensile, creep and fatigue tests were carried out on stress aged SUS 316 stainless steel in order to clarify the effect of creep damage on fatigue strength. The interaction between creep damage and high temperature strength, especially fatigue life, was discussed. The precipitates of $M_{23}C_6$, χ-phase and Laves-phase were observed, and σ-phase precipitated mainly along grain boundaries in the long-term stress aged material. In the long-term stress aged material the creep cavities were found to exist along the grain boundary particles and non-metallic inclusions in grain. The fatigue life of the stress aged material decreased with increasing ageing time. On the other hand, the fatigue life of the thermal aged material increased by ageing. It was considered that the increase of fatigue life of the thermal aged material was related to structural change, especially the precipitation of carbides, etc., and that the decrease of fatigue life of the stress aged material was related to creep cavities which accelerate fatigue-crack initiation and propagation. (19 refs.)

103299 Thermal fatigue strength of high-temperature structural materials for power plant. K.Kuwabara, A.Nitta, T.Kitamura (Central Res. Inst. of Electric Power Industry, Komae, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.570-6 (May 1983). In Japanese.
In order to investigate the basic thermal fatigue (TF) life properties of materials used for high-temperature components in a power plant, in-phase and out-of-phase TF tests as well as isothermal low-cycle fatigue tests at maximum temperature, T_{max}, were carried out on low-alloy steels, austenitic steel and superalloys. Also, based on these test results, TF life prediction from other mechanical properties was discussed. The dependence of TF life on strain range could be classified into four categories, and two of them (i.e. I- and O-types) showed shorter in-phase and out-of-phase TF lives at low strain ranges. The I-type was due to creep-fatigue interaction in the in-phase TF, while the O-type was caused by the difference in crack initiation life between both phases. The TF lives of low-alloy and stainless steels with low-strength and high-ductility, except a case of the I-type, were almost the same. In general the TF lives of superalloys with high-strength and low-ductility were shorter than those of the above steels, but approached to them at low strain ranges. (13 refs.)

103300 Energetic conditions for brittle fracture. XI. Interaction between strength and elasticity. G.A.Prantskyavichyus.
Liet. TSR Mokslu Akad. Darbai B Ser.(USSR), no.134, p.61-6 (1983). In Russian.
A thermodynamic model of a rod in tension is proposed, being a balance between surface energy and work required for extension, which takes into account nonlinearities in the elasticity of the material and predicts tensile strength. The model is used to calculate the tensile strength of a number of metallic and nonmetallic materials in the form of crystal filments. These data successfully predict the increase in tensile strength of filaments with decreasing cross section. The use of the method to predict tensile strengths of polycrystalline materials is indicated. (9 refs.) *C.J.S.*

103301 Fatigue life of brittle superconducting alloys in normal and superconducting states. L.F.Yakovenko, V.V.Pustovalov, N.M.Grinberg (Phys.-tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.109-12 (Aug. 1983).
The temperature dependence of the fatigue life was studied over a wide temperature range for two superconducting niobium-based alloys which have different brittleness. It was revealed that the transition to the superconducting state in the 50 Nb-50 Ti alloy results in a rapid rise in the fatigue life, while the fatigue lifetime of the 50 Nb-50 Zr alloy is independent of both the superconductor state and the temperature. It is proposed that the difference between the behaviours of the two alloys is due to the different amounts of microplasticity resulting from the cyclic loading. (5 refs.)

103302 Creep fracture in polymers: technique and data handling for a statistical characterization. A.Pavan, G.D'Ariano, L.Benini (Politecnico di Milano, Milan, Italy).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.137-43 (Aug. 1983).
The need for a more thorough statistical characterization of creep fracture in polymers than is usually made is stressed. An automatic recording apparatus that can test a hundred specimens simultaneously is described. An example of data acquisition and handling is given for notched polymethyl methacrylate. The results show a high degree of experimental scatter even for propagation-controlled creep fracture. (12 refs.)

103303 The transition from stage I to stage II fatigue crack propagation in copper single crystals cycled at constant strain amplitudes. A.S.Cheng, C.Laird (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.177-83 (Aug. 1983).
Stage I crack propagation has been studied in smooth specimens of copper single crystals cycled at strain amplitudes corresponding to the plateau of the cyclic stress-strain curve. The transition from stage I to stage II propagation received special attention with respect to crystal orientation. It has been observed that the transition is accompanied by slip on the secondary slip system and the maximum stage I crack length decreases drastically for orientations in which the shear stress on the secondary system more closely approaches that on the primary system. A theory for the transition is offered, based on the postulate that stage II propagation occurs at a stage I crack when work hardening at the tip of the crack in the primary persistent slip band (PSB) raises the resolved shear stress locally acting on the secondary slip system to that required to initiate a PSB in that system. Reasonable agreement between calculated and measured values of the stage I crack length at transition to stage II supports the approach used. (16 refs.)

103304 The micro-mechanisms of tempered martensite embrittlement in 4340-type steels. N.Bandyopadhyay (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), C.J.McMahon,Jr..
Metall. Trans. A (USA), vol.14A, no.7, p.1313-25 (July 1983).
A study of the micro-mechanisms of tempered martensite embrittlement was made on a series of 4340-type steels in which the contents of manganese, silicon, and trace impurities, especially phosphorus and sulfur, were varied. One plain-carbon steel was also examined. The study employed Charpy impact tests and four-point slow-bend tests coupled with an elastic-plastic stress analysis, as well as scanning electron fractography. Auger electron spectroscopy, transmission electron microscopy of extraction replicas, and magnetic measurements of the transformation of retained austenite. The results indicate that in these steels the TME phenomenon is an intergranular embrittlement problem caused by carbide precipitation on prior austenite grain boundaries which are already weakened by segregated phosphorus and sulfur. The transformation of intragranular retained austenite is concluded not to be of primary significance in the TME in these steels, although it may contribute to the magnitude of the TME toughness trough. (38 refs.)

103305 Fatigue of Cu-1 pct Cd. N.Behnood (Dept. of Metall. & Engng. Materials, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England), J.T.Evans.
Metall. Trans. A (USA), vol.14A, no.7, p.1327-32 (July 1983).
The fatigue properties of high conductivity Cu-1 pct Cd are reported. In contrast to Cu, the fatigue strength of Cu-Cd is grain-size dependent in high cycle fatigue. Strain aging is responsible for the superior fatigue properties of Cu-Cd, and the effect of dislocation pinning is carried over to the cold work state, giving a work hardened structure which is stable in fatigue loading. A notable feature of the results is that fatigue fracture in Cu-Cd is almost entirely intergranular at long fatigue lives, in contrast to the fracture in tensile loading and in contrast to the transgranular fracture which was observed in Cu. The effect is due to segregation of Cd at the grain boundaries and to the effect of Cd on the cohesive strength of the boundary. Moderate cold work suppresses intergranular fracture. (14 refs.)

103306 Deformation and fracture of strongly textured Ti alloy sheets in uniaxial tension. K.S.Chan (Dept. of Metall. Engng., Michigan Technol. Univ., Houghton, MI, USA), D.A.Koss.
Metall. Trans. A (USA), vol.14A, no.7, p.1333-42 (July 1983).
The influence of crystallographic texture on the deformation and fracture behavior of strongly textured Ti alloy sheet has been investigated. Uniaxial tensile tests have been performed on Ti-6Al-4V and Ti-5Al-2.5 Sn sheet with both a basal and a basal-transverse texture. The results indicate that, by controlling the ease of through-thickness slip, the crystallographic texture strongly affects the plastic anisotropy of the material but has relatively little effect on the strain-rate sensitivity and work-hardening rates at large strains. A strong resistance to through-thickness slip, manifested by a high R-value, enhances the post-uniform elongation and the ability of the material to retain the load-carrying capacity beyond maximum load. This behavior can be qualitatively understood in terms of the effect of R on the hardening which occurs as the strain state within the diffuse neck shifts from uniaxial tension toward plane strain. A higher R-value also increases significantly the limit strain at the onset of localized necking as well as the fracture strain. (27 refs.)

103307 Stretch forming and fracture of strongly textured Ti alloy sheets. K.S.Chan (Dept. of Metall. Engng., Michigan Technol. Univ., Houghton, MI, USA), D.A.Koss.
Metall. Trans. A (USA), vol.14A, no.7, p.1343-8 (July 1983).
The influence of plastic anisotropy and R-value on the stretch forming and fracture behavior of strongly textured Ti-6Al-4V and Ti-5Al-2.5Sn sheets has been examined utilizing sheet specimens with a wide range of R-values but with similar word hardening and strain-rate sensitivity characteristics. The results indicate that a high R-value and difficult through-thickness slip enhance the forming limit as well as fracture strains when the minor strain in the plane of the sheet is negative, this effect being most pronounced at uniaxial tension. At plane strain, the R-value has little or no influence on the limit or fracture strain. A direct determination of the effect of R-value on the biaxial stretch forming characteristics of Ti-6-4 sheet is precluded by the intervention of fracture prior to localized necking when the minor strain is positive. The influence of plastic anisotropy on both the localized necking and the fracture behavior can be generally understood in terms of the difficulty of attaining critical thickness strains as through-thickness slip becomes more difficult. (25 refs.)

103308 Statistical aspects of cleavage fracture in steel. A.G.Evans (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1349-55 (July 1983).
The fracture of mild steel in the cleavage range has been evaluated using a weakest link statistical model, assuming the preexistence of a distribution of cracked carbides. The model provides a rationale for the critical fracture distance, namely the distance from the crack tip at which the probability of cleavage cracking exhibits a maximum. The critical distance depends on the size distribution and volume fraction of carbides. The model also predicts trends in K_{IC} with material properties: flow strength, cracked carbide size and volume fraction, and grain size. The resultant temperature dependence of K_{IC} is shown to derive exclusively from the temperature dependence of the flow stress, as in prior models. The effects of microstructure on K_{IC} depend primarily on the size distribution of cracked carbides, with additional influences of the grain size and of the volume fraction of carbides. (21 refs.)

103309 Effect of prestrain on the mechanical properties of eutectoid steel. M.C.Juhas (Dept. of Metall. Engng. & Materials Sci., Carnegie-Mellon Univ., Pittsburgh, PA, USA), I.M.Bernstein.
Metall. Trans. A (USA), vol.14A, no.7, p.1379-88 (July 1983).
This investigation was designed to study the effect of prior compressive deformation and temperature on the subsequent dynamic fracture toughness, K_{Id}, of fully pearlitic 1080 rail steel. Charpy instrumented impact tests on precracked specimens were performed at room temperature at a variety of prior strain levels from 0 to 20 pct. In addition, transition temperature tests were performed on specimens of zero, low (5 to 10 pct), and high (15 to 20 pct) prior strains. Dynamic fracture toughness (K_{Id}) and energy absorbed per fractured area (W/A) were obtained from instrumented impact data. It was found that, at room temperature, compressive strain had no effect on either K_{Id} or W/A. In the transition temperature range, W/A decreased with increasing prior strain, while there was no effect on K_{Id}. At temperatures in the upper shelf region, prior strain decreased both K_{Id} and W/A. There was no effect on the transition temperature as the amount of prior strain was increased. Thus, while both dynamic fracture toughness and impact properties can be significantly changed by varying temperature, cold working the material has at best a modest effect on impact energy and then primarily only in the upper shelf region. (21 refs.)

103310 Tempered martensite embrittlement in Fe-Mo-C and Fe-W-C steel. H.Kwon, C.H.Kim (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Metall. Trans. A (USA), vol.14A, no.7, p.1389-94 (July 1983).
A study on the phenomenon of tempered martensite embrittlement (TME) has been made in experimental Fe-Mo-C and Fe-W-C steel. Charpy impact testing was conducted to evaluate the impact toughness, sensitive to TME. Retained austenite was observed by an analytical transmission electron microscopy in both steels. Both steels represented TME. TME was correlated with the formation of the interlath cementite, resulting from the decomposition of interlath retained austenite. TME occurred in a limited range of test temperatures where the interlath cementite could act as a source of embrittling cracks. Therefore, both the interlath cementite resulting from the decomposition of the interlath retained austenite, and the level of matrix toughness, enabling the interlath cementite to act as an effective embrittler, are necessary to produce TME. (16 refs.)

103311 The influence of the $M_{23}(C,N)_6$ compound on the mechanical properties of type 422 stainless steel. P.R.Landon (Lawrence Livermore Nat. Lab., Livermore, CA, USA), R.D.Caligiuri, P.S.Duletsky.
Metall. Trans. A (USA), vol.14A, no.7, p.1395-408 (July 1983).
Ductility and toughness of type 422 stainless steel was shown to be strongly influenced by either the presence or absence of large grain boundary precipitates of the $M_{23}(C,N)_6$ compound. A lengthy, isothermal solution heat treatment combined with a longer, lower temperature precipitation heat treatment was used to exaggerate the $M_{23}(C,N)_6$ compound along the boundaries of large austenite grains. After a subsequent conventional heat treatment, the presence of this compound along the prior austenite grain boundaries substantially reduced the ductility and the Charpy V-notch impact energy. The primary fracture mode was intergranular failure along these prior austenite grain boundaries. This is a reversible process and this compound can be completely dissolved. The $M_{23}(C,N)_6$ compound was removed from these prior austenite grain boundaries by another lengthy, isothermal resolution heat treatment. After a subsequent conventional heat treatment, the ductility returned to values which are near those found in as-received and heat treated material; the Charpy V-notch impact energy increased to values above that found in commercially processed type 422 stainless steel. The fracture appearance returned to the more normal transgranular ductile dimple mode. (19 refs.)

103312 Localized heat generation during fracture of cyclically loaded steel. P.J.Loos (Res. Lab., Hughes Tool Co., Houston, TX, USA), F.R.Brotzen.
Metall. Trans. A (USA), vol.14A, no.7, p.1409-19 (July 1983).
A theoretical model describing heat generation in the plastically deforming region near a crack tip under cyclic loading conditions has been developed. It predicts crack-tip temperature as a function of stress-intensity amplitude, cyclic loading frequency, time under load, and material parameters. Crack-tip temperatures are measured in AISI 4135 steel at a loading frequency of 20 Hz by employing a scanning infrared camera system. Measured temperatures compare reasonably well with values predicted by the theoretical model. Temperature changes are small under prevailing testing conditions. (23 refs.)

103313 Surface deformation and crack initiation during fatigue of vacuum melted iron: environmental effects. D.Majumdar, Yip-Wah Chung (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1421-5 (July 1983).
Samples of vacuum melted commercially pure iron were fatigued in the reverse bending mode in different environments including ultrahigh vacuum, oxygen, water vapor, and their combinations. Reverse bending alternating stress in ultrahigh vacuum produced a rumpled surface (without any prominent slip lines) with cracks initiated along grain boundaries. In the presence of oxygen, such fatigue generated well-developed slip lines. Fatigue cracks were observed more along slip lines than grain boundaries. When the same sample was fatigued in both ultrahigh vacuum and oxygen in succession, the resulting surface structure was dependent on the order in which two environments were employed. In water vapor, there was a reduction in surface deformation at low pressures and coarse, prominent slip lines at high pressures. It also caused grain sliding and void formation. In an environment of water vapor and oxygen, fatigue caused grain boundary cracking and reduced plastic deformation inside grains surrounded by those cracks. Possible reasons for these observations are discussed. Suggestions are also made for utilizing some of these findings to improve the fatigue performance of metals. (34 refs.)

103314 Comparison of the plane strain crack arrest fracture toughness of 4340, 4140, and 1340 steel. E.J.Ripling (Materials Res. Lab. Inc., Glenwood, IL, USA), J.H.Mulherin, P.B.Crosley.
Metall. Trans. A (USA), vol.14A, no.7, p.1459-65 (July 1983).
The plane strain crack arrest fracture toughness of 4140 and 1340, both in a fully martensite condition, was measured over a yield strength range of 965 to 1240 MPa, and a test temperature range of -54 to 74°C. These results were compared with each other and with the data collected earlier on 4340. The 4340 was found to be far tougher than the other two alloys at all yield strengths and test temperatures. The 4140 was tougher than the 1340, although the difference appeared to decrease as the yield strength increased. The toughness of the fully hardened 4140 was also compared with the toughness measured earlier on a 25 pct thicker plate that did not through-harden. Although all data were plane strain, there was a sizable toughness loss for the plate that was not through-hardened. Crack arrest fracture toughness was found to be sensitive to steel composition, test temperature, yield strength, and microstructure. (8 refs.)

103315 Creep crack growth behavior of several structural alloys. K.Sadananda, P.Shahinjan (Naval Res. Lab., Washington, DC, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1467-80 (July 1983).
Creep crack growth behavior of several high temperature alloys, Inconel 600, Inconel 625, Inconel X-750, Hastelloy X, Nimonic PE-16, Incoloy 800, and Haynes 25 (HS-25) was examined at 540, 650, 760, and 870°C. Crack growth rates were analyzed in terms of both linear elastic stress intensity factor and J^*-integral parameter. Among the alloys Inconel 600 and Hastelloy X did not show any observable crack growth. Instead, they deformed at a rapid rate resulting in severe blunting of the crack tip. The other alloys, Inconel 625, Inconel X-750, Incoloy 800, HS-25, and PE-16 showed crack growth at one or two temperatures and deformed continuously at other temperatures. Crack growth rates of the above alloys in terms of J^* parameter were compared with the growth rates of other alloys published in the literature. Alloys such as Inconel X-750, Alloy 718, and IN-100 show very high growth rates as a result of their sensitivity to an air environment. Based on detailed fracture surface analysis, it is proposed that creep crack growth occurs, by the nucleation and growth of wedge-type cracks at triple point junctions due to grain boundary sliding or by the formation and growth of cavities at the boundaries. (48 refs.)

103316 Low cycle fatigue of Ti-Mn alloys: microstructural aspects of fatigue crack growth. Y.Saleh (Metals Res. Labs., Olin Corp., New Haven, CT, USA), H.Margolin.
Metall. Trans. A (USA), vol.14A, no.7, p.1481-6 (July 1983).
Fatigue crack path behavior of a series of Ti-Mn alloys heat treated to produce volume fractions of the alpha phase ranging from 0 to 97.5 pct was investigated. Both Widmanstatten and equiaxed morphologies of the α phase were used in the study. Interior and surface crack paths are discussed in terms of slip behavior and microstructural details. (12 refs.)

103317 The effect of hydrogen gas on the plasticity/cleavage balance in Fe-3.5 pct Si. J.T.Evans (Dept. of Metall. & Engng. Materials, Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England), D.Hardie, R.J.Harrison.
Metall. Trans. A (USA), vol.14A, no.7, p.1505-10 (July 1983).
Notched specimens of grain-oriented iron-3.5 pct silicon were strained in air and in hydrogen gas at different displacement rates. The presence of hydrogen was found to induce cleavage fracture, mainly on the cube face planes, whereas fracture in air under the same conditions was ductile. A notable feature of the results is that some cleavage fracture, apparently occurring on the (110) plane, was seen in specimens strained at right angles to the rolling direction. The presence of hydrogen was found to induce cleavage most easily at the fast and intermediate displacement rates; at the slowest strain rate the specimens were much more ductile. It is believed that the dynamic component of the flow stress must be maintained above a critical level to allow the hydrogen to alter the balance between cleavage fracture and ductile plastic flow in favor of cleavage. (25 refs.)

103318 Oxide scale induced cleavage fracture in an ODS Fe-Cr-Al alloy. J.M.Davidson, C.M.Austin, M.L.Robinson (Inco Alloy Products Co. Res. Center, Suffern, NY, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1516-18 (July 1983).
A novel mode of cleavage initiation has been observed in an oxide dispersion strengthened (ODS) ferritic stainless steel, INCOLOY alloy MA 956. Cleavage fracture in this alloy can be initiated by the presence of a surface oxide scale developed during elevated temperature exposure. This mechanism appears to be related to complex interactions between the oxide scale and the underlying alloy substrate during post-exposure deformation. (15 refs.)

103319 Flow localization accompanying the intergranular fracture of Ni_3Al. E.M.Schulson (Thayer School of Engng., Dartmouth Coll., Hanover, NH, USA), D.L.Davidson, D.Viens.
Metall. Trans. A (USA), vol.14A, no.7, p.1423-4 (July 1983).
Using the method of selected area electron channelling in scanning electron microscopy it was found that localized plastic flow accompanies the intergranular propagation of cracks in Ni_3Al broken under uniaxial tension at room temperature. (5 refs.)

103320 Fatigue crack growth rate of Ti-6Al-4V prealloyed powder compacts. S.W.Schwenker (Air Force Wright Aeronaut. Labs., MLLS, Wright-Patterson Air Force Base, OH, USA), A.W.Sommer, D.Eylon, F.H.Froes.
Metall. Trans. A (USA), vol.14A, no.7, p.1524-8 (July 1983).
The fatigue performance of powder metallurgy material is compared with that of ingot metallurgy materials. It was found that microstructure influenced the fracture path in both cases. Fractographic features of prealloyed power compacts of Ti-6Al-4V were observed in both the low and high stress intensity regimes. (16 refs.)

103321 Microfracture model for hydrogen embrittlement of austenitic steels. R.E.Stoltz (Exxon Corporate Res. Lab., Linden, NJ, USA), N.R.Moody, M.W.Perra.
Metall. Trans. A (USA), vol.14A, no.7, p.1528-31 (July 1983).
A microfracture model based on a critical local stress for intergranular fracture is used to explain hydrogen embrittlement effects in austenitic steels. The model predicts variations in the size of a partially cracked region which is observed at crack arrest threshold. A critical stress for fracture in 200 MPa hydrogen gas at 298K of $\approx$2800 MPa is consistent with the data. Increases in grain size are predicted to raise the lower limiting threshold value for high strength alloys, if grain boundary segregation effects are eliminated. (20 refs.)

103322 Lower-tail approximations for the probability of failure of three-dimensional fibrous composites with haxagonal geometry. R.L.Smith (Dept. of Math., Imperial Coll., London, England), S.L.Phoenix, M.R.Greenfield, R.B.Henstenburg, R.E.Pitt.
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.353-91 (8 Aug. 1983).
The chain-of-bundles model for the strength of unidirectional fibrous materials is extended to cover 3D situations wherein the parallel filaments are arranged laterally in a hexagonal array. Within each bundle, the strengths of the fibres vary statistically and share load according to a local load-sharing rule, a rule which describes how the loads of failed fibres are redistributed on to nearby surviving fibres. The authors consider two idealized versions of this rule, one geometrically motivated and the other more mechanically motivated. They extend earlier asymptotic techniques for the 2D planar problem to the present 3D case, and obtain various approximations for the probability distribution of material strength. The Weibull distribution again emerges as central to the results, but the calculation of its shape and scale parameters is greatly complicated by the large number of new failure configurations that may arise in the haxagonal array of fibres. (17 refs.)

103323 Energy criterion for modelling creep rupture of high-density polyethylene. B.W.Cherry, Teoh Swee Hin (Dept. of Materials Engng., Monash Univ., Clayton, Victoria, Australia).
Polymer (GB), vol.24, no.8, p.1067-70 (Aug. 1983).
A technique involving the use of a three-element mechanical model with a critical stored energy criterion modelled accurately the creep rupture time of two types of high-density polyethylene (HDPE) specimens. The upper stress limit where the specimen ruptured immediately on application of load and the lower stress limit where the specimen sustained the load indefinitely were also features of the model. These two limits were found to depend on the resilience, elastic modulus and anelastic modulus of the HDPE. (21 refs.)

103324 Notch sensitivity and fractography of polyolefins. R.D.Goolsby, A.M.Chatterjee (Westhollow Res. Center, Shell Dev. Co., Houston, TX, USA).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.117-24 (Feb. 1983). [received: July 1983]
The notch sensitivity of high-density polyethylene (HDPE), polypropylene (PP), and polybutylene (PB) was evaluated using uniaxial tensile deformation and fractographic analysis. Each polyolefin was tested at relatively low and high molecular weights (MW). Only the lower MW HDPE was found to be clearly notch-sensitive. The lower MW PP exhibited some tendency toward notch sensitivity. The lower and higher MW PB, the higher MW HDPE, and the higher MW PP displayed notch strengthening. Whereas PB showed similar notched tensile performance regardless of molecular weight, both HDPE and PP showed higher susceptibility to notch sensitivity at lower molecular weights (and concomitant higher crystallinity). Tendencies toward notch sensitivity or notch strengthening were evidenced in the failure modes of these materials. (15 refs.)

103325 Ductile fracture of a high manganese steel. M.A.Shtremel', S.A.Nikulin, V.P.Kanev.
Russ. Metall. (GB), no.4, p.87-96 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.98-106 (1981). [received: June 1983]
Depending on the magnitude of the strain hardening exponent n, there are two alternative conditions for neck formation in tensile loading: at low n, it is the geometrical loss of flow stability for the strain $e_p=n$ while at high n stability is lost prior to reaching the strain $e=n$; evidently, this is caused by 'internal necking' (macrocracks on the axis of the specimen). As in the case of dimpled fracture, star or separation fracture starts at the 'bottom' crack on the axis of the specimen. This crack changes to an axial crack because of the anisotropy of the resistance to fracture. Axial fracture in steels with 5-9% Mn takes place completely at grain boundaries and is caused by temper brittleness. The anisotropy of the resistance to grain boundary fracture is caused by plastic elongation of the grains. (12 refs.)

103326 Low-cycle fatigue of the non-magnetic ageing 40G18N13F and 35Kh14G16N10FR steels at +20° and −196°C. V.M.Blinov, M.A.Kablukovskaya, Yu.P.Liberov, V.I.Skol'tsov, G.A.Stepanov.
Russ. Metall. (GB), no.4, p.97-101 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.107-11 (1981). [received: June 1983]
The fatigue strength diagram for 40G18N13F and 35Kh14G16N10FR steels under cyclic tension consists of repeated-static and fatigue-fracture regions. On the basis of 10^4 cycles, the cyclic strength of these steels at +20 and −196°C reached 80 and 100-110 kg/mm^2, respectively. The cyclic strength and the fatigue life of both steels increases as a result of ageing and with reduced test temperature. The notch sensitivity is manifested by the fact that the fatigue life of notched specimens is reduced by an order of magnitude, compared with smooth ones, in the range of stresses considered. A notch does not affect repeated-static failure appreciably. The ductile behaviour in the grain boundary zones which are free from precipitates of the hardening phase help to preserve in 35Kh14G16N10FR steel a higher cyclic strength and endurance life at −196°C than in the case of 40G18N13F steel, in spite of its greater tendency to develop intergranular failure. (5 refs.)

103327 Influence of martensite content on the hydrogen embrittlement of dual-phase steels. R.G.Davies (Ford Motor Co., Dearborn, MI, USA).
Scr. Metall. (USA), vol.17, no.7, p.889-92 (July 1983).
The ability of a crack to nucleate and grow in a hydrogen charged dual-phase steel will be a function of the strength (carbon content), size and distribution of the martensite islands. Increased carbon content, that is increased yield strength, will promote the likelihood of hydrogen embrittlement, and it certainly will occur for carbon contents exceeding 0.15%. Cracks may never develop and link-up if the martensite regions are small and widely dispersed. This influence of martensite morphology on the reversible hydrogen embrittlement of dual-phase steels, was studied in a series of low carbon steels heat-treated so as to produce ferritic structures containing from 5 to 45% martensite. (6 refs.)

103328 A comparison of microvoid sizes in nickel base alloys tested in air and in the presence of hydrogen. C.E.Price, L.B.Traylor (School of Mech. & Aerospace Engng., Oklahoma State Univ., Stillwater, OK, USA).
Scr. Metall. (USA), vol.17, no.7, p.901-4 (July 1983).
Presents some results upon the relative void sizes of Nickel 200 (UNS N02200) tested in air and in hydrogen, along with comparative data on Inconel 625. Both annealed and cold worked alloys were investigated. Breaks in air were of the customary cup and cone type for both alloys. By contrast, fractures in hydrogen began at the surface and were neither cup and cone nor 100% microvoid coalescence, irrespective of alloy and condition. At the periphery there was a zone of intergranular, slip plane, or largely featureless slant fracture. Once the fracture mode transition occurred in hydrogen, there was no systematic change in microvoid size over the remaining cross section. (11 refs.)

103329 Fracture mechanics in the presence of electrical fields. V.Z.Parton, B.A.Kudryavtsev (Moscow Inst. of Chem. Engng., Moscow, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.371-81 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.3-15 (Sept.-Oct. 1982).
The following topics are discussed: equations of linear electrothermoelasticity; brittle fracture mechanics methods applied to piezoelectric materials; an arbitrarily oriented straight crack in an unlimited piezoelectric medium, and the plane problem for an unlimited piezoelectric medium with a crack in the plane of symmetry. (9 refs.)

103330 Combined manifestation of the factors of surface roughness and loading frequency in the fatigue of patented wire. O.N.Romaniv, L.P.Laz'ko, Yu.V.Zima (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.454-8 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.93-6 (Sept.-Oct. 1982).
The authors have established an increase in fatigue life at a frequency of 50 Hz for polished wire. This they have explained is due to the elimination in polishing of deep production stress raisers. However, they have found no such effect at low frequency when the fatigue resistance both of polished and the original wire is of the same low level, equal to the fatigue resistance of unpolished wire at a frequency of 50 Hz. (6 refs.)

103331 Fatigue damage caused to the material by inelastic loading with periods of load holding. K.M.Kononov, V.B.Poroshin, O.S.Sadakov (Chelyabinsk Polytech. Inst., Chelyabinsk, USSR).
Strength Mater. (USA), vol.14, no.7, p.883-7 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.23-6 (July 1982).
New parameters of state obtained in analyzing the structural model and describing the strain properties of structural materials in a cyclically stable condition during repeated-variable loading with periods of holding the load are proposed for use in the model of damage accumulation. These parameters, regardless of the fact that they can be macroscopically determined, characterize integrally the effects connected with the microheterogeneity of the material and have a definite physical content. A very simple version of the kinetic equation of state is proposed for determining the rate of damage accumulation which produces equations for the number of cycles to fracture resembling the method of rate partitioning. The equation enables the determination of fatigue life for complex regular cyclic loading breaks under load with holdings. The comparison of the model with the experimental data shows its adequacy (especially for pure shear) and also a systematic deviation in cycles with holdings of compressive load. (9 refs.)

103332 Correlation between cyclic plastic strain zone size and the fatigue fracture rate of 15Kh2MFA steel at low temperatures. L.R.Botvina, G.V.Klevtsov, V.M.Markochev, A.P.Bobrinskii (A.A. Baikov Inst. of Metall., USSR).
Strength Mater. (USA), vol.14, no.7, p.887-91 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.27-30 (July 1982).
An investigation was made of the cyclic plastic strain zone h under fatigue fracture surface as a function of test temperature and of the stress intensity factor range. Steel 15Kh2MFA was used as the investigation object and the initial ferrite grain size was $d=(4\text{-}5)\times10^{-5}$ m. An X-ray method was used to measure the cyclic plastic zone depth and plastic strain on fracture surfaces. (13 refs.)

103333 Effect of preliminary mechanical twinning on the ductile-brittle transition temperature for iron with different impurity contents. I.A.Gindin, L.A.Chirkina, V.S.Oskovit, V.M.Azhazha (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.968-71 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.95-7 (July 1982).
The work concerns a study of the effect of impurity atoms on the alteration of mechanical properties of iron by preliminary twinning. The study was carried out on pure iron ZhSO from a vacuum electron-beam melt and iron containing 3% silicon. The chemical composition of the test metals is given. Specimens of pure and silicon iron were deformed up to 0.8% by twinning at 80-100K, then annealed at 720K for 2 h in order to relax stresses at the tips and coherent boundaries of twins. The alteration in yield point with slip σ_s and twinning σ_z, the true fracture stress S_K, and relative elongation δ_{tot} in relation to temperature for original pure and silicon iron specimens and those deformed by twinning are given. (7 refs.)

103334 Local exothermic effects during failure of rubber. V.I.Dyrda (Inst. of Geotech. Mech., Acad. of Sci., Dnepropetrovsk, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.977-9 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.102-4 (July 1982).
During fracture of rubber local exothermic effects have been studied by means of direct experimental methods (IR radiation method); it has been shown by experiment that in individual macroregions of rubber the warm-up temperature may reach that for thermal destruction. (10 refs.)

103335 Fracture toughness of Mn-Zn ferrite single crystal. T.Nishikawa, Y.Okamoto, S.Inagaki (Dept. of Chem., Kyoto Inst. of Technol., Kyoto-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.149-56 (1983). In Japanese.
Mn-Zn ferrite crystals were fractured along the main low-index planes (100), (110) and (111) to obtain fracture toughness (K_{Ic}) for each plane. A controlled surface flaw (CSF) technique and indentation fracture (IF) technique were used. In the CSF technique, microplastic zones around vickers impressions were identified by slip traces. Removal of the zones by surface grinding resulted in the elimination of residual stress. In the IF technique, the proposed expressions for K_{Ic} evaluation and the effects of surface treatment were discussed. The plane of lowest toughness was (110) with K_{Ic} of 1.14 ± 0.06 $MN/m^{3/2}$ in CSF technique. For IF technique, there was a difference in K_{Ic} between chemically and mechanically polished surfaces: $K_{Ic}=0.73\pm0.02$ $MN/m^{3/2}$ for the former, $K_{Ic}=1.09\pm0.09$ $MN/m^{3/2}$ for the latter (indentation load:100 gf to 300 gf, crack to impression ratio:3 to 4). Etching after indentation resulted in underestimation of K_{Ic} because of crack growth. (24 refs.)

103336 Room temperature strength of sintered β-Sialon. M.Mitomo (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan), S.Nagata, M.Tsutsumi, Y.Fujii.
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.171-5 (1983). In Japanese.
The strength of sintered β-Sialon was measured at room temperature. The average strength was 534 MPa. The Weibull modulus calculated from 25 measurements was 6.5. The value excluding two abnormally low strength specimens was 8.8, comparable to that of hot-pressed β-Sialon. The fractures were originated from surfaces or interior defects. The average strength and Weibull modulus of specimens fractured from surfaces were 490 MPa and 4.7, respectively, while those fractured from the interior was 564 MPa and 10.6, respectively. Almost all of the interior defects were large voids or clustered pores. The surface defects were flaws or interior defects exposed to surfaces by polishing. (15 refs.)

103337 Fracture toughness of polycrystalline Ni-Zn ferrite and polycrystalline Ba ferrite. T.Nishikawa, Y.Okamoto, S.Inagaki, K.Kuwahata, M.Tasaki (Dept. of Chem., Kyoto Inst. of Technol., Kyoto-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.240-50 (1983). In Japanese.
Fracture toughness (K_{IC}) for polycrystals of Ni-Zn ferrite (grain size; 22 μm) and Ba hexaferrite (grain size; 3.5 μm) was measured at room temperature and elevated temperatures up to 1000°C. Room-temperature K_{Ic}'s determined by the controlled surface flaw (CSF) technique for Ni-Zn ferrite and Ba ferrite were 1.50 ± 0.12 and 2.97 ± 0.16 $MN/m^{3/2}$, respectively. In the indentation fracture (IF) technique, different K_{Ic} values were obtained, depending on the equations proposed to evaluate K_{Ic} and the indentation load for testing. There was a difference in fracture mode at room temperature between the two ferrites: transgranular fracture with relatively smooth surface in Ni-Zn ferrite, and intergranular fracture or cleavage of a specific plane in each grain with rough surface on a grainsize-scale in Ba ferrite. There were also differences in K_{Ic} value and fracture behavior at elevated temperatures between the two ferrites. (22 refs.)

(see also 62.20P Tribology)

103338 A study of the frictional, wear and contact resistance performance of tin alloy coatings. W.Baumann, W.Degner, J.Fiedler, J.Horn, G.Richter, C.Weissmantel (Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Thin Solid Films (Switzerland), vol.105, no.4, p.305-18 (29 July 1983).
The purpose of the present experimental study is to give an assessment of the extent to which tin alloy coatings are suitable as connector contact finishes in low power circuit applications. Sn-Pb and Sn-Ni alloy coatings were electrodeposited onto tin bronze and partially exposed to a thermal post-treatment. The performance of Sn-Pb-coated contacts during mutual sliding is characterized by significant decreases in the frictional force and in its range of variation and, simultaneously, by an increase in the contact resistance by several orders of magnitude after a certain number of sliding cycles. Similar results were obtained for Sn-Ni coatings. Investigations of the properties and structure of the coatings have clarified both the influence of heat treatment and the changes in frictional and contact resistance performance during sliding stress. For Sn-Pb coatings a partial phase transition to metastable α-Sn due to mechanical stress was shown to occur along the wear tracks. (2 refs.)

81.60 CORROSION, OXIDATION AND SURFACE TREATMENTS

103339 On the mechanism of stress corrosion of E-glass fibres. F.R.Jones, J.W.Rock (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.415-18 (Aug. 1983).
The authors have studied and compared the stress corrosion failure times of single E-glass filaments in aqueous sulphuric acid and aqueous sodium bisulphate solutions of similar pH. The results suggested that the bisulphate ion, HSO_4^-, is involved in the stress corrosion mechanism. (18 refs.)

103340 Thinning of InP by chemical etching. S.Aytac, A.Schlachetzki, H.-J.Prehn (Inst. fur Hochfrequenztech., Tech. Univ. Braunschweig, Braunschweig, Germany).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.447-50 (Aug. 1983).
The authors report on a method how thin InP films can be obtained in a simple manner with good control. The salient features to assess the performance of an etchant are the quality of the etched surface, the etching rate and the reproducibility, i.e. the factors controlling the etch attack must be well known. The experiments reported were performed with (100) oriented, 250 μm thick InP crystals supplied with one side mirror. This side was subjected to the etching treatment. (15 refs.)

103341 The environmental degradation of notched CFRP in compression. R.T.Potter, D.Purslow (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).
Composites (GB), vol.14, no.3, p.206-25 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The effect of mechanical pre-loading on the subsequent environmental degradation of notched CFRP specimens has been investigated. Notched compressive strengths were measured using specimens conditioned to give about a 1% moisture content some of which had been preloaded in the dry state. The microstructural factors governing the mechanisms of failure and the resultant strengths have been examined fractographically. It is shown that even quite high levels of pre-loading are unlikely to affect the extent of subsequent environmental degradation. (13 refs.)

103342 Environmental resistance of carbon fibre-reinforced polyether etherketone. F.N.Cogswell, M.Hopprich (Petrochem. & Plastic Div., ICI, plc, Welwyn Garden City, England).
Composites (GB), vol.14, no.3, p.251-3 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The use of thermoplastic resins as suitable matrix materials for structural composites is discussed. Results of tests on carbon fibre-reinforced polyether etherketone indicate that this material demonstrates satisfactory resistance to aerospace environments and, in particular, is insensitive to moisture even when hot. (14 refs.)

103343 Factors affecting the stress corrosion of GRP in acid environments. P.J.Hogg (Dept. of Metall. & Materials Sci., Univ. of Liverpool, Liverpool, England).
Composites (GB), vol.14, no.3, p.254-61 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
GRP fails by stress corrosion in acid environments which may result in catastrophic fracture. As design confidence in GRP improves and the value of arbitrary 'safety factors' is reduced, the need for reliable data on the long term behaviour of GRP in aggressive environments becomes increasingly important. Three factors which control stress corrosion, i.e. resin, fibre and gel-coats are considered. It is demonstrated that useful improvements may be achieved by varying the resin type and that the optimum resin system must be determined on the basis of mechanical as well as chemical properties. In addition, significant improvements are possible using acid-resistant glass fibre types. The use of resin gel-coats is shown to provide an excellent barrier to acid attack but gel-coat integrity is vital and damaged gel-coats are deleterious. (22 refs.)

103344 Stress corrosion cracking and its implications for the long-term durability of E-glass fibre composites. F.R.Jones, J.W.Rock, A.R.Wheatley (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).
Composites (GB), vol.14, no.3, p.262-9 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The environmental stress corrosion cracking modes of model E-glass fibre-reinforced laminates in aqueous acidic environments, under both bending and tensile loads are discussed. The polyester resin protects the glass fibres more effectively than the epoxy resin, such that the apparent limiting failure strain for fracture within the environment is considerably in excess of that required for unprotected fibres. The failure of the unimmersed half of the polyester laminate after a year's exposure to aqueous sulphuric acid, has considerable implications for the long-term durability of stressed GRP. Further evidence for the reduction in the transverse failure strain of the epoxy coupons is also presented. These results therefore demonstrate that the stress corrosion resistance of GRP at low strains may be controlled by the rate of degradation of the fibre/resin interface. (24 refs.)

103345 Prediction of long-term stress-rupture life for glass fibre-reinforced polyester composites in air and in aqueous environments. M.G.Phillips (School of Materials Sci., Univ. of Bath, Bath, England).
Composites (GB), vol.14, no.3, p.270-5 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
Commences with a discussion of the assumptions embodied in the normal method of presenting results of environmental stress-rupture tests. Results are presented from two test programmes on glass fibre-reinforced polyesters: a chopped strand mast laminate in air; and a mixed woven rovings/chopped strand mat laminate in aqueous environments, revealing very large experimen-

tal scatter. The author then describes methods which have been employed in an attempt to extract from the data predictions of the long term behaviour of the composites and indications of the environment upon them. (9 refs.)

103346 A new self-limiting process for the production of thin submicron semiconductor films. K.C.Lee, J.Silcox, C.A.Lee (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA).

J. Appl. Phys. (USA), vol.54, no.7, p.4035-7 (July 1983).

This paper describes a new anodic etching technique for the fabrication of device quality, self-limited, thin submicron semiconductor films. The technique relies upon the creation of a thin slightly damaged surface layer in the semiconductor by low dosage ion implantation. Evidence is presented to show that the lifetime of holes in this layer is drastically reduced causing the etching rate to decrease by a factor of several thousand when the damaged layer is exposed to the anodic etching solution. (8 refs.)

103347 Anodic oxide films on $Pb_{1-x}Sn_xSe$. S.C.Gupta, H.J.Richter (Fraunhofer-Inst. fur Phys. Messtech., Freiburg, Germany).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1469-72 (July 1983).

The process for forming the anodic oxide on $Pb_{1-x}Sn_xSe$ ($x \sim 0.068$) using a constant current source is studied. The electrolyte is composed of N-methyl acetamide, water, and propylene glycol. Reproducible films are obtained with the electrolyte when adjusted to $p\mathrm{H}=6.6 \pm 0.2$ by using oxalic acid and ammonium hydroxide. Surface analysis using X-ray photoelectron spectroscopy has been made. All the three components Pb, Sn, and Se participate in the oxidation. The anodic oxide is composed of PbO, SnO_2, and an oxide of Se. (19 refs.)

103348 Planarization properties of resist and polyimide coatings. L.K.White (RCA Labs., Princeton, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1543-8 (July 1983).

The planarization properties or thickness changes on topographical features are examined in detail for several types of spun-on polymer films. A profilometer is used to measure the step height changes of isolated line features of various dimensions. The viscosity of the solution appears to give a reasonable indication of the spun-on planarization properties. However, in many cases, the thermal flow of the polymer during a subsequent curing procedure is the dominant planarization mechanism. Methods for producing highly planarized surfaces with positive resist materials are described along with the effects of feature size on the planarization properties. (22 refs.)

103349 Oxidation of arsenic implanted polycrystalline silicon. E.Kinsbron, S.P.Murarka, T.T.Sheng, W.T.Lynch (Bell Labs., Murray Hill, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1555-60 (July 1983).

The techniques of Rutherford backscattering spectrometry, neutron activation, and transmission electron microscopy were employed in this extensive study of the thermal oxidation of arsenic implanted polycrystalline silicon (polysilicon) films. Some evidence for slower oxidation rates were found for polysilicon layers lying over silicon dioxide substrate as compared to the oxidation rates of films lying directly over bare silicon. Complete oxidation of films lying over silicon dioxide substrates left scattered arsenic-silicon-oxygen inclusions trapped at the original polysilicon/silicon dioxide interface. Significant arsenic diffusion through the underlying silicon dioxide layer, into the silicon substrate, was measured after the complete oxidation of thick polysilicon films over thin silicon dioxide substrates. (17 refs.)

103350 Reactive ion etching of silicon with $Cl_2/Ar(1)$. H.B.Pogge, J.A.Bondur, P.J.Burkhardt (General Technol. Div., IBM Corp., Hopewell Junction, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1592-7 (July 1983).

A study of the use of reactive chlorine species for etching silicon and silicon dioxide in a plasma etching process has been made with a Cl_2-Ar gas mixture in a cathode-coupled diode system. A key advantage of the Cl_2-Ar gas mixture is the ability to achieve high etch rate ratios between silicon and silicon dioxide ($\geq 20:1$) coupled with no mask undercutting, which tends to be prevalent with fluorinated gas systems. Etching characteristics of Si as a function of process parameters (Cl_2 concentration, pressure, system loading) and material parameters (e.g. Si conductivity, edge shape of SiO_2 mask) have been evaluated. These parameters can influence the silicon etch rate, the Si/SiO_2 etch rate ratio, as well as the etched edge shape. (13 refs.)

103351 Chemical stress cracking of acrylic fibres. J.Herms, L.H.Peebles,Jr., D.R.Uhlmann (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).

J. Mater. Sci. (GB), vol.18, no.8, p.2517-30 (Aug. 1983).

The generation of periodic microscopic transverse cracks in oriented acrylic fibres immersed in hot alkaline hypochlorite solution is described in detail and shown to be a variety of chemical stress cracking. It is greatly accelerated by external tensile stress, high fibre permeability, moderate fibre orientation, and water-plasticization. The proposed mechanism for bond cleavage involves cyclization of nitrile groups (similar to the 'prefatory reaction' in pyrolysis of acrylic fibres), followed immediately by *N*-chlorination and chain scission. Mechanical retractile forces (internal or external) then cause chain retraction and crack growth. Despite the remarkable regularity of the crack pattern, which typically resembles a series of stacked lamellae, the process is independent of any such underlying fibre morphology. The cracking process does, however, appear to be a sensitive indicator of residual latent strain in the fibre, which may persist even after high-temperature annealing. (18 refs.)

103352 Problems of cleaning a surface and evaluation of its cleanness. Z.Rymuza (Inst. Konstrukcji Przyrzadow, Precyzyjnych i Optycznych, Politech. Warszawskiej, Warsaw, Poland).

Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.25-6 (Jan. 1983). In Polish.

Describes the techniques of cleaning a surface and methods of evaluating its cleanness as well as presenting problems and trends in the field of cleaning surfaces of elements. (8 refs.)

103353 Thermo-oxidative ageing and its effect on the network structure and fracture mode of natural rubber vulcanizates. N.M.Mathew, S.K.De (Rubber Technol. Centre, Indian Inst. of Technol., Kharagpur, India).

Polymer (GB), vol.24, no.8, p.1042-54 (Aug. 1983).

The changes in network structure and fracture mode of unfilled and filled natural rubber vulcanizates, during ageing at 100°C have been studied by chemical analyses and scanning electron microscopy. The fall in properties during ageing is caused mainly by chain scission. The increase in crosslink density during the initial periods of ageing causes an increase in modulus and tensile strength. Carbon black accelerates ageing, probably by surface catalysis. The simple network structure of efficiently vulcanized rubber results in better retention of properties during ageing. Antioxidant retards ageing. The extent of degradation of vulcanizates is reflected in the nature of the fracture surfaces. The roughness of the tensile fracture surface is affected to varying degrees depending upon the ageing resistance of the vulcanizates. However, in tear, the mode of fracture propagation is affected by ageing. (29 refs.)

103354 Molecular weight distribution effects on craze micromechanics. A.M.Donald, E.J.Kramer (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Polymer (GB), vol.24, no.8, p.1063-6 (Aug. 1983).

Quantitative transmission electron microscopy has been used to investigate the micromechanics of crazes in monodisperse and polydisperse polystyrene (PS). In the monodisperse PS, a large stress is observed at the craze tip, but this stress falls rapidly with distance behind the tip. In the polydisperse PS (or in blends in which a small percentage of monodisperse low molecular weight PS has been added to monodisperse high molecular weight PS) the stress at the craze tip is lower and falls much less rapidly with distance behind the craze tip. These changes are attributed to the effects of diluting the network of entangled high molecular weight chains with molecules that are too short to entangle. This dilution increases the molecular stress on the load bearing chains of the network, thus increasing the ease of craze fibrillation. (21 refs.)

103355 Computation of craze surface stresses in high impact polystyrene. L.Bevan (School of Mfg. Studies & Mechanical Engng., North East London Polytech., Dagenham, England).

Polym. Bull. (Germany), vol.10, no.3-4, p.187-90 (July 1983).

The finite element method is used to compute surface stresses for a craze in high impact polystyrene (HIPS) and the results are compared with those obtained using a distributed dislocation stress analysis. There is very good agreement between the stress profiles for the major portion of the craze length. The estimates differ in the craze tip region where calculated stresses are very sensitive to small changes in the displacement profile. (8 refs.)

103356 Solvent-crazing criteria. D.C.Wright, K.V.Gotham (Rubber & Plastics Res. Assoc., Shrewsbury, England).

Polym. Eng. & Sci. (USA), vol.23, no.3, p.135-9 (Feb. 1983). [received: July 1983]

Craze initiation in amorphous thermoplastics can be regarded as a transition from the safe to the unsafe state and, as such, can constitute a rational engineering design limit. A critical appraisal is made of three different criteria for initiation, which are of current interest. From this, it is concluded that the approach which is based upon the concept of inelastic strain is to be preferred to the two other criteria, which are based upon an asymptotic total strain or constant inelastic strain energy criterion. The inelastic strain criterion is not only capable of modeling high stress/strain crazing in air but also satisfies the case of low stress/strain crazing in solvents. Furthermore, it offers an accurate method of extrapolating data to long times and, thus, satisfies a fundamental requirement for a parameter that can be used in engineering design. (7 refs.)

103357 Studies on whitening phenomena induced by some non-solvents on highly oriented glassy polymers. N.H.Sung, R.E.Gahan, R.E.Haven (Dept. of Chem. Engng., Tufts Univ., Medford, MA, USA).

Polym. Eng. & Sci. (USA), vol.23, no.6, p.328-36 (April 1983).

Whitening phenomena, characterized by optically opaque regions when a highly oriented glassy polymer is immersed in some liquids, were investigated as a function of temperature, extent of molecular orientation, different solvent and molecular weight, using oriented polymethyl methacrylate (PMMA) obtained by hot-stretching and cold drawn polycarbonate (PC). Whitened PMMA is highly porous resembling foamed plastics and shows the same T_g as in unwhitened PMMA, while whitened PC is denser with much smaller pores and ehxibits melting behaviour characteristics of solvent-induced crystallinity. Whitening progresses with a sharp boundary between whitened and unwhitened layers which advanced at a constant velocity. At a given temperature, a higher extent of orientation leads to faster whitening process. Entropy correlation theory was employed to correlate the dependency of the whitening rate on orientation. In PMMA, when the molecular weight is in the same order as the average molecular weight between entanglements, the orientation and the whitening rate are both lower than higher molecular weight specimens. (16 refs.)

103358 Influence of mineral oils on polystyrene fracture. E.Paredes, A.Bustamante, L.Rivas (Centro de Quimica, Inst. Venezolano de Investigaciones Cientificas, Caracas, Venezuela).

Polym. Eng. & Sci. (USA), vol.23, no.9, p.498-502 (June 1983).

Polystyrene specimens coated with mineral oils of different viscosities were tested in tension. It was found that craze initiation and tensile fracture stresses, and also the breaking energy decreased with decreasing oil viscosity, all being lower than for specimens tested in air. Crazes formed in oil showed a lower fibril volume fraction and thicker fibrils than air crazes. The most striking difference in the fracture patterns was found in the initiation regions, where a globular morphology appears as a result of fibrils breakage at the stages of slow propagation, these globules becoming bigger with decreasing viscosity of the oil environment. Since the polymer-oil interfacial tensions are similar for the different oils, the trends in mechanical properties and craze and fracture morphologies cannot be attributed to a surface energy effect, but to plasticization because the deterioration in the polymer properties and the increasing craze fibrils thickness go along with the plasticizing ability of the oils. (15 refs.)

103359 Influence of liquid media on the strength of a composite with an aluminum matrix. M.I.Yatsenko, A.G.Vasilenko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.399-401 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.35-8 (Sept.-Oct. 1982).

The authors investigated the influence of liquid media on the anisotropy of the strength of unidirectional boroaluminium sheet in tension. It was found that the corrosion resistance of a composite with brittle fibres is in direct relationship to the direction of reinforcement and the volume content of fibres. (5 refs.)

103360 Physicomechanical properties of polytetrafluoroethylene treated in a high-frequency gas-discharge plasma. V.A.Vonsyatskii, E.A.Roter, V.A.Teterskii, A.N.Tynnyi (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.425-9 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.64-70 (Sept.-Oct. 1982).

The authors studied the mechanical properties of PTFE irradiated in high-frequency discharge plasma and VUV at different temperatures and also the electrophysical properties of PTFE irradiated in the discharge and then heat treated. The causes of strength and plasticity reduction and conductivity changes are analysed in terms of pyrolysis and radical formation using EPR. (26 refs.)

103361 Influence of water on the relaxation properties of filled elastomers. T.P.Bankovskaya, L.A.Akopyan, V.P.Nikiforov, G.M.Bartenev (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.432-4 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.73-5 (Sept.-Oct. 1982).

The results of spectrometric analysis of the relaxation processes in rubbers in a wide water temperature range (50-180°C) make it possible to draw conclusions important for practical predictions. In hot and superheated water the same relaxation processes occur in rubbers. With an increase in water temperature they are only accelerated and the relative share of the contributions of the λ- and ϕ-processes to the total mechanism decreases. Therefore, prediction of the relaxation behavior of rubbers in water at comparatively low temperatures by methods of relaxation spectrometry assumes the use of data obtained both in hot and in superheated water. This makes it possible to sharply reduce the time of the preliminary experiment in predicting the limiting times of maintenance of effectiveness of rubbers. (6 refs.)

103362 Distribution of elements according to the thickness of anodic oxide films on gallium arsenide. I.P.Sorokin, V.P.Kuznetsov, S.S.Olevskii (Moscow Inst. of Electronics, Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1170-4 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1316-20 (Oct. 1982).
The chemical composition of anodic oxide films on gallium arsenide has been investigated by Auger spectroscopy. The composition of an anodic oxide film depends on the chemical nature of the electrolyte. (27 refs.)

103363 Thermal formation of SiO_2 films over NiSi, $NiSi_2$ and $CoSi_2$ via silicide decomposition. F.M.d'Heurle (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Thin Solid Films (Switzerland), vol.105, no.3, p.285-92 (22 July 1983).
The thermal oxidation of NiSi, $NiSi_2$ and $CoSi_2$ layers on silicon substrates causes the formation of surface films of SiO_2 while the silicide layers are preserved. This is shown to occur via a mechanism of silicide decomposition followed by metal diffusion and recombination. In the disilicides, a measurable fraction of the silicon atoms diffuse together with the metal atoms. The process responsible for the uphill diffusion of the silicon atoms is thought to be similar to oxidation-enhanced diffusion. (22 refs.)

103364 A two-stage solution to the anisotropic polysilicon etching problem. N.P.Armstrong, J.Maleham (Plessey Res. (Caswell), Towcester.Ltd.,England).
Vacuum (GB), vol.33, no.5, p.291-4 (May 1983).
A 2 micron MOS process can make many demands upon dry-etching techniques. The needs of one such process are outlined, together with the search for an etchant gas suitable for the production environment in question. The observed etching characteristics of two well-known contenders, Freon 115 and CCl_4, are described, leading to the development of a useful two-stage solution helped by the real time monitoring ability of a laser interferometric endpoint detector. The final process has been utilised for pilot production over a ten-month period, and is discussed in terms of performance and applications, being capable of batch-etching with less than 0.1 μm linewidth loss per feature, and less than 100 Å underlying SiO_2 loss. (3 refs.)

103365 Role of silicon carbide in Al_2O_3-SiC-C refractories. T.Takahashi, F.Kitani, Y.Miyashita (Tech. Res. Center, Nippon Kokan K.K. Fukuyama-shi, Japan), A.Yamaguchi.
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.157-65 (1983). In Japanese.
Al_2O_3-SiC-C refractories are used in ladles for hot metal pretreatment. In the Al_2O_3-SiC-C refractories used in such treatments, the surface of SiC grains is corroded in a comb-like shape, and deposits of carbon are found in the affected section. Na_2O-Al_2O_3-SiO_2 compounds are also deposited on the surface of Al_2O_3 grains and inside the micropores. Microscopic observation is made of the refractories used and a thermodynamic study of the system SiO_2-SiC-C is carried out. (3 refs.)

103366 Laser chemical etching of conducting and semiconducting materials. T.J.Chuang (IBM Res. Lab., San Jose, CA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.45-56
The purpose of the paper is to examine the basic processes involved in the laser-enhanced chemical etching of solids. Specifically, the process of chemisorption, the reaction between the adsorbate and substrate atoms and the vaporization of product species affected by the laser radiation are discussed. It is shown that the laser method can provide important insight into the gas-surface reaction mechanisms. In addition, a number of examples are given to demonstrate the potential of the technique for applications to material processing. Some current studies on the laser-induced chemical etching of materials relevant to microelectronics are reviewed. Certain practical experimental approaches are also considered. (53 refs.)

103367 Laser-induced fluorescence diagnostics of $CF_4/O_2/H_2$ plasma etching. S.Pang, S.R.J.Brueck (Lincoln Lab., MIT, Lexington, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.161-8
Laser-induced fluorescence experiments have been carried out during $CF_4/O_2/H_2$ plasma etching of Si and SiO_2. Measurements of relative CF_2 radical concentrations as a function of RF power, frequency, pressure, and gas composition are reported. The results are correlated with etch rates of Si and SiO_2. The balance between CF_2 and F concentrations is shown to influence the etching process strongly. (20 refs.)

81.60B Metals and alloys

(inc. stress corrosion cracking; anticorrosion)

103368 Study by factorial analysis of the influence of chemical composition on the stress corrosion cracking of austenitic stainless steels. S.Faty, M.Da Cunha Belo (CNRS, Vitry-sur-Seine, France), J.-C.Dore.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1055-60 (18 April 1983). In French.
The stress corrosion cracking of austenitic stainless steels has been treated by factorial correspondence analysis. This statistical method gives a relationship between chemical characteristics and the susceptibility of the steels of the phenomenon. (7 refs.)

103369 Effect of surfactants upon corrosion inhibition of high-strength steels and aluminum alloys. M.Khobaib (Univ. Energy Systems Inc., Dayton, OH, USA), L.Quakenbush, C.T.Lynch.
Corrosion (USA), vol.39, no.7, p.253-7 (July 1983).
Research has been conducted on the corrosion inhibition of high-strength steels and aluminum alloys. Several formulations such as borate-nitrite, molybdate-nitrite, and benzoate-nitrate provide good inhibition to these alloys in ordinary tap water. However, when the concentration of chloride ions is high (as in the case of seawater), these formulations, in low concentrations, lose their effectiveness. It has been found that small additions of some surfactants improve the inhibition of borate-nitrite systems tremendously, and these combinations act as excellent inhibitors for high chloride-containing water and other aggressive media such as bilge solutions. Several sodium and barium compounds of phosphonates and sulfonates have been studied. The results of anodic and cathodic polarization and immersion tests on high-strength steels and aluminum alloys are discussed. (16 refs.)

103370 On the electrochemical behavior of anodic oxide films on tungsten in phosphate solutions. M.M.Hefny, M.S.El-Basiouny, A.S.Mogoda (Chem. Dept., Faculty of Sci., Cairo Univ., Giza, Egypt).
Corrosion (USA), vol.39, no.7, p.266-70 (July 1983).
The kinetics of chemical dissolution of tungsten anodic oxide films were investigated by capacitance and potential measurements in phosphate solutions. In these solutions, the oxide film appears to be composed of two layers. The outer layer ($\simeq$2/3 of the entire film) as revealed by potential measurements. In the absence of phosphate, the oxide dissolves with a rate proportional to the remaining thickness. From the observed rate of dissolution, the oxide film appears to be composed of two layers. The outer layer ($\sim$2/3 of the entire film) dissolves faster than the inner layer. The film formed in H_2SO_4 is more protective than that formed in HCL or H_3PO_4. (15 refs.)

103371 The influence of structure on the corrosion of glassy copper-zirconium alloys. J.C.Turn,Jr. (United State Steel Res. Lab., Monroeville, PA, USA), R.M.Latanision.
Corrosion (USA), vol.39, no.7, p.271-9 (July 1983).
Glassy alloys of $Cu_{60}Zr_{40}$ were melt spun and subsequently devitrified, yielding single phase polycrystalline material. Comparing the potentiodynamic polarization response of these structural types revealed no significant difference in ϕ_{corr}, b_a, b_c, I_{corr}, and I_o. Other alloys, $Cu_{58}Zr_{42}$ and $Cu_{55}Zr_{45}$ compared in glassy and crystal-line forms revealed that inhomogeneity, caused by precipitation of a second phase, did not alter the corrosion behavior from that of single phase $Cu_{60}Zr_{40}$. Corroded glassy surfaces were generally smooth except for scattered hemispherical features, while crystalline surfaces were generally smooth except for scattered hemispherical features, while crystalline surfaces were densely populated with these features. Corrosion of copper-zirconium alloy occurs by the selective dissolution of zirconium in the vicinity of ϕ_{corr}, whereas, at potentials noble to $-0.1\ V_{SCE}$, copper contributes to the anodic current. Above approximately $0.0\ V_{SCE}$, the alloys passivate. Results of potentiodynamic polarization studies suggest that for these alloys, unlike transition metal-metalloid glasses, devitrification does not significantly affect the corrosion kinetics of copper-zirconium alloys. (30 refs.)

103372 Intergranular corrosion of type 304 stainless steel and Alloy 600 in aqueous solutions containing SO_2. M.Da Cunha Belo, C.Bombart (CNRS, Vitry-sur-Seine, France), P.Berge.
Corrosion (USA), vol.39, no.7, p.279-84 (July 1983).
The susceptibility to intergranular corrosion of type 304 stainless steel and alloy 600 has been investigated in aqueous solutions containing SO_2. Experimental results indicate that both alloys are very susceptible to this phenomenon after sensitizing heat treatments. The rate of penetration of the intergranular attack appears to be governed by chromium depletion at grain boundaries. In the higher sensitized condition, the intergranular corrosion penetrates the entire thickness of 0.5 mm specimens exposed for a week to a solution 0.1 M SO_2 at 40C. Chloride and H_2SO_4 additions could be considerable importance, but SO_2 represents the major factor. (5 refs.)

103373 Analysis of oxide wedging during environment assisted crack growth. S.J.Hudak,Jr., R.A.Page (Dept. of Materials Sci., Southwest Res. Inst., San Antonio, TX, USA).
Corrosion (USA), vol.39, no.7, p.285-90 (July 1983).
Simple models, based on combining electrochemical and fracture mechanics concepts, have been formulated and shown to be useful in analyzing oxide wedging within cracks. These models were used in conjunction with measured oxide induced crack openings in turbine discs to conclude that oxide wedging does not significantly influence stress corrosion cracking in turbine discs containing NDE-detectable flaw sizes. The measured residual stress intensities were found to be between 10 and 20 $MPa\text{-}m^{1/2}$, these being about 20 to 30% of the applied stress intensities. The major contribution to the measured residual stress intensities was shown to be due to oxide contact remote from the crack tip. Based on the models developed, only 1 to 3 $MPa.m^{1/2}$ was applied by the oxide while the cracks were loaded during service. The contribution from oxide wedging generally becomes increasingly important as crack size decreases, thereby suggesting that it would be most significant during crack initiation and early growth of small cracks. (21 refs.)

103374 Intercrystalline corrosion of nickel. J.L.Bentata, S.Corretja, M.C.Petit (Univ. de Bordeaux I, Talence, France), M.Cid.

Mater. Chem. & Phys. (Switzerland), vol.8, no.6, p.553-62 (June 1983). In French.

The authors investigate the influence of the grain size and of the surface state of the passivation-depassivation phenomenon, for nickel in normal sulphuric acid. Up to a value of 750 mV vs. SSE, an instantaneous depassivation leads to an I(t) response which tends towards a stable value of the current, whatever the electrode structure and surface state might be. Corrosion is essentially of an intergranular type. For higher values of potential, electrode response during depassivation is quite different. Current intensity never tends towards a stable value whatever the grain size and the kind of polishing of the sample, this leads to different corrosion facets. (9 refs.)

103375 Generalised corrosion of nickel in sulphuric acid media: influence of grain size and surface preparation. J.L.Bentata, S.Corretja, M.C.Petit (Univ. de Bordeaux I, Talence, France), M.Cid.

Mater. Chem. & Phys. (Switzerland), vol.8, no.6, p.563-72 (June 1983). In French.

The influence of the grain size and of the surface state of crystallographic type corrosion of nickel in sulphuric solutions is investigated. Nickel electrodes of three different kinds are used and their active section is prepared with three different surface treatments. In all cases the I(t) response never tends towards a stable value. (7 refs.)

103376 Dynamic and static crack propagation properties of austenitic steels in dilute acidic geothermal brine. E.Fukushima, S.Kobatake, I.Arima, M.Morita (Res. & Dev. Centre, Toshiba Corp., Kawasaki, Japan).

J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.611-16 (July 1983). In Japanese.

Austenitic steels for geothermal power plants may meet with failure by stress corrosion in geothermal brines containing Cl^-. In this concern, dynamic and static crack propagation properties were investigated for austenitic steels (SUS 304 and SUS 316) in dilute acidic geothermal brine at Onikobe containing 5400 ppm of Cl^-. Experiments were made at Onikobe, and results obtained were analysed especially referring to fractographs. Dynamic crack propagation of austenitic steels except sensitized SUS 304 appeared to be that of corrosion fatigue, for the rate of crack propagation depended on the frequency. As for dynamic crack propagation of sensitized SUS 304, the rate of crack propagation increased rapidly in the region of $\Delta K_I \geq 15$ MPa.m$^{1/2}$ at a low frequency (0.002 Hz) by predominant influence of IGSCC. For sensitized SUS 304, K_{ISCC} was presumed to be about 19 MPa.m$^{1/2}$, and K_{FSCC} (the value of ΔK_I at which the influence of SCC begins to appear in dynamic crack propagation) was presumed to be about 15 MPa.m$^{1/2}$. For SUS 316, no characteristics of IGSCC were observed even in sensitized specimens. (19 refs.)

103377 Carbide-dispersion carburizing of Fe-Ni alloys containing titanium and vanadium. A.Chiba (Dept. of Metall., Faculty of Engng., Kumamoto Univ., Kumamoto, Japan), K.Yamaguchi.

J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.622-30 (July 1983). In Japanese.

Carbide-dispersed layers (CD layers) containing fine particles of TiC or V_4C_3 were formed by carburizing Fe-Ni-2%Ti and Fe-Ni-4%V alloys at temperatures between 1073 and 1273K. The microstructures and the formation rate of the CD layers and the particle size in the CD layers were investigated. A boundary between the CD layer and an unreacted region was plane and distinct in Fe-Ni-Ti alloys, but the boundary in Fe-Ni-V alloys was more irregular and less distinct. TiC particles in Fe-Ni-Ti alloys appeared to have no definite shape, but V_4C_3 particles in Fe-Ni-V alloys were massive and had the cube-cube orientation relationship with the austenite matrix; $(100)_\tau//(100)_{V4C3}$, $[010]_\tau//[010]_{V4C3}$ and $[001]_\tau//[001]_{V4C3}$. The particle size of V_4C_3 in the CD layer of Fe-Ni-V alloys increased linearly with the depth from the specimen surface, and the change in particle size with depth was more remarkable in high Ni alloys. The CD layer grew in proportion to the square root of time, and the reaction rate constant A was shown quantitatively as follows; $A=2\Delta C_C{}^\tau.D_C{}^\tau M_M/(\nu C_M{}^{(0)}.M_C)$, where $\Delta C_C{}^\tau$ is the carbon concentration difference between the specimen surface and the reaction front, $D_C{}^\tau$ is the diffusion coefficient of carbon in austenite, ν is the molar ratio of carbon to the solute (Ti or V) in the carbide MC_ν formed by carburizing, $C_M{}^{(0)}$ is the initial solute concentration (Ti or V) in the bulk alloy, and M_M and M_C are the atomic weights of solute atom and carbon atom. (15 refs.)

103378 Surface hardening or high-C steel by CO_2 laser. T.H.Kim, Y.S.Park, Y.J.Yoon, U.Kim.

J. Korean Inst. Met., vol.21, no.4, p.365-70 (April 1983). In Korean.

The hardened layer of the high-C (1%) steel with a thickness of 25 μm was obtained by the irradiation of CO_2 laser with a power density of 2×10^{15} W/cm^2 for about 0.23 second (spot size of 0.23 mm, scanning speed of 6 cm/min). When the thickness of hardened layer was compared with the temperature calculated by the conduction of heat in solid, the hardening mechanism was due to the solid-state transformation in steel. (17 refs.)

103379 Stress corrosion cracking susceptibility of SUS 304 stainless steel cathodically precharged with hydrogen. H.Uchida, K.Aburatani, K.Koterazawa, I.Yamada (Himeji Inst. of Technol., Himeji, Japan), H.Kawabe.

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.549-55 (May 1983). In Japanese.

The stress corrosion cracking (SCC) susceptibility of SUS 304 stainless steel cathodically precharged with hydrogen was investigated in boiling 35% $MgCl_2$ solution at 398K. The specimen preparation was carried out by precharging at 200 A/m^2 for 7.2 ks in the SCC test solution after 0~35% prestrained at 195K, and successively SCC tested by the constant loading method. The mechanical properties of specimens precharged with hydrogen are closely related to the hydrogen-induced phase transformation. The lattice of α'-martensite in high prestrain, in particular, is expanded and activated. In this case, the crack initiation during SCC of these specimens is controlled, consequently the SCC susceptibility shows a marked decrease. On the other hand, the SCC fracture surface morphology of specimens precharged with hydrogen depends on the distribution and form of strain-induced martensite (ϵ, α'), which contributes considerably to the susceptible path for cracking. It is considered from these results that the role of hydrogen dissolved in specimen during SCC has the effect of embrittlement and active dissolution to ϵ- and α'-martensite, respectively. (20 refs.)

103380 Oxidation of carburized Hastelloy X. D.Gan (HTGR Safety Div., Brookhaven Nat. Lab., Upton, NY, USA).

Metall. Trans. A (USA), vol.14A, no.7, p.1518-21 (July 1983).

Extensive research has been performed on many candidate alloys to study their properties in HTGR helium, and in addition to oxidation, it has been found that carburization is also a possible problem in HTGR. Carbon in the graphite core, carried out by carbon-containing impurities such as CO and CH_4, can deposit on the diffuse into metallic components and cause carburization. The possible effects of carburization on the oxidation of Hastelloy X was studied by an accelerated carburization and oxidation test. (24 refs.)

103381 The distribution of the nitride formation at the iron surface during gas nitriding. R.E.E.Pulkkinen (Dept of Mining & Metall., Helsinki Univ. of Technol., Espoo, Finland).

Prakt. Metallogr. (Germany), vol.20, no.5, p.222-31 (May 1983). In English, German.

The distribution of the $\gamma(Fe_4N)$- and $\varepsilon(Fe_{2-3}N)$-iron nitrides at the surface of unalloyed and chromium-, molybdenum-and silicon-alloyed α-iron during the first stages of gas nitriding at 507°C has been studied. Chromium alloying was observed to favour grain boundary precipitations, while silicon alloying, on the contrary, favoured quite homogeneous precipitations of the γ-iron nitride. The surface γ-iron nitrides began to grow from the grain boundaries both in molybdenum-alloyed α-iron and in unalloyed α-iron. In unalloyed α-iron the γ-nitrides was also nucleated at the surface far from the grain boundaries. It was not found that the alloying of iron affects the distribution of the ε-iron nitride at the α-iron surface. The surface condition (roughness, defects, contamination etc.) has a great effect on the distribution of iron nitrides. (13 refs.)

103382 Forming conditions and geometric variety of etch pits. II. Rectangular and triangular etch pits. Luo yang, Wang Zhen-Chin, Li Wen-Chen (Central Iron & Steel Res. Inst., Peking, China).

Prakt. Metallogr. (Germany), vol.20, no.5, p.232-44 (May 1983). In English, German.

For pt. I see ibid., vol.20, p.194-200 (1983). The forming conditions and characteristics of {100} etch pits appearing in the (hOO), (hkO) and (hkl) planes of metal with cubic lattices are discussed in detail. Based on the results, the criterions for the variety of etch pits with the same crystalline parameters are given, according to which the origin of variety of etch figures is shown to be the natural result of their forming conditions. The main parameter is the ratio of attacking speeds between the sample plane and the facets of etch pits. A graphic method for determining the reference cube and the variation of corresponding etch pits on a given (hkl) plane is proposed. (no refs.)

103383 Precipitation hardening in the carbonitrides of iron of the 'epsilon' type. M.El Hajjaji, M.Foos, H.Michel, M.Gantois (Lab. de Genie Metall. Associe au CNRS, Ecole Nat. Superieure de la Metall. et de l'Industrie des Mines de Nancy, Nancy, France).

Scr. Metall. (USA), vol.17, no.7, p.879-84 (July 1983). In French.

The composition and crystallographic structure of the thin hard case formed on, for example, Armco iron in a luminous electric discharge were examined. The carbonitride 'ϵ' layer which was formed at about 600°C on a ferritic test piece was supported by an austenitic sub-surface. The partial pressures of N_2, H_2 and CH_4 determined the configuration and composition of the hard case. A diffusion zone of nitrogen and carbon in the ferrite formed the matrix. 8 hours' treatment gave the maximum microhardness. After 32 hours annealing at 200°C a new phase $[Fe_4(C,N)\gamma]$ was detected. A carbonitride grain showed after 16 hours annealing at 200°C inclusions of the type $Fe_{16}(C,N)_2\alpha$. Interstitial minute precipitates between the two phases were observed by X-ray diffraction. (14 refs.) *R.S.*

103384 Influence of composite protection on the cyclic crack resistance of medium-carbon steel in a corrosive medium. Yu.I.Babei, I.B.Polutranko, M.N.Zima (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.382-7 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.16-22 (Sept.-Oct. 1982).

Among the effective methods of increasing the resistance of steel to mechanical corrosion fracture are inhibitor protection and impulse surface hardening. However, the mechanism of increasing the effectiveness, particularly the crack resistance, of parts and also the micromechanism of fracture of steels with simultaneous impulse hardening and inhibiting of the working medium (in the case of so-called composite protection) are not completely clear. To study this question, the authors have made tests on hot-rolled medium-carbon 45 sheet steel with a pearlite-ferritic structure (as-received condition). (6 refs.)

103385 Rules of fatigue fracture under fretting conditions. I.A.Nironovich (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.387-90 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.22-5 (Sept.-Oct. 1982).

The author investigated the rules of fatigue fracture of steel samples with press-fitted parts in relation to the properties and structural conditions of the contacting materials for the purpose of developing the optimum methods of strengthening. The results are found to well describe the kinetics of fatigue damage in fretting. (13 refs.)

103386 Influence of phosphorus impurity on the intergranular corrosion cracking of iron and iron-carbon alloys in nitrates. E.E.Glikman, Yu.V.Goryunov, I.Yu.Ledovskaya, E.V.Mindukshev, S.V.Trubin, E.K.Zenkova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.5, p.390-5 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.26-31 (Sept.-Oct. 1982).

The authors' study estabilished that the phosphorus impurity significantly strengthens the susceptibility of Fe-C alloy to intergranular corrosion cracking in 4 N NH_4NO_3. There are bases for assuming that such action of phosphorus is caused by acceleration of anodic dissolution of the grain boundaries as the result of adsorption displacement from the boundaries of the carbon impurity, which increases the resistance to intergranular corrosion cracking. In the carbon-free iron (0.003 wt.% C) phosphorus does not influence the susceptibility of the metal to corrosion cracking. The basic reason for strengthening of corrosion cracking under the influence of phosphorus is acceleration of the microcrack origin stage at the grain boundaries without a marked influence on their subcritical growth. (13 refs.)

103387 Influence of a passive film on the corrosion cracking of austenitic steel. A.V.Timoshenko, V.Yu.Vasil'ev, Yu.I.Podgornyi, Yu.G.Ozhiganov, O.F.Shevchenko.

Sov. Mater. Sci. (USA), vol.18, no.5, p.395-9 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.31-5 (Sept.-Oct. 1982).

The authors' study confirms the significant role of passivation of the surface of 45G17Yu3 steel in long tests of it in the stressed state in the sea without intermediate inspections, when cracks develop only in individual areas at the points of failure of continuity of the films of corrosion products. With periodically repeated inspections, in which the passivating layer is completely removed, the sources of anodic dissolution are delocalized as in the case of increasing the density of the polarizing alternating current. Therefore, not only in long tests in the sea but also with polarization with an alternating current the reason for origin of cracks is local anodic activation of the surface of 45G17Yu3 steel. (10 refs.)

103388 Corrosion fracture micromechanism of cast steel. A.I.Osaul, I.P.Volchok, Yu.A.Shul'te (V.Ya. Chubar' Zaporozh'e Mech. Engng. Inst., USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.402-4 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.38-41 (Sept.-Oct. 1982).
The influence of heat treatment on the corrosion fracture of 27GL steel with 0.021% sulphur was investigated. The inclusion content of the steel was found to determine the corrosion rate to a significantly greater degree than heat treatment. Therefore, with an increase in the cleanliness of steel, its corrosion resistance increases significantly. (3 refs.)

103389 Electrochemical mechanism of jump-like corrosion crack development under stress in carbon steels. L.N.Petròv, Yu.V.Stepurenko (M.V. Lomonosov Odessa Food Industry Technol. Inst., Odessa, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.404-8 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.41-5 (Sept.-Oct. 1982). (15 refs.)

103390 Influence of oxidation and gas-impregnation process on the mechanical properties of VT1-0 and VT14 titanium alloys. G.G.Maksimovich, V.N.Fedirko, A.T.Lizun, L.A.Bunin (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.422-4 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.61-4 (Sept.-Oct. 1982).
Results are presented of investigations which provide a basis for concluding that gas-impregnated layers with a thickness of more than 10 μm promote an increase in the strength characteristics of VT1-0 and VT14 titanium alloys and the higher the microhardness of the gas-impregnated layer, the greater the increase. (6 refs.)

103391 KhOSP inhibitors for protection of steel from corrosion, hydrogen absorption, and mechanical corrosion fracture in acid media. A.K.Mindyuk, O.P.Savitskaya, N.A.Kravchuk, A.D.Tkach (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.435-9 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.76-80 (Sept.-Oct. 1982).
The authors present the results of investigations of the protective capacity of KhOSP-10, KhOSP-A, KhOSP-N, and also KI-1, KPI-3, I-1-V, PB-5, S-5, ChM(r), KS, PKU-K, PKU-M, and other inhibitors in retarding corrosion, hydrogen impregnation, and mechanical corrosion fracture of steel in solutions of sulfuric, hydrochloric, and phosphoric acids. (10 refs.)

103392 Influence of inhibitors on the corrosion fatigue of steel in hydrogen-sulfide-containing media. E.S.Ivanov, V.P.Zavadskaya, M.D.Getmanskii (V.I. Lenin Moscow Pedagogical Inst., Moscow, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.443-5 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.83-5 (Sept.-Oct. 1982).
The purpose of the authors' investigation was a study of the influence of two-phase heterogeneous media on the cyclic strength of steel and the possibilities of protection from this form of fracture with the use of corrosion inhibitors. (3 refs.)

103393 Optimizing the method of cathodic protection of austenitic steels. A.G.Zaluzhnyi, D.M.Skorov, A.G.Zholnin, V.B.Tarasyuk, T.A.Krasina (Moscow Engng. Phys. Inst., Moscow, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.445-8 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.85-8 (Sept.-Oct. 1982).
The authors show that in electrolytic hydrogen impregnation of type 03Kh16N15M3B austenitic steels, in order to eliminate the appearance in samples of irreversible defects, impregnation should be done at increased electrolyte temperatures and with low ionic current densities (100 A/m^2 and lower). (11 refs.)

103394 Influence of diffusion impregnation in polymer-containing compositions on the physicomechanical properties of steels. T.P.Seroshtan, A.I.Soshko (Lenin Komsomol L'vov Polytech. Inst., L'vov, Ukrainian SSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.453-4 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.91-2 (Sept.-Oct. 1982).
Wear resistance investigations of steels have shown that the diffusion layers have a structure and properties close to those which are created in their treatment in polymer-containing production media. Chemicothermal treatment in polymer-containing compositions significantly accelerated the hardening process and made it possible to obtain cases with high physicomechanical characteristics. (3 refs.)

103395 Role of iron sulfide in the formation of solidification cracks in welding of electrical steel. G.F.Deev, V.V.Popovich, V.N.Palash, V.V.Karikh (Lipetsk Polytech. Inst., Lipetsk, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.458-60 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.96-8 (Sept.-Oct. 1982).
An investigation was made of the influence of FeS on the formation of solidification cracks in tungsten arc welding of type E412 electrical steel. It was found that the reduction in ductility in molten FeS was caused to a significant degree by its corrosion action on the metal. (4 refs.)

103396 Influence of an oxide film on the anodic anionic activation of metals. A.D.Davydov, A.N.Kamkin, O.V.Zemskova (Inst. of Electrochem., Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1216-20 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1367-72 (Oct. 1982).
An investigation was made of the influence of a preliminarily grown anodic oxide film on iron, zirconium, and titanium on the potential of anodic activation of these metals in chloride solutions. Local nonuniformity of the anodic oxide film with respect to their protective capacity against the aggressive action of chloride was demonstrated. One of the necessary conditions of the beginning of anodic activation of titanium is a critical increase in the imperfection of the anodic oxide film (cracking, porosity) when it thickens. (30 refs.)

103397 Chromium passivity. Effect of potential and pH on passive film thickness. M.N.Shlepakov, A.M.Sukhotin, Yu.P.Kostikov, V.S.Strykanov (M.I. Kalinin Leningrad Polytech. Inst., Leningrad, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1276-8 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1430-2 (Oct. 1982).
The authors used ESCA spectra to support prior evidence that the passive fim on Cr in acid solutions is basically Cr_2O_3. (10 refs.)

103398 Chromium passivity. Presence of Cr(VI) in the passive film. M.N.Shlepakov, A.M.Sukhotin, Yu.P.Kostikov.
Sov. Electrochem. (USA), vol.18, no.10, p.1279-81 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1433-4 (Oct. 1982).
ESCA spectra have been presented which show that the passive film on Cr in acid solutions is G_2O_3. In addition to the spectral lines for both this compound and Cr metal, the authors also found peaks with binding energies of 579 eV at all potentials in the passive region. The nature of such peaks is studied using passive Cr anodes in H_2SO_4 solution. (7 refs.)

103399 Corrosion behaviour of 18-8 austenitic stainless steel in NaOH solutions and the effect of chloride ions. S.S.Abd El Rehim, S.M.Abd El Haleem, S.M.Abd-El Wahaab, M.S.Shalaby (Chem. Dept., Faculty of Sci., Ain Shams Univ., Cairo, Egypt).
Surf. Technol. (Switzerland), vol.19, no.3, p.261-71 (July 1983).
The corrosion behaviour of commercial Egyptian 18-8 austenitic stainless steel was investigated in NaOH solutions of various concentrations between 1×10^{-3} and 2.5 M. The results indicate that the current densities, corresponding to the active, passive and transpassive regions increase with increases in the concentration of the electrolyte, whereas the corrosion potential varies with the NaOH concentration according to $E_{corr}=a-b \log C_{NaOH}$. The relation between the potentiodynamic sweep rate and the maximum dissolution current density was found to be $\log v=a+b \log j$. It was concluded that the corrosion potential depends on both the alkali and the chloride ion concentrations. (20 refs.)

103400 The solid-state reaction of copper and tin: an assessment of the value of an iron barrier layer. B.C.Scott, M.E.Warwick (Internat. Tin Res. Inst., Greenford, England).
Trans. Inst. Met. Finish. (GB), vol.61, pt.2, p.43-5 (Summer 1983).
The solid state diffusion of copper and tin to produce intermetallic compounds at the interface between a coating of tin on copper or brass may be severely restricted by the use of a barrier layer of electroplated iron. Ultimately the barrier fails by rupturing due to the growth of copper/tin intermetallic compounds at pores in the iron layer. (13 refs.)

103401 The fatigue properties of mild steel with surface diffusion coatings of nickel-iron and nickel-cobalt-iron alloys. G.M.C.Lee (Dept. of Mech. Engng., Univ. of Edinburgh, Edinburgh, Scotland), W.J.D.Jones.
Trans. Inst. Met. Finish. (GB), vol.61, pt.2, p.50-6 (Summer 1983).
Nickel and nickel-cobalt alloys were electroplated onto mild steel and then diffused into the surface layer of the steel by heating at 970°C or 1010°C for periods of up to 50 hours. The diffusion coated steels were then fatigue tested in air. All the diffusion alloyed specimens showed an improvement in fatigue properties compared with similarly heat treated but uncoated steel. The maximum improvement in fatigue limit stress was 27%. (8 refs.)

103402 Atmospheric oxidation of chromium between 270 and 490°C. K.Shanker, P.H.Holloway (Dept. of Materials Sci. Engng., Univ. of Florida, Gainesville, FL, USA).
Thin Solid Films (Switzerland), vol.105, no.4, p.293-303 (29 July 1983).
Auger electron spectroscopy was used to study the oxidation behaviour of pure chromium in the temperature range 270-490°C for exposures ranging from 1 h to more than 100 h in air. Regression analysis indicated that the oxide thickness on mechanically polished bulk chromium samples increased logarithmically with time, although some spallation was observed at the highest temperature. Oxidation of mechanically polished samples was slower than that for electropolished bulk chromium or that for chromium films on glass substrates. Possible factors responsible for the slower logarithmic growth rate of the oxide on the mechanically polished samples are discussed. (25 refs.)

103403 Planar plasma etching of chromium. H.M.Naguib, R.A.Bond, H.J.Poley (Bell-Northern Res., Ottawa, Ontario, Canada).
Vacuum (GB), vol.33, no.5, p.285-90 (May 1983).
The plasma etching characteristics of chromium thin films in an RF planar (parallel plate) reactor were investigated. The experimental work was performed using a commercial reactor operating at 13.56 MHz with power variable up to 500 W. The etch rate of the Cr films deposited on glass substrates by e-beam evaporation was measured as a function of the concentration of O_2 in a CCl_4/O_2 gas mixture, the total flow rate of input gases and the RF power density. Using a total gas flow of 15 sccm and an input power density of 0.4 W cm^{-2}, the maximum etch rate was obtained in CCl_4 plasma containing 40% O_2. It was found that doubling the number of the substrates in the reactor decreased the etch rate by 20%. Also, the etch rate at the back of the reactor was twice that at the front. Methods to alleviate nonuniformity and loading effects are discussed and the mechanism of plasma etching of Cr is examined through the effect of various processing parameters on the etching characteristics. (31 refs.)

103404 Changes in the chemical reactivity of metals exposed to an inert gas glow discharge. D.F.Klemperer, D.J.Williams (Dept. of Phys. Chem., Univ. of Bristol, Bristol, England).
Vacuum (GB), vol.33, no.5, p.301-5 (May 1983).
From time to time the literature mentions curious effects on the chemical reactivity of metals due to inert gas ion bombardment: reactivity in corrosive environments is variously said to be inhibited or enhanced. Although there is no obvious explanation for such effects, some possible mechanisms have been suggested. A few simple experiments have been carried out designed to demonstrate that reactivity effects really do exist and to test such mechanisms as have been proposed. The results are qualitative because a glow discharge was used to implant the rare gas ions. Evaporated films of aluminium and nickel become amorphous after bombardment with xenon ions and the films resisted gaseous and liquid corrosion. On the other hand, aluminium foil bombarded with xenon ions in a Penning pump arrangement was attacked more heavily than unbombarded aluminium. Passivation was attributed to the known lack of reactivity of amorphous metals. Glassy materials appear to lack the normal routes of attack between their subsurface regions and the attacking medium. On the other hand, when a metal surface is heavily ion bombarded the surface is probably damaged to such an extent that the attacking medium gains physical access to the interior and corrosion proceeds rapidly. (32 refs.)

103405 Plasma arc coatings combat component wear. J.L.Desir (Eutectic+Castolin Inst., Lausanne, Switzerland).
Weld. & Met. Fabr. (GB), p.219-22 (June 1983).
There is an increasing demand for reliable and low maintenance industrial machinery. One way of protecting original components against abrasive and corrosive wear and of repairing damaged parts is plasma surfacing. There are two plasma processes: Transferred arc process: an arc is struck between a heat-resistant cathode in the torch and the workpiece which forms the anode. The arc is constricted by a second anode in the torch. Non-transferred arc process: an arc is struck between a cathode and a nozzle-type anode in the torch. Gases, expelled at high speeds through the nozzle, are raised to high temperatures and projected onto the workpiece. Examples of application of these are presented. (no refs.)

103406 Laser-pulsed plasma chemistry: surface oxidation of niobium. R.F.Marks, R.A.Pollak, P.Avouris (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.257-64
Laser irradiation of a solid surface under an oxidizing ambient gas can activate localized, heterogeneous chemical reactions which modify the surface. Under suitable conditions, the laser initiates a reactive plasma near the gas/solid interface. This plasma mechanism is proposed as the basis for a new

surface chemical technique which the authors denote as laser-pulsed plasma chemistry (LPPC). LPPC experiments on niobium metal under one atmosphere of oxygen employed a pulsed CO_2 laser and displayed single-pulse, self-limiting, oxide growth. Product oxide thickness increased with optical intensity. Surface layer thickness and chemical composition were determined for oxide layers between 1 nm and 5 nm thick using X-ray photoelectron spectroscopy (XPS or ESCA). Composition of these niobium oxide ($Nb_2O_{5-\delta}$) surfaces was similar to the composition produced by RF plasma oxidation, but the valance defect, δ, for LPPC oxides was approximately two to five times lower. At high laser intensity ($\gtrsim 4\times10^6$ W/cm^2), direct optical heating or plasma-mediated thermal coupling to the solid activates interdiffusion at the oxide/metal interface. (23 refs.)

103407 Formation of CdO and Cu_2O films by laser irradiation of the corresponding metallic films in air. R.Andrew, L.Baufay, A.Pigeolet, M.Wautelet (Univ. de l'Etat, Mons, Belgium).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.283-9
Describes the oxidation of 1000 Å thick metal films on glass substrates when exposed to a scanning laser beam. For Cd and Cu films optical spectroscopy shows an energy gap of 2.45 eV and 2 eV respectively, in agreement with published data for CdO and Cu_2O. The authors measure the power threshold for complete oxidation in a single scan and deduce the maximum temperature, which is inconsistent with thermal oxidation data but corresponds to the m.p. of the metals. They point out the important contribution of the heat of formation to the temperature balance and demonstrate that in the case of Al this effect is sufficient to destroy any oxide formed. (10 refs.)

81.70 MATERIALS TESTING

(inc. sample preparation for examination, metallographic techniques, ion and electron microprobe techniques, Auger and photoelectron techniques, defectoscopy; for measurement in the mechanics of solids and rheology, see 46.30R)

103408 Ill-posed and well-posed problems in inverse elastodynamic scattering for nondestructive evaluation. D.A.Lee (USAF Inst. of Technol., Wright Patterson AFB, Dayton, OH, USA).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.161-72 (Dec. 1981).
The practical significance of ill-posedness in a data reduction problem is reviewed. Inverse elastodynamic scattering is shown to be ill-posed in general, although suitably restricted problems may be well-posed. These results underscore the need to analyze carefully the errors of data reduction problems in NDE, and to focus attention on final results of an NDE exercise, rather than on intermediate steps. (11 refs.)

103409 Computerized evaluation of acoustic images utilizing a method of averaging. G.C.Knollman, D.L.Hitzl, R.E.Bollinger (Lockheed Res. Lab., Palo Alto, CA, USA).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.173-88 (Dec. 1981).
A computerized technique is presented which has been developed for analyzing acoustic images of an inhomogeneous material. The acoustic imaging system is briefly described with emphasis on its adaptation to billets of graphite for atmospheric reentry body use. Ultrasonic images of such inhomogeneous material contain a nonuniform distribution of anomalies and few, if any, geometrically regular features which can be assessed to establish material integrity. Results obtained with the new algorithms show, for certain discriminants, a high degree of correlation between the numerical accept/reject values obtained from acoustic image processing and the time-to-failure of the graphitic material in simulated atmospheric reentry tests. (14 refs.)

103410 Treatment of false calls in evaluating nondestructive inspection proficiency. H.Sharp,Jr., W.H.Sproat.
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.189-94 (Dec. 1981).
A test designed to evaluate nondestructive flaw detection proficiency by ultrasonic and eddy current methods has been conducted. Test data for each participant are reduced to contingency table format, and analysis of these tables via traditional measures of association is used to rank individual performances. The presence of false calls in an inspection record introduces a random inflation in flaw detection results. Measures are required which compensate for that fact. Proficiency rankings based on two such measures, Somer's *d* coefficient and the mean square contingency coefficient, show reasonable consistency with intuition-based rankings by experienced observers. Finally, a weighted generalization of Somers's *d* is suggested, although optimal selection of weights remains an open problem. (6 refs.)

103411 Parasitic voltages induced by artificial flaws when measured using the AC field technique. D.Mirshekar-Syahkal (Dept. of Mech. Engng., Univ. Coll., London, England), D.H.Michael, R.Collins.
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.195-202 (Dec. 1981).
The development of a successful and accurate instrument for measuring surface-breaking cracks in metals using the AC field technique has raised several interesting theoretical problems. Measurements with the instrument, known as the Crack Microgauge, do not rely on any prior calibration against an artificial flaw such as a saw-cut in a test block, but some users accustomed to such a calibration from other devices have nevertheless wished to use the instrument in that fashion and have in some instances reported erroneous results. A simple theory was developed to explain and quantify this phenomenon. The parasitic voltages induced in the instrument probe due to the finite opening possessed by an artificial flaw are calculated and the results used to reinterpret the instrument readings. Controlled experimental measurements on artificial flaws of rectangular cross-section made in aluminum and in steel are found to be in good agreement with the theory. It is shown, however, that application of the theory requires additional information about the internal phase shift associated with the instrument. (7 refs.)

103412 Propagation of elastic waves in honeycomb panels for application to rapid inspection techniques. H.L.Bertoni, S.K.Park (Dept. of Electrical Engng. & Computer Sci., Polytech. Inst. of New York, Brooklyn, NY, USA).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.209-17 (Dec. 1981).
Considers the properties of elastic waves guided by an aluminum plate bonded to a honeycomb core for application to rapid inspection of honeycomb panels. Current acoustic inspection techniques involve the transmission of a signal between a pair of small transducers located on opposite sides of the panel. Scanning the transducers in raster fashion results in a high resolution inspection of the panel, but is very time consuming. An alternative technique would simultaneously inspect all points along a line between two widely spaced transducers located on the same side of the panel. Scanning the pair once over the panel permits rapid inspection, although the decreased resolution. Studies presented here indicate that such a method of inspection is feasible and that the flexural mode is probably the most useful. (6 refs.)

103413 Surface acoustic wave measurements of surface cracks in ceramics. J.J.W.Tien, B.T.Khuri-Yakub, G.S.Kino (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.219-29 (Dec. 1981).
An investigation of scattering from surface cracks has been conducted. In particular, the change in the reflection coefficient of a Rayleigh wave incident on a surface indentation crack has been measured as the sample is stressed to fracture. The acoustic measurements have been correlated with the stable crack extension that precedes final failure. The crack extension behavior of as-indented specimens was found to differ appreciably from that of annealed specimens. Cracks in the annealed samples exhibited partial crack tip closure, but little stable extension, whereas cracks in the as-indented samples, displayed both crack closure and irreversible crack growth. This behavior has been rationalized by invoking concepts based upon the residual stresses created by indentation. (18 refs.)

103414 Application of metal single crystal wedges to high frequency Rayleigh wave propagation. E.S.Fisher (Argonne Nat. Lab., Argonne, IL, USA), D.Zwick, D.VanHook, G.Henkleman, B.Smith.
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.231-9 (Dec. 1981).
Techniques for propagating Rayleigh waves with frequencies varying from <1 to 270 MHz were developed for the purpose of nondestructive evaluation of composition or defect gradients near the surface of nonpiezoelectric solids. The surface waves with frequencies greater than 15 MHz were obtained from a novel technique using single crystal wedges, whereas the low frequency waves were produced by a previously used high voltage impulse. Measurements of Rayleigh wave velocities on single crystals of Ge and Al were performed as a test of accuracy and precision and are compared with calculated values. (11 refs.)

103415 Particle-size effects in non-destructive material assay by gamma-ray absorptiometry. I. Theoretical model. H.L.The, W.Michaelis, H.-U.Fanger (Inst. fur Phys., GKSS Forschungszentrum Geesthacht, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.445-61 (1 July 1983).
Gamma-ray absorptiometry has become a widely used method in non-destructive material assay. The procedure implicitly presumes a homogeneous, fine-grained distribution of the solid components of the material and is well described by a 'sandwich' model. However, due to the nonlinearity of the attenuation law, systematic errors arise if finite grain sizes are involved. The present paper deals with the influence of particle size and gives a thorough theoretical treatment of these effects, which allows the extension of the method to mixtures containing one or even several coarse-grained constituents. The derivation of suitable generalized transmission equations requires the construction of a particle-size dependent attenuation law. This is achieved by means of a 'cell' model which subdivides the irradiated volume into smallest possible 'cells' with representative parts by volume of the material components. Correction functions are deduced that can be used to take into account particle-size effects by properly modifying one of the relevant physical quantities in the conventional transmission equations. The properties of these functions are discussed with respect to their applicability in practice. (12 refs.)

103416 Thermal contact under a diamond indenter. R.Danell, H.J.Goldsmid (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.413-14 (Aug. 1983).
The authors have determined the apparent region of contact by measuring the thermal resistance between a conical diamond indenter and samples of steel and gold under a range of loads. All the experiments were performed at temperatures of about 40°C. (2 refs.)

103417 Determination of the behaviour of composite materials under dynamic conditions. A.Cardon (Vrije Univ. Brussel, Brussels, Belgium), C.Hiel.
Cah. Groupe Fr. Rheol. (France), vol.5, no.6, p.283-91 (Feb. 1982). In French. [received: July 1983]
Commercially available equipment (IMASS and METRAVIB), connected with an active interface to a minicomputer HP 1000, permits one to measure the components of the complex modulus of composite materials. The measurements were obtained in a frequency range 0.1 to 10 Hz ($\rightarrow$1000 Hz) and a temperature range from 25 to 200°C. The method is a macro- and micromechanical approach and needs the measure of only one viscoelastic characteristic. The experimental control results agree with the calculated data. (9 refs.)

103418 An autoradiographic technique for studying the segregation of hydrogen absorbed into carbon and low alloy steels. D.Le.Tuyen, B.E.Wilde (US Steel Corp., Res. Lab., Monroeville, PA, USA).
Corrosion (USA), vol.39, no.7, p.258-65 (July 1983).
The technique described preserves the microstructural features of the easily corroded carbon and low alloy steel without the need for protective films by inhibiting the photographic processing solutions with sodium nitrite. Tritium segregation can then be directly related to the microstructural features of a metallographically polished and etched specimen by observing the resulting silver clusters with a scanning electron microscope, equipped with automatic image analysis up to magnifications of 10^4 diameter. Examples are presented by using a quenched and tempered casing steel showing tritium segregation

to: (1) manganese-sulfide inclusions, (2) glassy silicate particles, and (3) flobular aluminum oxide inclusions. (18 refs.)

103419 A novel corrosion monitor based on the Faradaic rectification technique. J.S.Gill, L.M.Callow, G.A.M.Sussex, J.D.Scantlebury (Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Corrosion (USA), vol.39, no.7, p.293 (July 1983).
Presents a simplified circuit for a corrosion monitor previously described by the authors (see ibid., vol.39, p.61, 1983). (2 refs.)

103420 Thermographic technique for the nondestructive evaluation of graphite composite structures. C.W.Souder, G.E.Singleton (Northrop Res. & Technol. Center, One Research Park, Palos Verdes Peninsula, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.80-7 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
The extensive use of advanced composite materials on aircraft has increased the need for improved inspection techniques. Presently, graphite composite structures for high performance military aircraft require extensive ultrasonic and X-ray inspection for the detection of porosity, delaminations and disbonds. Thermographic inspection offers the potential for a lower cost alternative to these techniques. Much of the work on the application of thermographic techniques as an alternative to the above means of inspection has been qualitative and limited to laboratory use. The transient thermal response of graphite composite structures has been shown to be useful in detecting porosity, delamination and disbonds, and the use of image processing simplifies operator interpretation of the resulting data. The authors describe further research on this subject and propose systems for production use and field inspection of advanced composite structures. (3 refs.)

103421 Investigation of the formation of flaking in steel using the acoustic emission method. V.O.Gol'tsov, M.O.Ishchenko, A.D.Slabolits'ka.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.71-4 (1983). In Ukrainian.
The amplitude distribution of acoustic emission (AE) is studied during flaking in the hydrogen-charged steel. The maximum of the AE amplitude distribution shifts to higher amplitudes as the level of internal stresses in steel increases. The best correlation is stated between the total number of impulses of the AE events and the acoustic emission integral parameter, on the one hand, and the total length of flakes on a macrosection (i.e. their total surface in the metal body), on the other hand. (5 refs.)

103422 Reflected-light microscopy for examining hard ferrites with the Amplival pol.u microscope. G.Sansoni (Res. Inst. for Ore Dressing, Acad. of Sci., Freiberg, Germany).
Jena Rev. (Germany), vol.28, no.2, p.72, 75 (1983).
Hard ferrites are oxide-ceramic substances which, on account of their permanent-magnetic properties and their low-cost production, are increasingly used in electronics and electrical engineering. The author's endeavours aim at opening up further fields of application of this oxide ceramic by the substitution of metal magnets. After a grinding time of about 6 hours, the preparations contain 2 to 30 grain percents above the one-domain grain size. This fact suggests checking once more the possibilities held out by light-microscopic methods for this specific application. The best results were obtained in this case by bright-field incident-light microscopy, using the Amplival pol.u microscope of VEB Carl Zeiss Jena. (9 refs.)

103423 The examination of grain collectives with the aid of microscopes. M.Mohr (VEB Kombinat KALI, Sondershausen, Germany).
Jena Rev. (Germany), vol.28, no.2, p.73-5 (1983).
Deals with examination methods on structural-morphological phenomena such as intergrowth, agglomeration, shape and size of grains etc. The instruments employed for this purpose are polarizing microscopes of the type Amplival pol, a Technival stereomicroscope for incident-light examinations and the mf photomicrographic equipment. (5 refs.)

103424 Possibilities and limits of the interference microscopic phase analysis. H.-H.Seyfarth, U.Fickel, H.Keune, J.Bergner (Teachers Training Coll. 'Dr Theodor Neubauer', Erfurt/Muhlhausen, Germany).
Jena Rev. (Germany), vol.28, no.2, p.76-7 (1983).
For the phase analysis of solid aggregates with grain sizes between 1 and 40 μm, polarization-microscopic measuring methods may be employed to advantage. The most important quantity is the refractive index. Advances made in interference microscopy made the authors hope that, when using linearly-polarized light, methodical possibilities would be found to determine the n_α' and n_γ' values with but one embedding medium for each grain. Thus, the path would be open for statistical determination of the principal refractive indices in a grain collective and also in those chemical solids, which may be preserved only in specific embedding media. To test the method, the refractive indices were determined by measuring, interferometrically, the path difference R between specimen and embedding medium in the Amplival pol interphako research microscope. (no refs.)

103425 Non-destructive testing and acoustic microscopy of diffusion bonds. B.Derby (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England), G.A.D.Briggs, E.R.Wallach.
J. Mater. Sci. (GB), vol.18, no.8, p.2345-53 (Aug. 1983).
Despite successful applications of diffusion bonding, there is a lack of good quality assessment methods. A survey of published results shows non-destructive testing techniques (NDT) developed for fusion welds to be ineffective in indentifying the much smaller defects found in diffusion bonds. An investigation into the possibilities of using electrical resistance measurements for NDT shows the requirement of equipment with a very high stability and sensitivity. Finally the use of very high frequency ultrasonic sound in an acoustic microscope is considered as a method of defect investigations. This acoustic microscopy proved to be a highly encouraging new line of investigation for the examination of diffusion bonds. (14 refs.)

103426 The potential drop across an imperfect diffusion bond. K.W.Lodge, G.A.D.Briggs (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2354-60 (Aug. 1983).
In the non-destructive evaluation of diffusion bonds, a possible technique is to measure the potential drop for a given current flow. Using evidence from optical and acoustic microscopy, the geometrical details on an incomplete diffusion bond are represented by an idealized mathematical approximation. This is solved exactly using conformal mapping by a Schwarz transformation. The result for the change in resistance as a function of bond development is given as an analytic expression. (5 refs.)

103427 Acoustic emission from graphite/epoxy composite laminates with special reference to delamination. L.Carlsson, B.Norrbom (Aeronautical Res. Inst. of Sweden, Bromma, Sweden).
J. Mater. Sci. (GB), vol.18, no.8, p.2503-9 (Aug. 1983).
Acoustic emission (AE) techniques were used for the detection of progressive damage in graphite/epoxy composite laminates. The AE signals were monitored during the uniaxial loading of symmetrical eight-ply laminates with three different stacking sequences. The peak value and the weighted cumulative count were determined as a function of applied axial stress. Both the peak value data and the cumulative count data are characterized by a pronounced increase at first-ply failure as determined by the Tsai-Hill anisotropic strength criterion, followed by a continuous emission until delamination or final fracture occurs. At the onset of delamination, a pronounced deflection was noted in the accumulated AE signal. Plastic deformation of the matrix generated no significant AE. (15 refs.)

103428 Some optical techniques of displacement and strain measurements on metal surfaces. F.P.Chiang (State Univ. of New York, Stony Brook, NY, USA), C.C.Kin.
J. Met. (USA), vol.35, no.5, p.49-54 (May 1983).
Discusses the use of in-plane moire, shadow (or projection) moire, and laser speckle techniques of displacement and strain measurements on metal surfaces. Both in-plane and out-of-plane deformation can be obtained. Examples include elastic and plastic deformations and metal forming problems. (13 refs.)

103429 Simulation model of acoustic emission due to microscopic fracture in metals. T.Ohira (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan), T.Kishi.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.575-81 (July 1983). In Japanese.
A simulation of acoustic emission signals due to fracture events was carried out in order to investigate the temporal inhomogeneity of fracture processes. In the simulation process, two types of source function $D(t)$, the product of crack volume-time history and elastic modules, were assumed, and output signals from piezoelectric transducer $V(t)$ were calculated from the convolution of $D(t)$ with $R(t)$, which is a combined response function of specimen and transducer obtained experimentally by the use of breaking pencil lead. It was shown that the amplitude of $V(t)$ was proportional to the crack volume and the longer the lifetime of cracking, the smaller the amplitude. From these results, it was proved that only the fracture events with large cracking volume and short lifetime were detectable as an acoustic emission and that burst type emissions during macroscopic subcritical crack growth were attributed to the instantaneous fast fracture in the microscopic sense. (19 refs.)

103430 Non-destructive detection of creep damage for Cr-Mo-V steel forgings. T.Goto (Takasago Tech. Inst., Mitsubishi Heavy Industries Ltd., Takasago, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.563-9 (May 1983). In Japanese.
In order to develop a non-destructive method to detect the creep damage and estimate the residual life for the machine parts used at high temperatures, the changes in material properties caused by long-term heating and by creep were observed with the test methods of X-ray diffraction, eddy current, and hardness. The material tested was tempered Cr-Mo-V steel. Hardness test was found the most suitable method to detect the material property change for Cr-Mo-V steel. The change in hardness during long-term heating was expressible by a simple curve in the plotting against the Larson-Miller parameter. Softening was caused by heating above a certain temperature but below the temper temperature. The softening was accelerated by the stress larger than 11 kg/mm^2. The change in hardness during creep under the stress of σ (kg/mm^2) was correlated with those of long-term heating. (12 refs.)

103431 Radiation pattern of acoustic emission. M.Ohtsu (Faculty of Engng., Kumamoto Univ., Kumamoto, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.577-83 (May 1983). In Japanese.
Fundamental studies in regard to radiation patterns of AE wave motions are reported. Such patterns are verified in the experiments. In the source location experiments, the types of sources can be classified into two groups from AE characteristics based on the radiation pattern. They are associated with tensile cracks and others. From the relation between the radiation pattern and the dislocation model, in addition, the orientations of dislocation models may be determined. The improved source location technique is developed and applied in the experiments. The results show that the determination of source kinematics by the aid of the radiation pattern is promising in concrete. (8 refs.)

103432 On the preparation of specimens from multifilamentary Nb_3Sn superconducting wires for transmission electron microscopy. Y.S.Hascicek, S.Nourbakhsh, M.J.Goringe (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
J. Microsc. (GB), vol.131, pt.1, p.55-61 (July 1983).
A set of techniques for preparing transmission electron microscope specimens from sections of thin (≲1 mm overall diameter) multifilamentary wires (filaments being approximately 5 μm diameter) are described. Results illustrating the successful uniform thinning of the several phases present in 'bronze-route' Nb_3Sn are shown. (11 refs.)

103433 Echo response of crack-like reflectors in focused ultrasound fields. II. F.Walte, W.Muller.
Mater. Test. (Germany), vol.25, no.7, p.235-7 (July 1983). In German.
Curves representing half-value amplitudes and spacings are given for echo signals as a function of crack angle for both medium and strongly focused ultrasonic fields. The edge distortion effect is shown to produce amplitude/angle response curves within a trapezium-shaped envelope. In a particular example, signal response curves are given for the ultrasonic edge pressure P(k) in dB, as a function of the angle for each of three field focusing radii (R) of 22 mm., 47 mm., and infinity, representing strong focus, moderate focus and a plane oscillator, respectively. *G.C.*

103434 Separation and symmetrizing of K-alpha doublets using a computer when measuring stresses by X-rays. V.Hauk, W.K.Krug.
Mater. Test. (Germany), vol.25, no.7, p.241-3 (July 1983). In German.
The K-alpha interference spectra between the alpha-1 and alpha-2 lines are given for single slot X-radiation for material in four different conditions, (1), iron powder, (2) steel 54 Ni Cr Mo V 6 heat treated in an Argon atmosphere for 2 hours at 700°C, (3) as (2) at 500°C, and (4) as (2) untreated. Curves are also illustrated for material (3) for single and double slot radiation and for the separation and symmetrization conditions as derived from a computer analysis of the intensities. The characteristic features of different methods of interference evaluation are discussed. (5 refs.) *G.C.*

103435 Development of methods of nondestructive quality control for ferrofluids. D.V.Orlov, Yu.A.Mit'kin, N.I.Dyupovkin.
Magnetohydrodynamics (USA), vol.18, no.4, p.429-32 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.113-16 (Oct.-Dec. 1982).
The authors present the results of studies pertaining to the electrical characteristics of various ferrofluids on silicone base in a magnetic field. For the study of electrical volume resistivity, electric strength, dielectric permittivity, and dielectric loss tangent, ferrofluids with various degrees of stability were used. (9 refs.)

103436 Flaw classification by a spectral division of ultrasonic echoes. H.Seiger, J.Wagner (Krautkramer GmbH, Koln, Germany).
NDT Int. (GB), vol.16, no.4, p.195-200 (Aug. 1983).
An ultrasonic method to differentiate between isolated flat and voluminous flaws (flaw classifying) is described. The technique, developed using artificial reflectors, uses a form of frequency spectrum analysis in which the spectrum is divided into bands. Knowing the positional dependence of only a few data obtained from the amplitude spectrum of the echo, a value can be calculated which lies in an interval that is characteristic of a particular type of flaw. The method was tested on 29 natural weld flaws, and results support the feasibility of the technique. (4 refs.)

103437 A Fourier transform technique that measures phase delays between ultrasonic impulses with sufficient accuracy to determine residual stresses in metals. D.R.Allen, W.H.B.Cooper (Materials Phys. Div., AERE Harwell, Didcot, England).
NDT Int. (GB), vol.16, no.4, p.205-17 (Aug. 1983).
A Fourier transform technique is described which measures phase delay using short duration pulses or impulses. The method of data analysis is detailed and some simple test functions are used to estimate the accuracy and reliability of the resulting phase delays. It appears that the inherent accuracy associated with this technique is not much different from that of a zero cross-over technique using a chopped CW source and narrowband receiver. Measurements of ultrasonic phase delays for a 50 mm thick mild steel plate using the Fourier transform technique are given for compressional and shear waves with frequencies around 2 MHz and 5 MHz. Both EMA and piezoelectric transducers have been used. Corresponding measurements of phase delay using a chopped CW stimulus are shown to be in good agreement. (6 refs.)

103438 Location and estimation of the defective area in a diaphragm: an a posteriori moire method. C.Shakher, A.K.Aggarwal (Holography Lab., Central Sci. Instruments Organization, Chandigarh, India).
Opt. & Laser Technol. (GB), vol.15, no.4, p.206-8 (Aug. 1983).
A moire method based on holographic interferometry is shown to be a powerful tool for non-destructive testing of diaphragms. (6 refs.)

103439 Contrast techniques for phase separation in the scanning electron microscope. J.Paul, B.Bauer (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Prakt. Metallogr. (Germany), vol.20, no.5, p.213-21 (May 1983). In German, English.
Two methods of contrasting by imaging flat surfaces in the SEM are presented One method utilises the increase in atomic number difference of the phases to be measured metallographically by selective coating with a chemical layer. This gives a sufficient contrast even with phases of low atomic number difference. With very fine structures such that back scattered electrons give a poor resolution, low-energy secondary electrons were used to form an image. Here the different microroughnesses of the different phases of a freshly polished sample were used. With these methods quantitative measurements were possible of very fine structured elements, which normally can not be studied due to poor contrast and low resolution. (9 refs.)

103440 Load fixture for uniform plastic deformation of single crystals. G.Georgeson, F.Milstein (Univ. of California, Santa Barbara, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1026-30 (Aug. 1983).
In conventional tensile or compressive tests of single crystals, plastic deformation by slip occurs nonuniformly owing to a slip plane rotation and constraint of the specimen's ends. To minimize these problems, a 'load fixture' (LF) that employs an air bearing and magnetic field (to provide for free rotation of the ends of the specimen) has been designed and built. The frictionless air bearing minimizes the tendency of the system to develop internal torques during the deformation of single crystals, particularly those with low critical resolved shear stresses. The LF has been of rotation on the 'boundary of slip' (i.e. on the slip plane that separates slipped from unslipped material in the plastically deformed crystal), the line of action of the applied force is maintained coincident with the samples' central axis. The LF is particularly useful for testing small ductile crystals and for studying mechanical hysteresis. (17 refs.)

103441 The gel electrode: a new method of detecting fatigue cracks. W.J.Baxter (Phys. Dept., General Motors Res. Labs., Warren, MI, USA).
Scr. Metall. (USA), vol.17, no.7, p.815-16 (July 1983).
Introduces a new electrochemical technique which can detect and image surface fatigue cracks in metals in a very simple manner. It is based upon two factors: (i) the rupture of surface oxide films during fatigue of the substrate metal and (ii) a modified version of a printing technique developed by Klein (1966) for the study of defective sites of high electrical conductivity in anodic oxide films. The technique is illustrated by an image of a fatigue crack in 7075-T6 aluminum. (3 refs.)

103442 Methods of determining crack growth rate in cyclic crack resistance tests of materials. S.Ya.Yarema (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.408-12 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.45-51 (Sept.-Oct. 1982).
It is shown that in order to determine the optimum method of determining crack growth rate further investigations of existing methods are necessary. As the basis of a standardised method it is suggested that one uses a method which does not smooth the original data, that is, the method of finite differences and its modification. This provides the possibility of determining not only certain average values of the fatigue crack resistance characteristics of a material but also of describing them from standpoints of mathematical statistics. (14 refs.)

103443 Experimental checking of a model for calculating the scale factor in fracture of large samples with cracks. I.P.Gnyp, B.K.Ganulich, V.I.Pokhmurskii (G.V. Karpenko Physicomech. Inst., Acad. of Sci., L'vov, Ukrainian SSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.413-17 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.51-7 (Sept.-Oct. 1982).
The authors show how in fracture of plastic materials almost all of the energy is consumed in plastic deformation at the crack tip, and, therefore, a force approach has to be made to determine the degree of influence of the scale factor on crack resistance. Experimental evidence is presented to illustrate the above. (7 refs.)

103444 Acoustic emission during thermal cycling of heat-resistant steel. R.Zuchowski, A.Pshonka (Wroclaw Polytech. Inst., Wroclaw, Poland).
Strength Mater. (USA), vol.14, no.6, p.828-33 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.97-101 (June 1982).
A study of specimen acoustic properties during thermal cycling was carried out using steel 12HMF. The results showed: the existence of a relationship between the amount of energy absorbed by a specimen and the intensity of AE signals; the periodic nature of AE during thermal cycling probably caused by the sudden nature of deformation observed during thermal cycling; extinction of emission during the few cycles before failure. Similar indication may be observed during static tensile tests on metals, and consequently AE may be used to study and determine the failure mechanism also during thermal cycling; and a marked difference between AE intensity in the specimen heating and cooling periods. The AE intensity during specimen heating was an order of magnitude greater than during cooling, and this probably indicates a greater amount of damage initiated during specimen heating. (3 refs.)

103445 Effect of the stiffness of testing machines on the relationships of deformation and fracture of materials with a heterogeneous structure. A.A.Lebedev, V.P.Lamashevskii, P.T.Alfimov (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.930-5 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.64-7 (July 1982).
Attention is given to the relationships governing the deformation and fracture of the material taking into account the reserve of elastic energy accumulated in the testing machine-specimen system. The investigations were conducted with special reference to structurally heterogeneous quasibrittle materials. (8 refs.)

103446 Tensile tests with rates up to 10^2 sec^{-1}. G.V.Stepanov, V.M.Tokarev (Inst. of the Strength of Materials, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.951-4 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.81-4 (July 1982).
Tests in the intermediate range of strain rates ($\dot{\epsilon}=10^{-1}$-10^2 sec^{-1}) encounter serious difficulties: series-produced testing machines cannot be used for them because of insufficient power of the drive. To eliminate the difficulties of testing in the range of these higher strain rates, a special installation was worked out. Loading of the specimen is effected with the aid of the kinetic energy of the ram of a vertical impact testing machine with relatively small mass whose inertial motion is transmitted to the specimen through a screw-type loading mechanism. (7 refs.)

103447 Machine for testing polymer materials in the three-dimensional stressed state at various temperatures. N.P.Demenchuk, A.Ya.Gol'dman (Leningrad Refrigeration Industry Technol. Inst., Leningrad, USSR).
Strength Mater. (USA), vol.14, no.7, p.980-4 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.105-9 (July 1982).
The machine described provides quite simple solutions of certain problems of testing under pressure at various temperatures which have been checked in service for five years. It is an improved variation of earlier developed machines. The machine makes it possible to load a sample with a purely hydrostatic pressure to investigate compressibility, tension-compression, and torsion with the application of pressure under simple and programmed loads and provides the capability of obtaining the following relationships: deformations to stresses with a constant strain rate; deformations to time in creep; stresses to time in relaxation with different values of hydrostatic pressure and temperature. (8 refs.)

103448 Equipment 'VAIR' for mechanical tests on materials in a nuclear reactor. V.I.Moseev, M.G.Bul'kanov, A.S.Kruglov, Yu.M.Pevchikh, V.A.Fazkullin.
Strength Mater. (USA), vol.14, no.7, p.989-92 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.114-16 (July 1982).
Comprehensive equipment for studying material reactor mechanical properties was developed. It consists of a test unit placed in the channel of a reactor, a measuring and recording complex a system for monitoring and controlling the equipment, and a control panel. The test unit provides deformation of each specimen in a schedule determined by the experimental program. (3 refs.)

103449 Surface crack depth-bursting strength relation of glass containers. S.Yokokura, A.Yoshida (Brewing Sci. Lab., Kirin Brewery Co. Ltd., Takasaki-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.4, p.196-8 (1983). In Japanese.
A method of measuring crack depth on the outer surface of a glass was proposed. From a container sample, a ring section was cut using a diamond cutter, and the cut surface was then polished using an abrasive of 800 mesh. The ring section was then immersed in a liquid, the refractive index of which was about 1.5. The depth of the surface crack of the polished ring section was measured with a stereomicroscope in oblique lighting. The measured values agreed with values which were calculated from the measured bursting strength and K_{Ic} of samples. (3 refs.)

103450 Basic principles of thermal neutron radiography. M.R.Hawkesworth, J.Walker (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.5-21
This review concentrates on the basic principles of radiography with beams of thermal neutrons. First, the principles of neutron beam production are discussed since the generation of a 'radiographic quality' beam is of primary importance whatever the neutron source or image detector available. This is followed by a summary of the neutron sources available for radiography to highlight the basic principles involved and their advantages and disadvantages in this application. The various image detectors available are then discussed with emphasis on screen-film detectors as these are by far the most widely used in thermal neutron radiography at present. (41 refs.)

103451 Physics of neutron radiography using selected energy neutrons. W.L.Whittemore (General Atomic Co., San Diego, DA, USA), H.Berger.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.23-33
A wide variety of neutron radiographic problems are best solved using specially selected neutron energies. These energies can range from very cold neutrons (<0.001 eV) to 14 MeV. The production, utilization, and detection of neutrons with these different energies frequently involve special considerations discussed in this report. Examples of neutron radiography are given for each of the energy regions except thermal which is treated in another report presented in this Conference. (45 refs.)

103452 Nuclear industry application of neutron radiography in Europe. J.C.Domanus (Riso Nat. Lab., Roskilde, Denmark), P.von der Hardt.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.35-46
The introduction of nuclear energy in Europe has considerably remained behind predictions made 10 years ago. But even the revised, more cautious predictions indicate that the installed generating capacity inside the European Community will double over the next five years. Among the numerous tools available to the underlying R&D programmes, neutron radiography has acquired a solid position as an inexpensive, flexible, and reliable non-destructive testing method. Nearly all European neutron radiography installations are based at government-owned research centres, with a majority using reactor beams. Nuclear industries operate mainly as co-sponsors of R&D programmes using these installations. (38 refs.)

103453 Application of neutron radiography in Japan. M.Kobayashi (JAERI, Gumma-ken, Japan), N.Wada, J.Sekita.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.47-50

The history and the present state of neutron radiography in Japan are reviewed. Three types of neutron sources, namely nuclear reactors, accelerators and radioisotopes are now used. The interests on the application on neutron radiography become greater and greater in the industries, such as atomic energy, aeronautics and space, etc. (7 refs.)

103454 Neutron radiography facilities using neutron beams from nuclear reactors. E.R.Kartashev (All-Union Res. Inst. of Radiation Engng., Moscow, USSR).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.51-7

The author presents diagrams, descriptions and main technical characteristics of a number of Soviet neutron radiography facilities. The facilities utilize neutron beams from the swimming pool type reactors RBT-6 and MR, fast reactor BR-5, from the water-cooled and water-moderated reactor VVR-K and heavy-water reactor TVR. (7 refs.)

103455 Review of neutron radiography development activities at Argonne National Laboratory. A.DeVolpi (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.59-65

Argonne National Laboratory developments and applications in neutron radiography have focused on nondisruptive examination of nuclear-reactor fuel under a variety of conditions, including fresh and irradiated single- and multiple-pin samples that are contained in capsules and coolant loops, some of which have thick walls or thermal-neutron filters. The developments, which began in the early 1960s, include special techniques for energy, time, and dimensional resolution, as well as accommodation of unique radiographic conditions. The applications have been designed to match the capabilities of TREAT, HFEF, and IPNS reactor and accelerator sources. (19 refs.)

103456 A review of ten years of operation of the industrial neutron radiography facilities associated with the Triton reactor at the Fontenay aux Roses nuclear research center. G.Bayon, L.Laporte, J.Le Gail (CENS, Gif-sur-Yvette, France).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.67-76

The authors make a brief presentation of the two facilities which were in operation until the second half of 1981, an overall review is compiled, showing the progress in activities in the area of the inspection of inactive parts from industry. Slides reproduce concrete cases of neutron radiographic inspection, the main fields of application are clarified, including pyrotechnics, plastics and similar materials, fuels, lubricants, metallurgy, biology and the arts. (no refs.)

103457 Applications and trends of industrial neutron radiography. R.L.Newacheck (Aerotest Operations Inc., San Ramon, CA, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.77-82

Industrial applications of neutron radiography have expanded over the last 10 to 12 years as this relatively new nondestructive testing technique has been accepted as a necessary and routine test procedure. In the late 1960s, neutron radiography was considered only for inspection of space systems components and other high reliability and/or man-rated systems. As the Space program slowed, applications narrowed to inspection of components for military aircraft and missiles. In most cases, the principal use was for inspection of explosive-actuated devices such as shielded mild detonating cord, separation bolts, severance assemblies, gas cartridges and power devices. In recent years, although the explosive device inspection applications have continued to grow, other applications have expanded to share equally in the use of neutron radiography for routine inspection. These applications include inspection of ceramic capacitors and electronic filters along with other electronic devices, complex mechanical assemblies, and detection of contaminants or residual core material in complex machined assemblies and gas cooled aircraft turbine blades. (no refs.)

103458 Neutron radiography at Lucas Heights. P.A.Gillespie, T.Wall (Australian Atomic Energy Commission, Lucas Heights Res. Labs., Lucas Heights, New South Wales, Australia).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.85-92

The development and progress of neutron radiography at the Australian Atomic Energy Commission is described for the period 1972 to the present. The early work involved standardisation of sensitometric data for the indium transfer-foil techniques. The superiority of direct methods using gadolinium converter screens was recognised, and subsequent work was carried out using this process of imaging the neutron beam. More recently, the use of fluorescent intensifier screens has been investigated. Successful applications, in terms of regular and routine service work, have been limited to projects in the aircraft industry. Specific problems have been solved in the explosives, electronics and nuclear industries, and a successful research program involving the monitoring of in vivo plant root growth has been supported. Although the AAEC offers a routine commercial service in neutron radiography, the logistics of using an immobile reactor neutron source to solve problems in non-nuclear related fields remains a barrier to many potential users of neutron radiography. (1 ref.)

103459 Neutron radiography in Brazil. J.D.Rogers (Federal Univ. of Rio de Janeiro, Rio de Janeiro, Brazil).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.93-8

Neutron radiography studies being carried out in reactor centres in Brazil are discussed. These research projects are under way using the 5 MW swimming pool reactor at the Institute of Energy and Nuclear Research (IPEN) in Sao Paulo and the Argonaut reactor at the Institute of Nuclear Engineering (IEN) in Rio de Janeiro. (8 refs.)

103460 Use of a neutron guide in industrial neutron radiography. M.Zaccheo, J.Berthon, G.Uzureau, A.Laporte (CENS, Gif-sur-Yvette, France).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.99-106

The authors describe the neutron radiography facility associated with the Orphee high flux reactor at the Orphee high flux reactor at the Saclay Nuclear Research Center. The authors discuss: The presentation of the facility, with emphasis on all the mechanical systems involved; Description of the control and monitoring console; A non-exhaustive list of the facility's potentialities; The advantages and drawbacks of the use of a neutron guide to carry out industrial neutron radiography. (no refs.)

103461 Status report on the activity of the neutron radiography group in Pusat Penelitian Teknik Nuklir Bandung. A.Kusnowo, Djajusian, D.Umar, F.P.Wattimury.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.107-10

This report provides information concerning the current activity of neutron radiography group in Pusat Penelitian Teknik Nukir (Research Centre for Nuclear Technique) in Bandung, Indonesia. The standardization (using transfer model) of neutron radiography is the main activity. Experiments were done and directed to support the need of reactor technology, metallurgy, and biology. (no refs.)

103462 Characteristics of neutron radiography systems using accelerators and a research reactor. E.Hiraoka, M.Fujishiro, Y.Tsujii, J.Furuta (Radiation Center of Osaka Prefecture, Sakai, Japan).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.111-18

The equipments for neutron radiography using a 1-MeV Van de Graaff type accelerator and a 18-MeV electron linac of the Radiation Center of Osaka Prefecture (ORC) and Kyoto University Research Reactor (KUR) were set up. The characteristics of neutron beam and the radiographic image qualities with various films available were measured by a Beam Purity Indicator and a Sensitivity Indicator approved by ASTM and a System Image Quality Indicator devised by Barton. (10 refs.)

103463 Development of a neutron radiography system at the TRIGA mark III reactor of the nuclear center of Mexico. J.Altamirano (Inst. Nacional de Investigaciones Nucleares, Mexico City, Mexico), N.Segovia, M.Monnin.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.119-26

The TRIGA MARK III Reactor provides usable neutron yields for use in Neutron Radiography. Neutron Radiographs showing acceptable resolution obtainable with a simple set up can be produced in exposures as short as three minutes with efficient neutron converters and fast film. The facility used for thermal neutron radiography is described. The beam configuration for radiographic applications provided a total beam intensity of 3.85×10^6 n/cm^2-sec with a thermal neutron intensity of 2.89×10^5 n/cm^2-mR, a cadmium ratio of 3.65, and a γ-intensity of 30 R/hr over a useful beam coverage 8 inches diameter area. The collimation system was improved by constructing diaphragms of paraffin lead and cadmium, which had the functions of a diverging collimator; the L/A ratio is about 135. (4 refs.)

103464 Neutron radiography experiences at the low flux reactor. J.J.Veenema, D.Mesman, H.P.Leeflang (Netherlands Energy Res. Found., Petten, Netherlands).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.127-33

At the Low Flux Reactor from ECN at Petten, a neutron radiography installation is in use for the evaluation of neutron radiography techniques and the non-destructive testing of non-radioactive objects. For this purpose a vertical beam is used from this Argonaut-type reactor with a maximum power of 10 kW. In general the direct detection technique with gadolinium foil is applied. Application of neutron radiography for metal bonded specimens have shown very useful results. (3 refs.)

103465 Progress in NR techniques and applications at AWRE Aldermaston. P.H.White, A.F.Thomas, B.G.Holland, G.S.G.Tuckey (AWRE, Aldermaston, England).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.135-43

AWRE Aldermaston operates a small NR team on the HERALD 5 MW reactor. Most of the work is done for the UK Ministry of Defence but some work is undertaken for outside agencies. NR with either thermal or cold neutrons is used for ordnance, reactor and aircraft items. Dynamic neutron radiography of an internal combustion engine has been demonstrated. New techniques are incorporated as required. Under development are an anti-scatter grid for enhanced detection of small density differences and a two axis tilt table for enhanced crack detection. Alternative sources have been investigated and a D-T neutron source is used routinely for NR. (no refs.)

103466 Neutron radiography DIDO reactor. D.J.Taylor (AERE, Harwell, Didcot, England).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.145-51

Two facilities are described, a cold neutron beam which extends outside the reactor containment building where it is used for dynamic radiography, and a thermal neutron beam within a shielded handling cell suitable for both radioactive and inactive specimens. Examples of utilisation and techniques are described. The external beam is particularly valuable for radiographing potentially hazardous equipment, e.g. an operating gas turbine engine. The cell beam is suitable for a wide range of objects from highly radioactive experimental rigs and reactor control absorbers to turbine blades for aircraft jet engines. Safety aspects and the training of operators are considered. (6 refs.)

103467 Neutron radiography at the general electric nuclear test reactor. C.E.Leighty (General Electric Co., Pleasanton, CA, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.153-62

Neutron Radiography is presently being performed on a routine production basis. The neutron source is the General Electric designed and constructed Nuclear Test React, a 100 kW (t) graphite-moderated and -reflected, light-water-cooled, thermal reactor at the Pleasanton, California, USA, Vallecitos Nuclear Center. The author discusses the facility design and unique capabilities including collimation, two beam ports, fixturing, irradiated nuclear fuel transfer neutrography, and a variety of aerospace, military, nuclear and commercial applications. (23 refs.)

103468 Neutron radiography facilities at Sandia National Laboratories, Albuquerque (SNLA). F.A.Hasenkamp (Nondestructive Testing Div., Sandia Nat. Labs., Albuqueque, NM, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.163-71

SNLA has had a neutron radiography (NR) facility since 1964. The author describes the two reactor facilities at SNLA and their NR applications and developments. (7 refs.)

103469 Neutron radiography techniques at Sandia National Laboratories, Albuquerque (SNLA). F.A.Hasenkamp (Nondestructive Testing Div., Sandia Nat. Labs., Albuquerque, NM, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.173-80

Previously existing neutron radiographic techniques at SNLA proved inadequate to resolve individual component layers within a thermal battery cell stack. The author describes the investigation that was successfully conducted to improve the technique and achieve the necessary resolution. Another improvement that has been investigated is the installation of a cold neutron capability. This investigation, conducted by an outside contractor, shows clearly that a greatly improved neutron radiography capability for some conditions would be gained. No determination has been made at this time whether or not it will be installed. (3 refs.)

103470 **Description and characterization of the BR1 neutron radiography facility.** H.Tourwe (SCK/CEN, Mol, Belgium).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.183-9
The SCK/CEN BR1 nuclear reactor is a natural uranium graphite reactor. This reactor is very well suited for neutron radiography because of the easy access and because of the adequate neutron flux level. The BR1 neutron radiography facility is a dry installation, installed at a tangential beam channel. It has a L/d ratio of 75 and is mostly used for non-destructive control purposes with the direct detection technique. (3 refs.)

103471 **Six years' experience with the double beam neutron radiography facility at the Riso National Laboratory.** P.Knudsen, J.Olsen (Riso Nat. Lab., Roskilde, Denmark).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.191-7
The Riso neutron radiography (NR) facility utilizes a homogeneous solution-type reactor (L-55, Atomics International) as the neutron source. The principal application of the Riso facility is the nondestructive examination of water reactor fuel, i.e. zircaloy clad uranium dioxide. The NR technique is useful for the characterisation of features which would otherwise normally require destructive examination. Examples are: pellet cracks and center voids, local hydriding of the cladding, and presence of water in defect fuel rods. The usefulness and the technique is very much increased by detailed correlation with other methods. The authors present typical and illustrative examples from the six years of NR experience at Riso. (4 refs.)

103472 **A ^{233}U fuelled reactor for neutron radiography.** C.S.Pasupathy, M.Srinivasan (Bhabha Atomic Res. Centre, Bombay, India), V.Anandkumar, N.Kannan.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.199-207
A compact ^{233}U fuelled neutron source reactor is under construction at the Reactor Research Centre, Kalpakkam, India, to be used primarily for Neutron Radiography of fuel pins, subassemblies and other active components of the Fast Breeder Test Reactor. This compact source reactor is located underneath a hot cell where active fuel elements are to be visually examined. A leak tight tube extending down from the cell above permits active objects to be lowered for Neutron Radiography. Sequential pictures will be taken using casettes driven on a chain conveyor system. Besides the beam for active sample radiography an additional beam would be available for non active sample radiography. The beam tubes are to be provided with standard collimator, aperture control and beam shutter arrangements. (4 refs.)

103473 **Design and safety aspects of neutron radiography rig for examination of irradiated objects.** B.Raj, C.K.Iyer, P.Kalyanasundaram, P.Rodriguez (Radiometall. Lab., Reactor Res. Centre, Tamil Nadu, India).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.209-17
Neutron Radiography has emerged in recent years as an important non-destructive test method for post-irradiative test method for post-irradiation examination of irradiated objects. A swimming pool type reactor (30 kW) in the basement of hot cells, having neutron flux of 3×10^{10} at reflector surface is to be utilised for neutron radiography. The examination is carried out by lowering the objects in front of neutron beam from one of the cells through a containment and guide tube which is an integral part of the hot cell extending to the basement below it thus avoiding transfer of irradiated objects from hot cells for the purpose of neutron radiography. This approach has many advantages, but it puts severe constraints on the design and safety aspects of neutron radiography rig. A moving cage holds the object and is lowered in the containment and guide tube for neutron radiography. Cassette feed mechanism and controls have been devised such that it is possible to take six shots without human entry to the neutron radiography area. (no refs.)

103474 **Development of an online neutron radiography system of high resolution for nuclear materials.** K.Kanda, K.Yoneda, S.Fujine (Res. Reactor Inst., Kyoto Univ., Osaka, Japan).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.219-25
A neutron radiography system of high efficiency and of high resolution for non-destructive measurements of materials has been developed by using the E-2 experimental hole attached to the Kyoto University Research Reactor (KUR). Comparing with the ARRR, the E-2 hole has the following advantages; (i) high neutron density, 1.2×10^{6} n/cm^{2}.sec, (ii) large cadmium ratio of gold foil, 400, and (iii) low gamma ray contamination, 4.2 R/h. A high quality TV camera was installed, of which output is observed directly and visually, and connected to a computer system. The system has been successfully applied to identifying the location of burnable poison in side plates of reactor fuel. (3 refs.)

103475 **Neutron radiography installation in the HFR reactor pool.** J.Bordo (Commission of the European Communities, JRC Petten Establ., Petten, Netherlands), H.P.Leeflang, J.J.Veenema.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.227-34
The ability of neutron radiography to provide high quality radiographs of highly radioactive specimens has led to its use in irradiation testing technology. Ten years ago a high flux radiography facility has been installed in the HFR at Petten. It is applied to carry out pre- and post irradiation examination of capsules being irradiated in the HFR. The author gives a description of the equipment available at present, the loading provisions and the detection technique. (4 refs.)

103476 **Neutron radiography installation for long fuel rods at the HFR Petten.** H.P.Leeflang, J.J.Veenema (Netherlands Energy Res. Found., Petten, Netherlands).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.235-40
In order to perform neutron radiographic examinations of spent fuel rods from power reactors with a length between 2 and 4 metres a new neutron radiography facility has been developed, using a neutron beam of the High Flux Reactor at Petten. This dry installation has a high collimation ratio. Long fuel rods can be inserted from a shielded transport container. The radiographs are recorded by the tracketch technique on cellulose nitrate film held in a specially designed camera. (2 refs.)

103477 **Cold neutron radiography applied to the study of hydrogen in palladium.** M.R.Hawkesworth, J.Walker (Dept. of Phys., Univ. of Birmingham, Birmingham, England), J.P.G.Farr.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.291-302
The application of cold neutron radiography to metallurgical studies requiring high spatial resolution is illustrated with examples from a study of the palladium-hydrogen system. The now standard methods for direct technique radiography requiring good resolution were used and proved adequate, namely single emulsion films pressed firmly against a single (back) intensifier screen of polished gadolinium foil 25 μm in thickness, with neutron exposures in the range 2 to 6×10^{9} cm^{-2}. A relatively modest printing enlargement of 3 to 5X was found to be convenient for direct presentation of the results and a representative selection is included. (14 refs.)

103478 **Determination of hydrogen content in materials and products by neutron radiography method.** N.D.Tyufyakov (All-Union Res. Inst. of Radiation Engng., Moscow, USSR).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.303-7
When some materials and products made of them are placed in the hydrogenous medium the hydrogen in this medium is capable of accumulating in these materials to produce hydroxides, hydrides and other chemical compounds which induce the parameters of the corresponding products to become worse. The possibility and features of the quantitative determination of low contents of hydrogen in some materials and products by neutron radiography are discussed and relations for the evaluation of the method sensitivity and the results of the experimental studies presented. (4 refs.)

103479 **Optimization of a 'constant quality level control system'. The 'ORPHEE' industrial neutron radiography facility.** G.Bayon, A.Laporte (CENS, Gif Sur Yvette, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.309-14
The authors describe the operations that have been optimized to carry out neutron radiography on parts from industry. Transport and storage products, preparation of parts and marking, detector optimization, taking pictures, film treatment, quality control and administration. (2 refs.)

103480 **Neutron radiographic inspection of composite and composite-metal structures.** W.E.Dance (Vought Corp. Advanced Technol. Center, Dallas, TX, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.315-23
The use of neutron radiography for nondestructive inspection of a variety of composite and mixed composite/metal structures is being explored. Radiographic data are presented which illustrate the sensitivity of nonreactor neutron sources for imaging defects in laboratory specimens of complex, difficult-to-inspect structures. In some cases neutron radiography provides a direct complement to X-ray inspection, with resin porosity being imaged by the neutrons and the fiber distribution patterns being imaged by X-ray. In other cases, such as those involving complex adhesively bonded composite/metal structures, neutron radiography provides the only existing accurate and reliable method of imaging certain types of bondline deficiencies. (6 refs.)

103481 **Neutron radiography of Apollo ordnance.** K.G.Golliher (US Dept. of Energy, Albuquerque, NM, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.325-32
Neutron radiography played an important role in the successful Apollo missions. Neutron radiography was used, for the first time, on a production basis to examine the internal details of ordnance devices employed in the Apollo Program. Ordnance devices ranged from charges which separated the massive booster stages to those which triggered the release of re-entry parachutes. Discussed are the early developments in neutron radiography and the conversion of this infant nondestructive technology into production capabilities. (no refs.)

103482 **Contrast enhancement in neutron radiography using a gaseous penetrant.** B.G.Holland (AWRE, Aldermaston, England).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.333-7
The absorption cross section of ^{3}He is so great that even a few millimetres of gas at moderate pressures produce a significant change in the transmission of thermal and cold neutrons. This provides the possibility of a novel method for the detection of small leakage paths by neutron radiography. The paper first outlines the standard techniques for contrast enhancement and then illustrates the use of He with an account of an actual examination of electric bridge wire squibs, with some comment on sensitivity and cost. (no refs.)

103483 **Doping explosive materials for neutron radiographic enhancement.** K.G.Golliher (US DOE, Albuquerque, NM, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.339-46
Most ordnance materials that are inorganic mixtures neutron radiograph poorly, or not at all, particularly if contained within a thick metallic structure. Investigations were made relative to selecting a material(s) with high neutron absorbing property that when added to the explosive mixture enhanced the imaging of the material, and the quantity of the additive would not interfere with the proper reaction of the chemical mixture. The results are reported. (6 refs.)

103484 **Resonance neutron radiography.** R.A.Schrack, J.W.Behrens, R.G.Johnson, C.D.Bowman (NBS, Washington, DC, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.495-502
The production of images by the use of neutrons having energies in the resonance region is described. Two-dimensional position-sensitive neutron detectors are used to produce transmission images using neutron time-of-flight techniques at the National Bureau of Standards' electron linac facility. Two types of detectors are described. The first is a crossed-wire proportional counter using ^{3}He as the neutron-sensitive component. The second type utilizes a multichannel plate electron multiplier and a resistive anode readout. A lithium glass scintillator is the neutron-sensitive component in the latter detector. Resonance neutron radiography, using these detectors, has the capability of producing images with isotopic and chemical element discrimination in a complex matrix with a resolution of 1 mm or better. (11 refs.)

103485 **The influence of multiple refraction effects on the sharpness of neutron radiographs of ferromagnetic materials.** A.J.Allen, D.K.Ross (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.919-27
Cold neutron radiographs of ferritic steel components can show an unsharpness in the image of edges which would seriously affect inspection studies. It is shown that this unsharpness is due to multiple refraction effects at mag-

netic domain boundaries which combine so as to cause a broadening of the beam. On the other hand, small angle scattering due to smaller inhomogeneities, while being measurable, is unlikely to detract from the radiography. The variation of the multiple refraction broadening with neutron wavelength, sample thickness, magnetic domain size and other magnetic properties is considered as are various means of minimising the effect. In particular, the use of shorter wavelength neutrons is beneficial. Possible uses of the phenomenon for identifying ferromagnetic regions are discussed. Finally, complications introduced by having finite Bloch wall thicknesses are outlined. (12 refs.)

103486 Small angle neutron scattering complementing neutron radiography. J.Schelten (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.953-9
In neutron radiography inhomogeneities of sizes down to a few micrometers are detectable by an imaging technique. In small angle neutron scattering experiments inhomogeneities in the Å range up to 1000 Å diameter are observed by neutron scattering. The use of this technique for nondestructive testing of low-alloyed, high-alloyed and pressure vessel steels which are heat-treated, creep-tested, and neutron-irradiated is described. (3 refs.)

103487 Neutron radiography standards in the United States of America. J.J.Haskins (Aerotest Operations Inc., San Ramon, CA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.985-91
Consensus standards for industrial neutron radiography are of very recent origin in the United States. Commercial applications of neutron radiography first began in 1967, with the first consensus standard issued in 1975. Clearly, much work preceeded the issuance of this first standard, but even that is of recent history when compared with several other NDT methods. Standards work in the United States today is divided into three major areas—commercial standards, nuclear standards, and personnel qualifications. The author considers the history, current status, design philosophy, and projections for the future in these three areas. (no refs.)

103488 Work on the characterization of sensitive surfaces used in neutron radiography, conducted under the auspices of AFNOR. G.Bayon, A.Laporte (CENS, Gif-sur-Yvette, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.997-1001
In industrial neutron radiography, the sensitive surfaces routinely used are silver films combined with a gadolinium converter. To meet requests from industry concerning the choice of emulsions, standardization work was undertaken under the auspices of AFNOR, jointly with Commission No.2 of COFREND. The authors discuss these activities, and describe the equipment and standard source used for irradiations, with an explanation of the results obtained. The irradiation source is a C^{14} source, and many types of film marketed by Agfa-Gevaert and Kodak-Pathe have been tested to determine their sensitivity and average contrast. (1 ref.)

103489 Methodology used to characterize an industrial neutron radiography facility; use of the specific image quality indicator. G.Bayon, A.Laporte (CENS, Gif-sur-Yvette, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.1003-11
The user of nondestructive testing by neutron radiography for perfectly reliable parts needs assurances concerning the results obtained, both in terms of quality and of reproducibility. Work on standardizing procedures has therefore been carried out, and the results of these deliberations are discussed. A simple method for the characterization of a facility requires the measurement of detector unsharpness, measurement of geometric unsharpness, measurement of gamma background, and beam characterization from the standpoint of neutron attenuation. Also described are the specific image quality indicators used for many tests performed to identify clearances or cracks, as well as material deficiencies. (5 refs.)

82.00 PHYSICAL CHEMISTRY

82.20 CHEMICAL KINETICS

103490 Molecular structure and reaction mechanism: a topological approach to quantum chemistry. P.G.Mezey (Dept. of Chem., Univ. of Saskatchewan, Saskatoon, Canada).
THEOCHEM (Netherlands), vol.12, p.81-99 (Aug. 1983).
Reaction topology and the differentiable manifold model of the nuclear configuration space and potential energy hypersurfaces provide a mathematical framework for computer-aided quantum-chemical synthesis planning. Relations between the geometrical and topological models of molecules and reaction mechanisms are analysed and properties of induced topologies in various product spaces are discussed. (136 refs.)

103491 Reactivity in the spinel formation reaction in CuO/Al_2O_3, Fe_2O_3, Cr_2O_3 systems. [Influence of Jahn-Teller effect]. K.S.R.C.Murthy (Electron Devices Lab., Indian Inst. of Sci., Bangalore, India), J.Ghose, E.Nageswara Rao.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.393-4 (Aug. 1983).
An attempt has been made to identify the reactivity pattern in the formation of aluminate, ferrite and chromite of copper from the respective metal oxides. In an earlier study, F.S. Stone and R.J.D. Tilley (1965) reported that among aluminates, gallates and indates of magnesium, zinc, nickel and copper, the formation of copper aluminate was associated with maximum reactivity. They attributed this to the Jahn-Teller effect of Cu^{2+} ions on the surrounding oxide lattice in the product phase ($CuAl_2O_4$). The present study has been carried out on the formation of $CuCr_2O_4$, $CuFe_2O_4$ and $CuAl_2O_4$ in order to gain better insight into the influence of the Jahn-Teller effect on reactivity. (14 refs.)

103492 Orthogonal collocation for the analysis of immobilized enzyme systems. Young Sung Ghim, Ho Nam Chang (Dept. of Chem. Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Comput. & Chem. Eng. (GB), vol.7, no.3, p.195-9 (1983).
Orthogonal collocation method is applied to the analysis of nonlinear ordinary differential equations containing Michaelis-Menten kinetics. The solution is expanded in a series of Lagrange interpolation polynomials and Gauss-Jacobi quadratures are used in calculating effectiveness factors. A set of nonlinear algebraic equations resulting from collocation approximation is conveniently solved by the Gauss-Seidel iterative method, but its convergence path is not monotonic. Although the rate of convergence depends on system parameters, orthogonal collocation is more efficient than the Runge-Kutta method in solving boundary value problems even at a high Thiele modulus. (15 refs.)

103493 The ideal law of mass action and first-order phase transition. M.Elwenspoek (Inst. fur Atom- und Festkorperphys., Freie Univ. Berlin, Berlin, Germany).
J. Phys. A (GB), vol.16, no.12, p.L435-7 (21 Aug. 1983).
The author shows that the ideal law of mass action for a chemical reaction $\mu A \rightleftharpoons A_\mu$ predicts a first-order phase transition if one allows μ to become large. (6 refs.)

103494 Incorporation of chemical kinetic models into process control. C.J.Herget, J.W.Frazer (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood, CA, USA: Western Periodicals 1981), p.130-5
An important consideration in chemical process control is to determine the precise rationing of reactant streams, particularly when a large time delay exists between the mixing of the reactants and the measurement of the product. A method is described for incorporating chemical kinetic models into the control strategy in order to achieve optimum operating conditions. The system is first characterized by determining a reaction rate surface as a function of all input reactant concentrations over a feasible range. A nonlinear constrained optimization program is then used to determine the combination of reactants which produces the specified yield at minimum cost. This operating condition is then used to establish the nominal concentrations of the reactants. The actual operation is determined through a feedback control system employing a Smith predictor. The method is demonstrated on a laboratory bench scale enzyme reactor. (4 refs.)

82.30 SPECIFIC CHEMICAL REACTIONS; REACTION MECHANISMS

103495 Study of dissociation and neutralization of the H_2^+ ion passing through a molecular hydrogen target in the energy range 10-100 keV. A.Bouliou, M.Sarret, P.Frere (Univ. de Rennes, Rennes, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1217-19 (2 May 1983). In French.
An original method easy to realize, is proposed giving the composition of a beam obtained from fast H_2^+ ions passing through a molecular hydrogen target. (5 refs.)

103496 Spin non-conservation in low-energy molecular charge-transfer reactions. E.E.Ferguson (Lab. de Resonance Electronique et Ionique, Univ. de Paris-Sud, Orsay, France).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.89-92 (29 July 1983).
The reaction $H_2O^+(^2B) + NO_2(^2A) \rightarrow H_2O(^1A) + NO_2^+(^1\Sigma)$ occurs at near the collision rate constant, 1.2×10^{-9} cm^3 s^{-1}, in spite of the fact that the reactants produce both a singlet and a triplet state and the products correlate only with the singlet state. This would be expected to yield a statistical weight factor of $^1/_4$ to be multiplied by the collision rate constant to obtain the maximum charge-transfer rate constant. The triplet products of the charge transfer are clearly endothermic. The singlet-triplet intersection has not been identified but the available information about the singlet and triplet states of the intermediate protonated nitric acid molecule is discussed. Four other examples of apparent 'spin violation' charge-transfer reactions have been noted, $H_2O^+ + NO$, $N_2O^+ + NO$, $CO^+ + NO$ and $CH_4^+ + O_2$. (16 refs.)

103497 Behaviour of a BZ oscillating system at low temperatures. A.K.Dutt, R.S.Banerjee (Dept. of Chem., Univ. Coll. of Sci., Calcutta, India).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.186-8 (29 July 1983).
The BZ oscillating reaction has been studied at low temperatures and it was noted that strangely enough the oscillation period itself showed some sort of periodicity. (5 refs.)

103498 Br_2 light emission from CW CO_2-laser-induced CF_3Br pyrolysis. G.Luijks, W.Knippers, G.Petrocelli, S.Stolte, J.Reuss (Fysisch Lab., Katholieke Univ., Nijmegen, Netherlands).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.232-7 (5 Aug. 1983).
A bright yellow-red glow is observed in a sample of CF_3Br gas (75 Torr) after CW CO_2-laser irradiation ($\leq$30 W). The spectrum of the electronic transition $Br_2(B \rightarrow X)$ is identified. The formation of vibrationally hot $Br_2(B)$ molecules via CF_3Br pyrolysis and Br recombination creates a strongly athermal distribution within the B state. (19 refs.)

103499 Infrared laser photoisomerization of 2-fluoroethanol in argon. W.F.Hoffman,III, J.S.Shirk (Dept. of Chem., Illinois Inst. of Technol., Chicago, IL, USA).
Chem. Phys. (Netherlands), vol.78, no.3, p.331-8 (1 Aug. 1983).
Different products result from single-photon IR photolysis of 2-fluoroethanol in solid argon depending upon the vibrational mode that is excited. Irradiation of the OH stretch causes an interconversion of the two most stable isomers T_t and $G_{g'}$. Irradiation of one CH stretch results in the formation of significant yields of the less stable G_t and T_g isomers. The isomers of 2-fluoroethanol can be photooriented in argon by IR irradiation. (15 refs.)

103500 State-selected molecular-beam reaction dynamics of K with HF (ν=1, j=5, 6 and 7). M.Hoffmeister, L.Potthast, H.J.Leosche (Facultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Chem. Phys. (Netherlands), vol.78, no.3, p.369-80 (1 Aug. 1983).
The crossed-molecular-beam method has been used to measure relative integral cross sections σ_r ($\nu=1$, j; E) of the endothermic (0.75 eV) reaction K+F ($\nu=1$, j)$\rightarrow$KHF+H as a function of both the rotational quantum number j (j=5, 6 and 7) and the translational energy $E(0.55 \leq E \leq 1.32$ eV) of the reagents. The vibrational-rotational (ν,j) states of HF were populated by infrared pumping with the radiation of a properly tuned pulsed chemical HF laser. In addition, relative cross sections with $\nu=0$ but averaged with respect to the initial rotational-state distribution of the HF molecules were also determined. The results exhibit three remarkable features: (a) $\sigma_r(\nu=1, j; E)$ rises with increasing j, (b) the steepness of the ascent roughly decreases with increasig E, (c) at $E=0.98$ eV reagent vibrational energy is about a factor of 200 more efficient in promoting the reaction than reagent translational energy. An intuitive dynamical model suggests that observations (a) and (b) are to be expected for a reaction governed by a potential-energy surface with

a late barrier. This is consistent with the well-known interpretation of large vibrational effects as indicated by result (c). (22 refs.)

103501 Bifurcation diagrams for two substrate oscillatory systems. J.Maselko (Inst. of Inorganic Chem. & Metall. of Rare Elements, Tech. Univ. of Wroclaw, Wroclaw, Poland).
Chem. Phys. (Netherlands), vol.78, no.3, p.381-9 (1 Aug. 1983).
The bifurcation diagrams for the Mn^{2+}-malonic acid-H_2SO_4-$KBrO_3$ and Mn^{2+}-oxaloacetic acid-H_2SO_4-$KBrO_3$ systems have been studied in a stirred tank reactor. Complex oscillations associated with a period-doubling bifurcation were found. Bifurcation diagrams for the two substrate malonic-citric and malonic-oxaloacetic acid systems were also determined. (19 refs.)

103502 Production of hydrogen by direct thermal decomposition of water with the aid of a semipermeable membrane. B.Cales, J.F.Baumard (Centre de Recherches sur la Phys. des Hautes Temperatures, CNRS, Orleans, France).
High Temp.-High Pressures (GB), vol.14, no.6, p.681-6 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
The direct thermal decomposition of water has been studied as a means of hydrogen production at high temperature. The evolved hydrogen and oxygen are separated with the aid of a zirconia membrane semipermeable to oxygen. The amounts of hydrogen collected at the reactor gas outlet appear to be controlled primarily by the electric characteristics of the semipermeable membrane. The experimental values of the hydrogen flow are compared to theoretical values calculated by a reactor simulation. (8 refs.)

103503 Effect of dielectric constant on EDTA-metal chelates—an ultrasonic study. G.L.N.Sastry (Dept. of Phys., TJPS Coll., Guntur, India).
Indian J. Pure & Appl. Phys., vol.21, no.5, p.320-2 (May 1983).
Employing a single-crystal, variable-path interferometer, five EDTA-metal chelates, viz. EDTA+$CrCl_3$, EDTA+$ZnSO_4$, EDTA+$CoCl_2$, EDTA+$SrCl_2$, and EDTA+KNO_3 have been studied at 30°C and pH=3.5 using 90%-10% water-dioxane mixture as solvent. The condition for a metal ion to form a chelate with EDTA under experimental conditions has been deduced in terms of radius of the metallic cation and valency of the cation. The experimental results have been discussed on the basis of Bjerrum's theory of ion association. The results on these chelates in water-dioxane mixture have been compared with those obtained when water was used as solvent. The present studies have been found to be in agreement with those obtained in the case of six other EDTA-metal chelates studied earlier by the author. Lower dielectric constant of the medium has been found to be favourable for the extent and scope of chelation. (12 refs.)

103504 A study of the temperature dependences of the $N_2^+ + N_2 \rightarrow N_4^+$ and $O_2^+ + O_2 \rightarrow O_4^+$ association reactions using the selected-ion flow-tube and drift-tube techniques. H.Bohringer, F.Arnold (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany), D.Smith, N.G.Adams.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.25-41 (1 Aug. 1983).
The three-body ion/molecule association reactions $N_2^+ + N_2 + He – k_1 \rightarrow N_4^+ + He$ and $O_2^+ + O_2 + He – k_2 \rightarrow O_4^+ + He$ have been studied in a variable-temperature selected-ion flow tube (SIFT) and a variable-temperature ion drift tube (DT). The rate coefficients k_1 and k_2 were determined using both apparatuses over uniquely wide temperature ranges, i.e. 45-520K for k_1 and 48-200K for k_2. Accurate measurements of k_2 at higher temperatures could not be made because of thermal break-up of the weakly bonded O_4^+ ion. The magnitudes and temperature dependences of k_1 and k_2 determined in the SIFT and DT experiments are in very good agreement, and can be represented by the analytical expressions $k_1 = 1.8 \times 10^{-29} (300/T)^{2.3 \pm 0.2}$ $cm^6\ s^{-1}$, $k_2 = 5.5 \times 10^{-31} (300/T)^{2.7 \pm 0.3}$ $cm^6\ s^{-1}$. However, noticeable deviations from these power-law dependences occur at the lowest temperatures. The results are compared with those obtained from previous studies of these reactions and for the analogous association reactions involving N_2 and O_2 third bodies. (38 refs.)

103505 Pyrolysis effects on the reactions of alkoxide anions. G.Boand, R.Houriet, T.Gaumann (Inst. de Chimie Phys., EPFL-Ecublens, Lausanne, Switzerland).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.95-103 (1 Aug. 1983).
The distribution of products in negative chemical-ionization spectra of alcohols are shown to remain unaffected (<1%) by pyrolytic reactions. On the other hand, it is shown that slow ion/molecule reactions can be obscured by fast processes implying impurities formed by pyrolysis. The importance of pumping speed in ion cyclotron resonance (ICR) spectrometers is also discussed. (11 refs.)

103506 Ab initio study of the hydration of ketenimine ($CH_2=C=NH$) by water and water dimer. Minh-Tho Nguyen (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium), A.F.Hegarty.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3811-15 (15 June 1983).
The detailed reaction pathway for the hydration of the ketenimine $CH_2=C=NH$ by H_2O and by $(H_2O)_2$ has been investigated by ab initio methods using STO-3G, 4-31G, and 6-31G** basis sets. The optimized geometries of the points on the reaction surface were determined by the gradient method. The preferred reaction pathway is with the water dimer through a 'preassociation' mechanism where a small amount of initial bonding occurs via attack (by oxygen) at the central carbon of the ketenimine. Proton transfer (to the β-carbon) then occurs at or just after the transition state without any appreciable changes in the C-O bond distance. The reaction (which is calculated to have an activation barrier of 22 kcal mol^{-1} in 4-31G) is therefore concerted but highly asynchronous. (22 refs.)

103507 A transition state theory of nonadiabatic unimolecular reactions controlled by a conical intersection. Application to the $C_2H_4^+$ ion. M.Desouter-Lecomte, C.Sannen, J.C.Lorquet (Dept. de Chimie, Univ. de Liege, Liege, Belgium).
J. Chem. Phys. (USA), vol.79, no.2, p.894-904 (15 July 1983).
The authors propose an extension of the RRKM method to nonadiabatic reactions. The basic ideas were suggested by Zahr, Preston, and Miller (1975) in the simpler case of a spin-orbit interaction for which the coupling matrix element remains constant over the configuration space. These ideas have been adapted to the more complicated case of a conical interaction. The rate constant is then expressed as a product of a RRKM rate term times an average probability of staying in a given electronic state which is evaluated from the Landau-Zener-Nikitin linear model. The method is applied to the dissociation of the $C_2H_4^+$ ion, whose reaction mechanisms have been previously determined by ab initio calculations, and for which convincing experimental observations suggest that the system can be represented by a microcanonical ensemble. The relevant rate constants are calculated as a function of energy and fragmentation yields derived therefrom. This gives rise to a mass spectrum calculated from first principles. Agreement with experiment is satisfactory. (46 refs.)

103508 Reactions of He^+, Ne^+, and Ar^+ with CH_4, C_2H_6, SiH_4, and Si_2H_6. H.Chatham, D.Hils, R.Robertson, A.C.Gallagher (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1301-11 (1 Aug. 1983).
The rate coefficients and product-ion distributions for the reactions of He^+ and Ar^+ with silane and disilane have been measured in a drift tube, typically for collision energies of 0.01-1 eV. The total charge-exchange rate coefficients are found to be roughly independent of E/N, or collision energy, and are about equal to the Langevin values for the reactions of He^+ with SiH_4 and C_2H_6 and Ar^+ with CH_4 and C_2H_6. The He^+ rate coefficients on CH_4 and Si_2H_6, and the Ne^+ rate coefficients on SiH_4 and Si_2H_6 are 50% to 80% of the Langevin values, while the Ar^+ rate coefficients on SiH_4 and Si_2H_6 are much smaller. Product ions tend to be hydrogen poor with very infrequent breaking of the C-C or Si-Si bonds. Furthermore, hydrogen stripping is more severe for the silanes than the alkanes. These product-ion distributions bear no resemblance to the product-ion distributions of either photoionization or electron collisional ionization. (35 refs.)

103509 Laboratory measurements in the energy range 0.02-1 eV of the rate constants of ion-molecule reactions involving CS^+. J.Barassin, R.Thomas, A.Barassin (Lab. de Phys. et Chimie de l'Environment, CNRS, Orleans, France).
J. Chem. Phys. (USA), vol.79, no.3, p.1546-8 (1 Aug. 1983).
The authors have studied the kinetics of exothermic reactions of CS^+ with molecules which are abundant in the interstellar medium and which have low boiling points in order to obtain low temperature data. The experiments were performed in a drift tube mass spectrometer apparatus. The buffer gas was helium at a pressure of 0.15 Torr. The CS^+ ions were produced in an electron impact ion source containing CS_2. The mass filter selected the CS^+ ions from the other fragment ions produced in the source and the CS^+ ions were introduced at low energy into the drift tube. The drift ion velocities in helium were measured over the energy range concerned. (11 refs.)

103510 A Fourier method solution for the time dependent Schrodinger equation: a study of the reaction $H^+ + H_2$, $D^+ + HD$, and $D^+ + H_2$. R.Kosloff (Dept. of Phys. Chem., Hebrew Univ., Jerusalem, Israel), D.Kosloff.
J. Chem. Phys. (USA), vol.79, no.4, p.1823-33 (15 Aug. 1983).
A new quantum mechanical time dependent integrator was used in the study of wave packet dynamics on potentials which include a deep well. The purpose of the study was to find the conditions, if any, for complex formation. The integrator, which is stable, conserves energy and norm and was used on the $H^+ + H_2$ system whose classical trajectory had been previously worked out. Almost no complex formation is found for the $H^+ + H_2$ system and its isotopic analogs. For high translational energies there was a good correspondence with the classical trajectory results, while for low translational energies where the classical trajectories become complex, the quantum calculations still show nonstatistical behaviour. For even lower energies, a quantum effect took place leading to zero reactivity. (26 refs.)

103511 Non-nearest neighbor random walks in reaction-diffusion processes. M.K.Musho, J.J.Kozak (Dept. of Chem., Univ. of Notre Dame, Notre Dame, IN, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1942-7 (15 Aug. 1983).
In the paper, the authors consider reaction-diffusion processes in which it is assumed that a migrating species (A) is subject to an interaction potential and may undertake nonnearest neighbor jumps in its diffusion towards a reaction center (B). For the case that the species A and B react irreversibly upon first encounter, the authors show how the efficiency of the process $A + B \rightarrow C$ is influenced by the nature of the interaction potential [a power law of the form $V(r) = r^{-s}$ with $r > 0$ and $1 \leq s \leq 12$] and the geometry (dimensionality and spatial extent) of the reaction space assumed. Their approach is based on a recently introduced, exact theory of d-dimensional walks on finite and infinite (periodic) lattices with traps and, accordingly, the results presented in the study provide an exact quantitation of the interplay between potential interactions and system geometry for the reaction-diffusion problems considered. The results reported may have considerable relevance to the problems of exciton migration in crystals, photosynthesis, and the surface diffusion of adatoms. (12 refs.)

103512 Effect of atomic spin-orbit state on reactivity: reaction of state-selected $Ca(^3P_j^0)$ with Cl_2. Huoy-Jen Yuh, P.J.Dagdigian (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2086-8 (15 Aug. 1983).
The authors report a substantial dependence of the chemiluminescence cross sections on reactant atomic spin-orbit state in the $Ca(^3p_j^0) + Cl_2 \rightarrow CaCl + Cl$ reaction, for which the $Ca(4s4p\,^3P^0)$ splitting is small: $E(^3P_2^0\text{-}^3P_1^0) = 106$ and $E(^3P_1\text{-}^3P_0) = 52\ cm^{-1}$. This reaction was chosen for initial study since its large reactive cross section might be expected to minimize scrambling of the spin-orbit states in the entrance channel. (16 refs.)

103513 Why are perturbations of HCl by N_2 and CO so different? II. Matrix isolation experiments. J.Perchard, J.Cipriani, B.Silvi, D.Maillard (Lab. de Spectrochimie Moleculaire, Univ. Pierre et Marie Curie, Paris, France).
J. Mol. Struct. (Netherlands), vol.100, p.317-39 (July 1983).
For pt.I see J. Chem. Phys., vol.67, p.3917 (1977). The infrared and Raman spectra of hydracids (HCl, DCl, $H^{35}Cl$, $D^{35}Cl$, HBr) codeposited with dopants P(Co, ^{13}CO, $^{13}C^{18}O$, N_2) in argon matrices are presented. Studies have been carried out over a wide concentration range for matrix/dopant ratios from 1000 to 10 which, together with H/D isotopic dilutions, allow identification of several $(HX)_m(P)_n$ aggregates (P=Co, N_2) such as $m=1$, $n=1, 2, 3$ (CO case), and $m=2$, $n=1, 2$(CO and N_2 cases). The straightforward identification of the bands assignable to the HCl-CO codimer for six isotopic species allows an accurate force field calculation to be done. For the $(HCl)_2(P)_n$ aggregates, intensity and frequency measurements are used for a comparison between the HCl molecules which are nonequivalent. From the whole data a comparison is drawn between the perturbing power of CO and N_2; this second molecule is a poorer electron donor than CO but is able, however, to destroy the HCl dimer structure. Finally, the relative stability of the various copolymers $(HCl)_m(P_n)$ is discussed using the results of careful diffusion experiments. It is shown that stability generally increases with m and decreases with n. (14 refs.)

103514 Prototropic charge migration in water. I. Rate constants in light and heavy water and in salt solution from oxygen-17 spin relaxation. B.Halle, G.Karlstrom (Dept. of Phys. Chem., Univ. of Lund, Lund, Sweden).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1031-46 (July 1983).
Oxygen-17 scalar relaxation data from light and heavy water and from KCl solutions are reported. From the pH dependence of the relaxation, the authors extract the rate constants for proton transfer between H_2O and H_3O^+ (k_+) and between H_2O and OH^- (k_-). In H_2O at 28°C, the authors find $k_+ = (7.1 \pm 0.4) \times 10^9\ dm^3\ mol^{-1}\ s^{-1}$ and $k_- = (3.4 \pm 0.2) \times 10^{-9}\ dm^3\ mol^{-1}\ s^{-1}$. The kinetic H/D isotope effect is 1.6 ± 0.2 for k_+ and 2.7 ± 0.4 for k_-. The $^1H\text{-}^{17}O$ spin-spin coupling constant (J_{OH}) in H_2O, which is needed for the calculation of the rate constants, was redetermined and the authors

obtained $J_{OH}=81.1$ Hz, in good agreement with previous direct measurements but differing from the commonly adopted value. (46 refs.)

103515 Prototropic charge migration in water. II. Interpretation of nuclear magnetic resonance and conductivity data in terms of model mechanisms. B.Halle, G.Karlstrom (Dept. of Phys. Chem., Univ. of Lund, Lund, Sweden).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1047-73 (July 1983).
For pt.I see ibid., vol.79, pt.7, p.1031-46 (1983). The mechanism of prototropic charge migration (p.c.m.) in water is investigated theoretically, employing topological concepts as well as continuum theory. A system for classification of p.c.m. models is presented. Two models are explored in detail: a one-step model and a concerted model, both of which include non-Markovian features. The two main sources of experimental data on p.c.m. are (1) nuclear spin relaxation, which monitors proton dynamics, and (2) electric conductivity measurements, which probe charge transport. The complementary nature of the information from the two methods makes it possible to test the consistency of postulated p.c.m. models. However, a number of interpretational problems must first be solved. Thus the authors consider the questions of n.m.r.-inactive proton exchanges and water molecule-prototropic charge reencounters, both of which are crucial for a correct interpretation of n.m.r. data. The interpretation of conductivity data hinges on the separation of the prototropic and the diffusive contributions. The authors argue that these contributions are not independent: there is also a significant contribution from cross correlations. The origin of these cross correlations is the non-equilibrium polarization of the aqueous solvent. Several other consequences for the p.c.m. process of non-equilibrium polarization are discussed. A concerted p.c.m. mechanism requires hydrogen-bonded chains of the appropriate polarity. A topological model is presented and the length distribution of such chains is calculated in terms of this model. (62 refs.)

103516 Classical dynamics of the reaction of $S(^3P)$ $O_2(^3\Sigma_g{}^-)$. J.N.Murrell, W.Craven (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England), S.C.Farantos.
Mol. Phys. (GB), vol.49, no.5, p.1077-84 (10 Aug. 1983).
Quasiclassical trajectory calculations have been used to analyse the exchange reaction $S(^3P)$ with $O_2(^3\Sigma_g{}^-)$ using a recently reported potential energy surface for ground state SO_2. The calculated macroscopic rate constants are 1.26×10^{-12} cm^3 molecule^{-1} s^{-1} at 300K and 4.97×10^{-12} cm^3 molecule^{-1} s^{-1} at 450K. These values span the experimental value 2.24×10^{-12} cm^3 molecule^{-1} s^{-1} which was found to be independent of temperature in this range. An alternative method of calculation gives slightly higher values. The finding of a positive activation energy suggests that the potential surface used is imperfect in the long range interaction region. (13 refs.)

103517 Determination of the absolute rate constant for associative ionization in crossed-beam collisions between $Na3^2P_{3/2}$ atoms. R.Bonanno, J.Boulmer, J.Weiner (Dept. of Chem., Univ. of Maryland, College Park, MD, USA).
Phys. Rev. A (USA), vol.28, no.2, p.604-8 (Aug. 1983).
The authors report the determination of the absolute rate constant of $Na_2{}^+$ production by associative ionization collisions between crossed beams of $Na3^2P_{3/2}$ atoms. New measurement techniques greatly improve the accuracy of rate-constant determinations in crossed-beam experiments. They find the rate constant to be $(1.8\pm0.7)\times10^{-11}$ cm^3 sec^{-1}. This value is appreciably larger than many of those previously reported. (14 refs.)

103518 Intermediate product identification for ammonia decomposition at Ni(110). M.Huttinger, J.Kuppers (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany).
Surf. Sci. (Netherlands), vol.130, no.1, p.L277-82 (July 1983).
Ammonia decomposition at Ni(110) has been identified to proceed via $NH_3(ad)\rightarrow NH_2(ad)\rightarrow NH(ad)\rightarrow N+H$. The decomposition activation of NH is determined to be 47 kcal/mol, suggesting an amazing stability of the Ni-NH bond. Decomposition of NH_2 occurs up from about 350K; no kinetic data can be given yet. NH_3 decomposition is found to proceed slower than NH_3 desorption at least below 300K. (12 refs.)

103519 Formation of free fluorine atoms by laser-collisional initiation of the CH_3F+F_2 reaction. V.I.Igoshin, S.Yu.Pichugin (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.205-8 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.370-6 (Feb. 1983).
A kinetic model is developed and analyzed numerically for the reaction CH_3F and F_2 initiated by laser radiation in a mixture having a complex component composition typical of a $DF\text{-}CO_2$ chemical laser. It is shown that an appreciable concentration of free F atoms ($\sim10^{16}$ cm^{-3}) may be formed within a fairly short time (~1 μ sec) at moderate laser pulse intensities (~1 MW/cm^2). These results indicate that this reaction is potentially useful for the development of chemical laser amplifiers initiated by infrared radiation. (7 refs.)

103520 Transient conduction with pyrolysis (approximate solutions for charring of wood slabs). A.M.Kanury (Dept. of Aerospace & Mech. Engng., Univ. of Notre Dame, Notre Dame, IN, USA), D.J.Holve.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.338-43 (May 1982).
The rate of charring of a heated one-dimensional, wood-like solid slab is predicted by solving the transient conduction equation with a phase-change energy sink term. This solution procedure uses an integral method with spatially-linear-temperature profiles. Two types of front-face boundary conditions are considered—prescribed temperature and prescribed heat flux. The back-face is insulated. The prescribed temperature condition leads to the conclusion that for all reasonable exposure temperatures, the slab would only partially char. The maximum char depth is most sensitive to the char conductivity and exposure temperature and less sensitive to the char specific heat and charring endothermicity. Results of the constant flux are in reasonable agreement with the available experimental data both qualitatively and quantitatively. (18 refs.)

82.35 POLYMER REACTIONS AND POLYMERIZATION

103521 Exact correspondence between equilibrium polymerization and multispin Ising models. M.V.Jaric (Phys. Dept., Montana State Univ., Bozeman, MT, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1179-81 (Aug. 1983).
Exact and explicit formulas relating equilibrium polymerization (with excluded volume and polymer rings) and Ising models with even multispin interactions in any dimension are given. It is concluded that equilibrium polymerization either belongs to the Ising universality class or is a first-order transition. Numerical, mean-field evaluations disfavor the latter. (17 refs.)

103522 Long-lived polymer radicals. V. Synthesis of block copolymer by the reaction of living poly(*N*-phenylmethacrylamide) radical with vinyl monomers. T.Sato, Y.Yutani, T.Otsu (Dept. of Appl. Chem., Osaka City Univ., Osaka, Japan).
Polymer (GB), vol.24, no.8, p.1023-30 (Aug. 1983).
When *N*-phenylmethacrylamide (MPMAm) was photopolymerized at room temperature in benzene by using di-*tert*-butyl peroxide as sensitizer, the resulting heterogeneous polymerization mixture was found to contain very stable propagating poly (NPMAm) radical. An ESR study revealed that the living polymer radical reacted easily at room temperature with methyl methacrylate (MMA) yielding persistent poly(MMA) radical. Block copolymer was prepared by the reaction of living poly(NPMAm) radical with MMA and methyl acrylate. Block copolymer constituted 30-60% of the resultant total polymer. Block copolymer was characterized by GPC IR spectroscopy and electron microscopy. (24 refs.)

103523 Polymerization resulting from ultrasonic cavitation. P.Kruus (Dept. of Chem., Carleton Univ., Ottawa, Canada).
Ultrasonics (GB), vol.21, no.5, p.201-4 (Sept. 1983).
Polymerization due to ultrasonically induced cavitation is reported for a number of compounds: bromobenzene, styrene, isoprene, and methyl methacrylate. The molecular weight of the polymethylmethacrylate produced through ultrasound is considerably lower than that due to normal aging. The bromobenzene and styrene products are dark friable solids. The isoprene product has an ultra-violet absorption suggesting a conjugated system of about ten carbon-carbon bonds in length. (12 refs.)

82.40 CHEMICAL KINETICS AND REACTIONS: SPECIAL REGIMES

103524 Boron particle ignition in a restricted thermodynamical equilibrium. D.Meinkohn, J.W.Bergmann (DFVLR, Hardthausen, Germany).
AIAA J. (USA), vol.21, no.7, p.1006-7 (July 1983).
Published experimental evidence leads to the conclusion that a certain particle temperature is the most important prerequisite for boron particle ignition. For particle heating, a model concept of a hybrid gas generator is chosen. The resulting thermal state of the boron particles is characterized by a T^* temperature which is derived for a restricted thermodynamical equilibrium defined by the suppression of chemical contact between the reacting substances of the gas generator and the boron fuel, which is set to be in thermal contact only. A temperature diagram is derived with the help of an existing computer program for thermochemical calculations, in which the ignition readiness of the boron fuel is displayed in terms of a T^* temperature depending on a varied fraction of the boron fuel, which is set to be combusted in the primary process in order to achieve the temperature necessary for ignition of the remainder of the boron. (3 refs.)

103525 Application of fast infrared detectors to detonation science. W.G.Von Holle, R.A.McWilliams (Chem. & Materials Sci. Dept., Univ. of California, Livermore, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.19-26 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
Infrared radiometers have been used to make time-resolved emission measurements of shocked explosives. Instruments of moderate time resolution were used to estimate temperatures in shocked but not detonated explosives. The heterogeneity of the shock-induced heating was discovered in pressed explosives by two-band techniques, and the time-resolved emittance or extent of hot spot coverage indicated a great dependence on shock pressures. Temperatures in moderately shocked organic liquids were also measured. Faster response radiometers with 5 ns rise times based on InSb and HgCdTe photovoltaic detectors were constructed and tested. Preliminary data on reactive shocks and detonations reveals a resolution of the heating in the shock wave and the following reaction. (15 refs.)

103526 Influence of turbulence on the formation of high nonequilibrium concentrations of atoms and free radicals in diffusion flames. V.R.Kuznetsov.
Fluid Dyn. (USA), vol.17, no.6, p.815-20 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.3-9 (Nov.-Dec. 1982).
In the description of chemical reactions between previously unmixed reacting substances, it is frequently assumed that the reaction rate is very large, so that thermodynamic equilibrium is realized at every point of the flow. This assumption makes it possible to reduce the solution of the problem to the description of the concentration field of the inert (not reacting) component. In a number of cases an assumption is inadequate, as small deviations from equilibrium in the temperatures and concentrations of the main combustion products lead to a large change in the concentrations of the free atoms and radicals. Similar problems arise in the analysis of the ignition of fuel by a jet of combustion products. The list of such examples can be extended. Since reactions in a turbulent flow have the main interest, it is natural to consider how the characteristics of turbulence influence the deviations from thermodynamic equilibrium. The present paper is devoted to examination of this question. (7 refs.)

103527 Picosecond laser-spectroscopy measurement of hydroxyl fluorescence lifetime in flames. N.S.Bergano, P.A.Jaanimagi, M.M.Salour (Computer Sci. Dept., MIT, Cambridge, MA, USA), J.H.Bechtel.
Opt. Lett. (USA), vol.8, no.8, p.443-5 (Aug. 1983).
Data are reported for the first known application of picosecond laser spectroscopy to the measurement of collisional quenching rates by time-resolved laser-induced fluorescence in flames. Collisional quenching rates are important for the determination of species concentrations by laser-induced fluorescence. The collisional quenching lifetime following excitation of the $R_2(4)$ $A^2\Sigma^+$ $(\nu'=0)\leftarrow X^2\Pi$ $(\nu''=0)$ transition was measured to be 1.8 nsec in the burned-gas region of an atmospheric-pressure, premixed methane-air flame. (17 refs.)

103528 A theoretical study of ignition in the laminar mixing layer. C.K.Law, H.K.Law (Dept. of Mech. & Nuclear Engng., Northwestern Univ., Evanston, IL, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.329-37 (May 1982).
The structure of the weakly reactive states leading to ignition in the laminar mixing layer flow is studied both analytically and numerically. It is shown that the flow consists of a reactive region and a self-similar frozen region separated by a transitional, nonsimilar frozen region, that the reactive region is intrinsically nonsimilar because of its excessively slow diffusion rate, and that the ignition characteristics are primarily governed by the velocity of the hot stream and therefore minimally dependent on the velocity distribution. Fundamental functional groups are identified, and an explicit prescription is presented, for large activation energy reactions, for the evaluation of the minimum stream-wise distance to achieved ignition. (10 refs.)

103529 The acceleration of fast deflagration waves. D.S.Stewart, G.S.S.Ludford (Dept. of Theoretical & Appl. Mech., Talbot Lab., Univ. of Illinois, Urbana, IL, USA).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.291-302 (1983).
Stewart and Ludford gave a theory of steady deflagration waves based on an ignition-temperature model obtained from Arrhenius kinetics. They were able to describe analytically the structure of deflagration waves for the entire range of wave speeds between zero and the maximum (Chapman-Jouget) value. In this paper the authors construct a quasi-steady theory of flame acceleration based on that work, which can predict the acceleration response of a preexisting flame to quite arbitrary hydrodynamic disturbances in the limit of small heat release during the combustion. Explicit formulas and criteria are developed. In particular, they find that an unsteady deflagration wave can travel at speeds in excess of the Chapman-Jouget value, and even at arbitrarily large supersonic values. (7 refs.)

103530 Design of a microcomputer-based data acquisition system for pulse combustion research. G.Border, D.Border (Digital Automation Associates Inc., Bowling Green, OH, USA), W.H.Thrasher.
23rd Midwest Symposium on Circuits and Systems, Toledo, OH, USA, 4-5 Aug. 1980 (North Hollywood, CA, USA: Western Periodicals 1980), p.132-6
Pulse combustion technology appears to offer the potential for significant fuel savings in residential heating systems. Utilizing natural gas as a fuel, the pulse combustion furnace replaces a conventional upflow furnace with dramatically improved efficiency. Long-term field studies of pulse combustion furnace operation are made particularly difficult, however, by the relatively sophisticated nature of the furnace control system. This paper details the development of a portable microcomputer-based data acquisition system for use in a pulse combustion research program. This system was used for dedicated and extended monitoring of pilot pulse combustion furnace installations across the North American Continent during the winter of 1979-80. Operating unattended for days and even weeks, the system recorded key operating parameters on industry-standard media for later analysis on larger laboratory-based computer systems. (6 refs.)

103531 An experimental apparatus for chemiluminescence and its characteristics. H.Inouye, T.Ishikawa, H.Sasaki (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).
Bull. Res. Inst. Sci. Meas. Tohoku Univ. (Japan), vol.31, no.2-3, p.121-47 (1982). In Japanese.
An experimental apparatus on the basis of a beam-cell method was set up for studying chemiluminescence in ion-molecule collisions. Preliminary experiments on chemiluminescent reactions for C^{2+}-H_2, N^+-CO, and O^+-C_2H_2 systems revealed as an excellent performance ability of the apparatus. Characteristics of some ion beams produced in this apparatus are described in full detail. (10 refs.)

103532 Chemiluminescent reaction between alkali dimers and oxygen molecules. H.Figger, W.Schrepp, Xu-hui Zhu (Max-Planck-Inst. fur Quantenoptik, Garching, Germany).
J. Chem. Phys. (USA), vol.79, no.3, p.1320-5 (1 Aug. 1983).
The reaction of alkali dimers with oxygen molecules was studied in a crossed-beam experiment. Weak luminescence from the crossing zone was observed. It was found that it was predominantly emitted by the electronically excited products of the reactions $M_2+O_2\rightarrow MO_2+M^*$ and $M_2+O_2\rightarrow MO_2^*+M$ (*=electronic excitation). Lower limits for the dissociation energies between M and O_2 in the product molecules were derived from the cut-off wavelengths of the continuous chemiluminescence spectra observed. They are found to be consistent with the values calculated using an ionic model for the product molecule MO_2. (29 refs.)

103533 Visible chemiluminescence from the high-pressure reactions of F atoms with CH_3I and CH_2I_2. H.S.Braynis, J.C.Whitehead (Dept. of Chem., Univ. of Manchester, Manchester, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1113-21 (July 1983).
Visible chemiluminescence in the region 400-890 nm was measured from the high-pressure (*ca.* 0.4 mbar) reactions of F atoms with CH_3I and CH_2I_2. Emission was observed from electronically excited $IF^*(B)$, $HCF^*(\tilde{A})$ and $CH^*(A)$ and from vibrationally excited $HF^{\ddagger}(X)$. There are essentially no differences in the observed chemiluminescence spectra from the two reactions and no major dependence on the source of F atoms (discharge of F_2+He or CF_4). A possible mechanism for the formation of IF* involves the intermediate species CH_3IF or CH_2I_2F. It is suggested that HCF*, CH* and $HF^{\ddagger}$ may be formed by the reactions of F or F_2 with CH or CH_2 and such a mechanism may be applicable to all high-pressure fluorine reactions with substituted methanes. Some studies of chemiluminescence in other high-pressure systems ($F+CH_3Br$, CH_3OH, ICl and HI) are also reported. (29 refs.)

82.45 ELECTROCHEMISTRY AND ELECTROPHORESIS

(see also 66.10 Ionic conduction in liquids; for electro-osmosis, see 82.65)

103534 The potential of zero charge of oriented single-crystal RuO_2 in aqueous electrolytes. M.Tomkiewicz, Y.S.Huang, F.H.Pollak (Dept. of Phys., Brooklyn Coll., City Univ. of New York, New York, NY, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1514-18 (July 1983).
The impedance of 5 virgin faces of single crystal RuO_2 was measured over the frequency range of 1-10^6 Hz, in three electrolytes-10^{-3}M and 1M

Na_2SO_4 and 10^{-3}M KF. The fastest relaxing capacitive element was identified, and its values measured as a function of the electrode potential. A major contribution to this capacitance is due to the double layer capacitance. The potential of zero charge in 10^{-3}M Na_2SO_4 was measured for the five crystalline faces. The variations of the potential of zero charge with the crystalline faces are small. 'Average' value is ($\sim 0.09 \pm 0.1$) V vs. SCE. The potential of zero charge correlates well with the reported work functions of RuO_2 and Ru metal. (27 refs.)

103535 Silver sulfide based glasses. II. Electrochemical properties of GeS_2-Ag_2S-AgI glasses: transference number measurement and redox stabiity range. E.Robinel, A.Kone, M.J.Duclot, J.L.Souquet (Lab. d'Energetique Electrochimique, Saint Martin d'Heres, France).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.59-70 (Aug. 1983).
For pt.I see ibid., vol.57, p.49 (1983). The transference numbers of the species responsible for current transport in GeS_2-Ag_2S-AgI glasses, have been determined. Tubandt's method shows that the transference number of the Ag cation is equal to 1 (to within 2%). By electrochemical semipermeability flux measurement, the electronic transference number was estimated to be less than 10^{-8}, and by triangular voltammetry, the transference number of the iodide anion at approximately 10^{-5}. Triangular voltammetry can also be used to measure the redox stability range, which is about 3 V for current densities of 0.1 mA/cm^2. This high value is due to the low mobility of the anions below the glass transition temperature. (21 refs.)

103536 Synthesis of reduced complex oxides of molybdenum by fused salt electrolysis. W.H.McCarroll, C.Darling, G.Jakubicki (Chem. Dept., Rider Coll., Lawrenceville, NJ, USA).
J. Solid State Chem. (USA), vol.48, no.2, p.189-95 (1 July 1983).
Fused salt electrolysis has been used to prepare a number of reduced oxides of molybdenum with lanthanum, neodymium, and yttrium in single crystal or oriented polycrystalline form. The average valence of molybdenum in the various compounds ranged from 5.67 to 3.50. Previously unreported compounds include $La_5Mo_4O_{16}$ (triclinic a=5.64 Å, b=20.70 Å, c=5.64 Å, α=86.55°, β=90.0°, γ=93.45°); $La_2Mo_2O_7$ (orthorhombic, a=12.19 Å, b=6.05 Å, c=3.87 Å); $LaMo_2O_5$ (hexagonal, a=8.378 Å, c=19.26 Å). In addition, single crystal specimens have been prepared of Y_2MoO_5, $Ln_5Mo_3O_{16}$ (Ln=La, Nd) and metal atom cluster compounds of the $A_2Mo_3O_8$ type (A=Mg, Co, Ni, Zn). (28 refs.)

103537 A mathematical model of isotachophoresis. M.Yu.Zhukov, V.I.Yudovich (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.918-20 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.334-8 (Nov. 1982).
A mathematical model of isotachophoresis, used to separate a mixture of electrolytes by an electric field is constructed. In the diffusionless approximation the model is reduced to a system of quasilinear equations of the hyperbolic type. A generalized solution of the Cauchy problem for an arbitrary piecewise-constant distribution of electrolyte concentrations is investigated by the methods of Rozhdestvenskii and Yanenko (1978). It is shown that the well known Kohlrausch relations for the concentrations of neighboring zones, which lie at the foundation of the stationary theory of isotachophoresis, are a consequence of the Hugoniot conditions at discontinuities. The results obtained agree well with experiment. (8 refs.)

103538 Investigation of the relationship between the nature of an organic compound and its adsorbability on platinum. Influence of the potential of the platinum electrode on the mechanism of the adsorption and reduction of aromatic nitro compounds. N.V.Andreev, G.Horanyi, V.E.Kazarinov (Central Res. Inst. of Chem., Acad. of Sci., Budapest, Hungary).
Sov. Electrochem. (USA), vol.18, no.10, p.1160-6 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1305-11 (Oct. 1982).
With the aid of the combined use of radioisotopic and electrochemical methods it has been shown that in the case of the reduction of aromatic nitro compounds, either the nitro group or the nitro group and the aromatic ring in the organic compound undergoes reduction, depending on the electrode potential. (9 refs.)

103539 Electric conductivity of ammonium-selective membranes containing neutral complex formers. N.V.Rozhdestvenskaya, O.K.Stefanova (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1226-32 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1379-85 (Oct. 1982).
Data are cited on the electric conductivity of ammonium-selective membranes containing neutral complex formers, as well as on the dynamics of the change in this quantity during contact of the membranes with aqueous solutions of NH_4Cl. The principles detected are explained on the basis of concepts of the formation of a dispersed aqueous phase in the membrane. (8 refs.)

103540 Temperature dependence of adsorption on mercury in the carboxylic acid series. F.I.Danilov, S.A.Panasenko, I.G.Shatukhin (F.E. Dzerzhinskii Chem. Engng. Inst., Dnepropetrovsk, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1266-9 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1420-3 (Oct. 1982).
The authors studied the effect of temperature (293 to 313±0.1K) on the adsorption of valeric, caproic, caprylic, and isovaleric (t-butanecarboxylic) acid on the DME from 0.8 N Na_2SO_4+0.2 N H_2SO_4 as an electrolyte, so as to extend knowledge of values of thermodynamic adsorption parameters and to elucidate the possible nature of attractive interaction. 82.50 PHOTOCHEMISTRY AND RADIATION CHEMISTRY

(see also 33.50 Fluorescence, phosphorescence; radiationless transitions)

103541 Solvent structure effects on electron thermalization ranges in water-alcohol mixed solvents; preferred E_{Amax} values for $e^-{}_s$ in alchols. A.-D.Leu, K.N.Jha, G.R.Freeman (Chem. Dept., Univ. of Alberta, Edmonton, Alberta, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1115-19 (June 1983).
Addition of 2 mol.% of an alcohol to water or of 1 mol.% of water to an alcohol increases the value of $G_{fi}\varepsilon_{max}(e^-{}_s)$ above that in the pure solvent. The effect is attributed mainly to an increasing free ion yield G_{fi}. The increase of G_{fi} correlates with a 'stiffening' of the solvent molecular rotational motions and a corresponding lower rate of energy loss by the epithermal electrons to dipole rotations. Thus the increase of G_{fi} is mainly attributed to a larger electron thermalization range b_{GP}. The value of $G_{fi}\varepsilon_{max}$ passes through a maximum at 2 mol.% of an alcohol in water; the maximum increases in the order methanol<ethanol<1-propanol as additive. The solvent 'stiffening' effect of these solutes increases in the same order. Some of the published values of E_{Amax} and $W_{1/2}$ for solvated electrons in alcohols appear to be too low. A set of preferred values is reported. (41 refs.)

103542 Quantum-chemical model for the photoisomerization of protonated Schiff bases of formaldehyde and acrolein. F.Dietz, A.Tadjer, N.Tyutyulkov (Section of Chem., Karl-Marx Univ., Leipzig, Germany).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.120-1 (29 July 1983).
By means of potential energy curves in the excited states the authors discuss the mechanism of trans-cis isomerization of protonated imine and enimine. For the higher homologues isomerization about the C=N bond is highly improbable. (11 refs.)

103543 Quantum interference in the IR-multiphoton excitation of small asymmetric-top molecules: ozone. M.Quack, E.Sutcliffe (Lab. fur Phys. Chem., ETH Zurich, Zurich, Switzerland).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.167-72 (29 July 1983).
Quantum dynamical calculations for the IR-multiphoton excitation and dissociation of ozone are presented using realistic rovibrational spectral structures from recent high-resolution spectroscopic studies. The time-dependent level populations, the frequency-dependent excitation and the intensity dependence of the rate coefficient, for IR-photochemical reaction are discussed in terms of quantum interference effects. (30 refs.)

103544 A pulse radiolysis study of the formation of the XeBr exciplex in electron beam irradiated xenon-bromine mixtures. R.Cooper, W.A.Mulac (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.217-20 (5 Aug. 1983).
Nanosecond pulse radiolysis studies of xenon-bromine mixtures reveals that (XeBr)* emission is produced by two distinct processes. At very low electron beam intensities one process (ion recombination) is slowed down sufficiently to permit unambiguous kinetic analysis of the second process (energy transfer from xenon excited states to Br_2). (3 refs.)

103545 Tritium separation by laser multiple-photon dissociation of $CDTCl_2/CD_2Cl_2$ mixture. A.Yokoyama, K.Suzuki, G.Fujisawa, N.Ishikawa, M.Iwasaki (Div. of Chem., JAERI, Ibaraki, Japan).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.221-4 (5 Aug. 1983).
Selective multiple-photon dissociation of $CDTCl_2$ in CD_2Cl_2 was studied using a TEA CO_2 laser. The dissociation rate of $CDTCl_2$ had a maximum value at 927 cm^{-1} (P(38) line) irradiation. The frequency agreed with the calculated ν_7 vibrational frequency (929 cm^{-1}) of $CDTCl_2$ within the accuracy of the

calculation. The tritium enrichment factor β_{prod} was obtained to be 29_{-15}^{+156} at 3 Torr total pressure and at 907.8 cm^{-1} irradiation. (15 refs.)

103546 Classical trajectory study of the effects of parent-molecule bending and overall rotation in polyatomic direct photofragmentation. Model $ICN+h\nu \rightarrow CN+I$. M.D.Pattengill (Dept. of Chem., Univ. of Kentucky, Lexington, KY, USA).
Chem. Phys. (Netherlands), vol.78, no.2, p.229-33 (15 July 1983).
The classical trajectory method has been used to investigate the effects of parent-molecule bending and overall rotation on product state attributes in the direct photofragmentation of model ICN. Comparisons with previous collinear, rotationless studies indicate that product CN vibrational distribution can be profoundly affected by permitting ICN to bend. Inclusions of ICN overall rotation (in addition to bending) produces CN vibrational distributions essentially identical to those obtained with the inclusion of bending alone. Rotational distributions (for individual CN product vibrational states) indicate substantial CN rotational excitation. As in the case of the vibrational distributions, addition of overall rotation to ICN bending produces little, if any, effect. Additionally, for the energy range investigated, the CN product rotational distributions show no marked qualitative energy dependence. (7 refs.)

103547 Kinetic models for stilbene photoisomerisation: comparison of theory and experiments. B.M.Ladanyi (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA), G.T.Evans.
J. Chem. Phys. (USA), vol.79, no.2, p.944-52 (15 July 1983).
Torsional correlation times for trans to cis isomerisation of stilbene in solution are calculated using Fokker-Planck and diffusional models for the barrier crossing process. Hydrodynamic interactions and the solvent-dependent potential of mean force are incorporated into the calculations. Both convective effects and hydrodynamic interactions are found to have a significant impact on the isomerisation rate of stilbene in alkane solvents near room temperature. It is found that the potential barrier between the trans and 90° states definitely has to be below 1200 cm^{-1}, the latest experimental value of this quantity, in order to explain the observed photoisomerisation rate. The dependence of the rate on friction is calculated and various improvements to the authors' model and their relative importance are discussed. (43 refs.)

103548 High vibrational overtone photochemistry of cyclobutene. J.M.Jasinski, J.K.Frisoli, C.B.Moore (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1312-19 (1 Aug. 1983).
Direct single-photon excitation of high CH stretching overtone transitions has been used to induce the isomerization of cyclobutene to 1,3-butadiene. Values of the unimolecular isomerization rate constant $k(E)$ have been measured as a function of energy and overtone transition by studying the pressure dependence of the photoisomerization rate constant. The values of $k(E)$ depend on the total energy and do not show any observable dependence on the type of CH overtone transition excited. The values of $k(E)$ are in reasonable quantitative agreement with RRKM calculations. (31 refs.)

103549 Nonequilibrated energy distribution in polyatomic molecules: the infrared MPD of cyclobutanone. P.John, M.R.Humphries (Dept. of Chem., Heriot-Watt Univ., Edinburgh, Scotland), R.G.Harrison, P.G.Harper.
J. Chem. Phys. (USA), vol.79, no.3, p.1353-9 (1 Aug. 1983).
The TEA CO_2 infrared MPD of cyclobutanone, on irradiation of the ν_{24} fundamental mode, has been investigated as a function of incident fluence F_i, wavelength and pressure. Dissociation proceeds via two molecular routes; the first yields ethylene plus ketene CH_2CO, and the second cyclopropane and CO plus minor amounts of propylene. The branching ratio $R \equiv [C_2H_4]/[C_3H_6]$ increases dramatically at pressures less than ~3 Torr from the high pressure thermal limit. This nonthermal feature is most pronounced at low F_i. The average number of quanta absorbed per molecule $\langle n \rangle$, measured by pyroelectric and optoacoustic detection, is independent of cyclobutanone pressure between 0.1 and 10.0 Torr. $\langle n \rangle$ varies linearly with F_i in the range investigated 0.2-2.0 J cm^{-2}. An explicit formulation of the infrared MPD process is presented based on a truncated s-fold degenerate harmonic oscillator approach. Vibrational energy transfer is incorporated via v-v bimolecular collisions. The predicted dependence of R on pressure is in good agreement with the experimental data presented herein. Moreover, the observed linear dependence of $\langle n \rangle$ with F_i, and its independence with respect of pressure, is also borne out by this theory. (26 refs.)

103550 Photofragment spectroscopy and dynamics of the visible photodissociation of ozone. D.S.Moore, D.S.Bomse, J.J.Valentini (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1745-57 (15 Aug. 1983).
The authors report collision-free coherent anti-Stokes Raman scattering (CARS) spectra of the O_2 fragment formed in the photodissociation of ozone at 532 and 578 nm. From these spectra they have extracted the nascent electronic, vibrational, rotational, and translational energy distributions of the photofragments. The O_2 fragment is produced only in the ground ${}^1\Sigma_g{}^-$ electronic state, even though the ${}^1\Delta_g$ excited state is energetically allowed. High ($J \approx 23$ to 51) rotational states in the first five vibrational levels of $O_2({}^3\Sigma_g{}^-)$ are populated in the photodissociation. For both photolysis wavelengths most of the available energy, 65%-67%, appears in translation, while 15%-18% is in rotation, and 17%-18% is in vibration. These energy distributions are discussed in terms of simple models of the dissociation dynamics. (44 refs.)

103551 Infrared laser multiple-photon dissociation of $CDCl_3$ in a molecular beam. I.P.Herman, F.Magnotta (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), R.J.Buss, Y.T.Lee.
J. Chem. Phys. (USA), vol.79, no.4, p.1789-94 (15 Aug. 1983).
Pulsed CO_2 laser multiple-photon dissociation of $CDCl_3$ was examined in a molecular beam using 11 μ radiation. The only observed dissociation channel was hydrogen chloride elimination (>99.1%), with no evidence of simple chlorine atom cleavage (<0.9%). Implications for isotope separation are discussed. (23 refs.)

103552 Magnetic field effects on photosensitized electron transfer reactions in the presence of TiO_2 and CdS loaded particles. J.Kiwi (Inst. de Chimie Phys., Ecole Polytech. Federale, Lausanne, Switzerland).
J. Phys. Chem. (USA), vol.87, no.13, p.2274-6 (23 June 1983).
Magnetic fields have a pronounced effect on a wide variety of reactions under UV and visible light leading to H_2 production from water. Application of moderate magnetic fields leads to a variation of the fraction of radicals that interact with a heterogeneous catalyst. The rate of chemical reaction depends on the strength of a steady magnetic field and is observable only under specific conditions. (22 refs.)

103553 Steady-state kinetic studies on the exciplex formation between indoles and n-butyl alcohol. T.Tamaki (Res. Inst. for Polymers & Textiles, Ibaraki, Japan).
J. Phys. Chem. (USA), vol.87, no.13, p.2383-6 (23 June 1983).
The changes in the steady-state-fluorescence intensities of indole (IND) and 3-methylindole (3-MeI) as a function of n-butyl alcohol (BuOH) concentration ($<5 \times 10^{-2}$ M) are subjected to kinetic analysis by computer simulation with the kinetic scheme describing stepwise photoassociation of exciplex partners upi to a 1:2 stoichiometry. The simulation is gratifying for indole as well as for 3-methylindole. Except for the stability of a 1:1 complex, the kinetic behavior of specific interaction of indole with n-butyl alcohol is similar to that for 3-methylindole. The increased stability of the 1:1 complex of 3-methylindole is explained in terms of an increase in the excited state basicity at C-3 of this compound. (19 refs.)

103554 A comparison of the carbon-13 hyperfine constants of carboxylated cyclohexadienyl and hydroxycyclohexadienyl radicals. R.N.Sangster, K.P.Madden, R.H.Schuler (Dept. of Chem., Univ. of Notre Dame, Notre Dame, IN, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2395-8 (23 June 1983).
${}^{13}C$ ESR spectra of the H atom adducts to pyromellitic and benzenepentacarboxylic acids have been observed. Comparison of the ${}^{13}C$ hyperfine constants with those previously obtained for the OH adducts shows essentially identical values at the carboxyl positions and significant differences for the ring atoms only at the C_3 and C_6 positions. The spin density distribution in the π system is clearly not affected to any significant extent by OH substitution. In spite of this the ${}^{13}C$ hyperfine coupling constants for C_6, the site of addition, are 13 and 23% lower, respectively, in the OH adducts. This finding is at variance with correlation of ${}^{13}C$ couplings strictly in terms of the local and adjacent π spin densities. It is suggested that the differences noted, and the related drop of ~35% in the proton hyperfine constants at C_6, result mainly from the loss of symmetry in the OH substituted radicals. (12 refs.)

103555 The concentration process in the formation of development centres in silver halide microcrystals. J.W.Mitchell (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).
J. Photogr. Sci. (GB), vol.31, no.4, p.148-57 (July-Aug. 1983).
Discusses the processes whereby silver atoms are concentrated at a few sites during exposure to form development centres in silver halide emulsion grains. Two models are used. With the first model, the chemically sensitized grain has small surface monolayer islands of Ag_2S molecules with AG_2 molecules adsorbed at vacant sites around their edges, and exposure results in the photo-oxidation of these Ag_2 molecules with liberation of conduction electrons and charge-compensating interstitial silver ions. With the second model, the islands of Ag_2S molecules have co-adsorbed (Ag,Au)S and Au_2S molecules in a random distribution and no adsorbed Ag_2 molecules. Ag_2S molecules are now photo-oxidized during exposure, and $AuAg_3{}^+$ and $Au_2Ag_2{}^+$ concentration specks are formed by one effective photochemical event. A quantitative theory is presented which predicts the maximum dimension of a silver halide grain in which an efficient concentration process can operate. (79 refs.)

103556 Photosensitization and photostabilization of isotactic poly(1-butene) film with triazine complexes. R.Chandra (Dept. of Chem., Delhi Coll. of Engng., Delhi, India).
Polym. Bull. (Germany), vol.9, no.8-9, p.445-9 (March 1983).
The authors describe the results of the 3-(o-carboxyphenyl)-1-phenyltriazine-N-oxide-sensitized and copper (II) bis-3-(o-carboxyphenyl)-1-phenyltriazine-N-oxide-stabilized photodegradation of isotactic poly(1-butene) film in air at a temperature range of 267-313K with a light intensity flux 2.38×10^{-9} einsteins sec^{-1} cm^{-2}. The degradation was followed by viscometry, potassium ferri-oxalate actinometry and by measuring carbonyl index. The intrinsic viscosity, quantum yield and carbonyl index depend on several factors, i.e. temperature and triazene concentration. (8 refs.)

103557 Determination of picosecond relaxation times of bleachable dyes by the method of cross polarizers. M.A.Vasil'eva, V.B.Gul'binas, V.I.Kabelka, A.V.Masalov, V.P.Syrus (Inst. of Phys., Acad. of Sci., Vilnius, Lithuanian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.233-5 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.415-19 (Feb. 1983).
A background-free method is proposed for the determination of the time constants of fast relaxation of bleachable dyes. The method utilizes exciting and probe ultrashort light pulses. The absence of background is ensured by the use of crossed polarizers. The results are given of a determination (by the new method) of picosecond relaxation times of bleachable dyes of the kind used for mode locking of neodymium laser radiation. These results are in good agreement with the data obtained by the familiar absorption method. (11 refs.)

103558 Regressive of the latent image in carboxyl-containing cellulose materials under the influence of an electric field. I.N.Ermolenko, T.G.Lazareva.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.173-5 (May-June 1983). In Russian.
The authors study the effect of an electric field on the photosensitivity and regression of latent image centres formed by the action of UV radiation in cellulose materials containing carboxyl groups. The observed effect is shown to be correlated with the process of dielectric polarisation in the electric field. (5 refs.)

103559 Visible light sensitisation by means of cyanine dyes of polymer compositions based on diphenyl benzylamine and carbon tetrabromide. A.D.Grishina, A.V.Vannikov, T.N.Galiullina, M.A.Alperovich, B.I.Shapiro.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.175-81 (May-June 1983). In Russian.
The authors investigate the spectral sensitisation, using cyanine dyes with different redox potential, of compositions containing polyvinyl chloride, diphenyl benzylamine and carbon tetrabromide. It is shown that cyanine dyes having $E^1/_3Ox$ value for diphenyl benzylamine are effective sensitisers. (4 refs.)

103560 Concerning the role of Ag^+ ions in a photographic process with physical development on thin TiO_2 layers. Yu.V.Nechepurenko, G.A.Ragoisha, V.G.Sokolov, G.A.Branitskii.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.181-4 (May-June 1983). In Russian.
The authors examine the results of an investigation of the photographic and photoelectrochemical characteristics of thin TiO_2 layers containing at the film surface 10^{-9} to 10^{-6} g/cm^2 of Ag^+ ions. Two maxima are found in the curves of photosensitivity dependence on the concentration of adsorbed Ag^+ ions. The sensitisation of TiO_2 of Ag^+ photoreduction and the effect of photoactivation of TiO_2-Ag structures in relation to image formation in Ag-containing TiO_2 layers are discussed. (8 refs.)

103561 Concerning a decrease in penetration by oxygen of polymer layers with azides during irradiation with light. V.M.Treushnikov, A.M.Yanin.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.185-90 (May-June 1983). In Russian.
The authors determine the diffusion coefficients (D) of oxygen on the basis of a kinetic analysis of photochemical azide oxidation reactions in cyclized natural rubber and polystyrene. D in polymer layers without azides is found to be close to that determined by direct methods. In layers with azides present D is

shown to be 2 orders less. It is concluded that during irradiation processes occur which lead to a sharp decrease in permeability to molecular oxygen. (9 refs.)

103562 Mechanism of the initial stage of the surface photochemical process of the microcrystals of low-sensitivity photographic layers. A.N.Latyshev, K.V.Chibisov.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.209-12 (May-June 1983). In Russian.
The authors discuss the results of various previously published investigations into the detailed mechanism of the photochemical process at the surface of Ag halide microcrystals in low-sensitivity photographic layers. The role of ion and atom adsorption, and of dislocations at the surfaces of the microcrystals are examined. (23 refs.)

103563 Spectrophotometric investigation of the process of colour centre rearrangement during the fixation of a photochemically coloured emulsion. S.F.Chernov, V.V.Shcherbukhin, E.P.Senchenkov, E.A.Galashin.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.214-17 (May-June 1983). In Russian.
The authors discuss the absorption spectra of photochemically coloured ultra-fine grained emulsions of AgBr subject to fixation in a 0.15 M ammonia solution. The position of the maxima in the absorption spectra are determined by mathematical programming. (7 refs.)

103564 Magnetic effects in glyoxal photodecomposition. N.I.Sorokin, N.M.Bazhin (Inst. of Chem. Kinetics & Combustion, Novosibirsk, USSR), G.G.Eremenchuk.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.181-5 (29 July 1983).
The effect of a magnetic field (0-8 kG) on the fluorescence and product yield of glyoxal photolysis induced by 436 nm light has been investigated. Both the fluorescence and photolysis are quenched by a magnetic field. The maximum value of the effect on the fluorescence is 40%, that on the reaction is 15% at a glyoxal pressure of 0.05 Torr ($H=3$ kG). The pressure dependence of the magnetic effect has a maximum. The phenomena observed have been interpreted within a kinetic model. The rate constant of ${}^1A_u \rightarrow {}^3A_u$ collisional transition has been assumed to depend on yield strength and glyoxal pressure. (27 refs.)

103565 Delayed fragmentation of acetonitrile upon short-pulse UV irradiation: possible role of long-lived superexcited intermediates. B.B.Craig, W.L.Faust (Naval Res. Lab., Washington, DC, USA), R.G.Weiss.
J. Chem. Phys. (USA), vol.79, no.3, p.1286-96 (1 Aug. 1983).
The authors have studied fragment emission in the spectral range 200-900 nm, following short-pulse UV excitation (25 ps, 266 nm, 0.2-10 mJ) of acetonitrile. The dominant components of emission are the CN $B^2\Sigma^+ \rightarrow X^2\Sigma^+$ violet system and the C_2 $d\ {}^3\Pi_g \rightarrow a^3\Pi_u$ Swan system. Emissive CH and NH are also observed. Each of these diatomics is produced with a pressure-dependent rate. An instrumental risetime of 0.6 ns enabled study of the rise and fall of violet and of Swan emission over the pressure range 0.27-10 Torr. The formation kinetics suggest that there are long-lived intermediates to the violet and Swan emissive populations. These precursors are not observed in emission. They have zero-pressure lifetimes of 20 to 30 ns; in collision with the parent they are removed with large bimolecular rate constants ($<10^{-9}$ cm^3 s^{-1}). With the use of isotopically labeled acetonitrile, the authors have established that major fractions of CN $B^2\Sigma^+$ and of C_2 $d^3\Pi_g$ are formed intramolecularly. Further, two channels of intramolecular CN $B^2\Sigma^+$ production are recognized. They share a common risetime, which may indicate a common precursor. The preferred channel retains the CN association of the parent. In the other channel, the carbon atom originates in the methyl group of the parent, suggesting rearrangement within an intermediate. The authors believe that the precursors are superexcited or highly excited species $C_2H_nN^{**}$ ($0 \leq n \leq 3$). (59 refs.)

103566 Simultaneous one- and two-photon processes in the photodissociation of NCNO using a tunable dye laser. I.Nadler, J.Pfab, G.Radhakrishnan, H.Reisler, C.Wittig (Chem. Dept., Univ. of Southern California, Los Angeles, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2088-90 (15 Aug. 1983).
State-to-state studies of the photodissociation of polyatomic molecules can provide valuable information regarding fragment yields and quantum state distributions. Such information is often prerequisite to understanding the dynamics of dissociation and the nature of the excited potential surface(s). The authors report data indicating the NCNO will be a very important test molecule for the theoretical models of photodissociation dynamics. It has the desirable characteristics of nitroso compounds, a low C-NO dissociation energy (29 kcal mol.$^{-1}$), an $\pi^* \leftarrow n(S_1 \leftarrow S_0)$ transition in the region 500-880 nm (which in some nitroso compounds has been shown to be predissociative), and an NO fragment which can be monitored by laser induced fluorescence (LIF). In addition, the CN fragment can be easily detected by LIF, and thus E, V, R, T energy distributions in both fragments can be determined. (12 refs.)

103567 The preparation and selected properties of Mg-doped p-type iron oxide as a photocathode for the photoelectrolysis of water using visible light. C.Leygraf, M.Hendewerk, G.Somorjai (Materials & Molecular Res. Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
J. Solid State Chem. (USA), vol.48, no.3, p.357-67 (15 July 1983).
Stable Mg-doped iron oxides that exhibit *p*-type character have been synthesized. These have been utilized in the form of sintered polycrystalline disks for the photodissociation of water. The authors report the influence of sintering temperature, surface oxygen deficiency, Mg-doping level, and solution chemistry on the photoactivity of the Mg-doped iron oxide photocathodes. (21 refs.)

103568 Spatial-anisotropy and polarized-atomic-fluorescence measurements following molecular photodissociation. H.Hemmati, W.M.Fairbank,Jr., P.K.Boyer, G.J.Collins (Colorado State Univ., Fort Collins, CO, USA).
Phys. Rev. A (USA), vol.28, no.2, p.567-76 (Aug. 1983).
A study has been made of the photodissociation of the molecules NaI, TlI, $HgBr_2$, and $PbBr_2$ by polarized 193-nm ArF laser light. A significant degree of polarized fluorescence was measured from excited photoproducts Tl and HgBr. No polarization was observed in the Na and Pb fluorescence, while the Hg polarization was small. For Tl the spatial anisotropy of the dissociated atoms was also measured by atomic absorption, yielding an asymmetry parameter value of $\beta=1.2$. The best current explanation for the polarized Hg and Tl emission is that fine-structure and hyperfine-structure magnetic substates, respectively, are preferentially populated by the dissociation process. (14 refs.)

103569 Dissociation of UF_6 molecules involving excitation of combination modes by NH_3-N_2 laser radiation. V.G.Averin, M.Akhrarov, G.S.Baronov, B.I.Vasil'ev, A.Z.Grasyuk, M.G.Morozov, E.P.Skvortsova, A.B.Yastrebkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.189-94 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.346-53 (Feb. 1983).
The results are presented of a study of the dissociation of UF_6 molecules as a result of simultaneous interaction of resonant (NH_3-N_2 laser) and quasiresonant (CO_2 laser) infrared fields with $\nu_3+\nu_5$ (821.827 cm^{-1}) and $\nu_1+\nu_4$ (852.8 cm^{-1}) combination vibrations. The method used to record the dissociation process (observation of the HF* luminescence) made it possible to determine its rate in a single illumination pulse. It was found that two-frequency infrared-infrared excitation of the combination vibrations of the UF_6 molecule resulted in efficient multiphoton dissociation. A study was made of the influence on the dissociation rate of the intensity and frequency of the infrared field. Mass-spectrometric measurements failed to detect isotopic selectivity of the dissociation process. (12 refs.)

(see also 05.70 Thermodynamics)

103570 Note on the prediction of the enthalpy of formation of solid compounds of the transition and noble metals with chalcogens and halogens. A.K.Niessen (Philips Res. Labs., Eindhoven, Netherlands).
High Temp.-High Pressures (GB), vol.14, no.6, p.649-51 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
It is shown that the model proposed by Miedema and coworkers (1980) to predict the enthalpy of formation of metal alloys can also be applied in principle to transition-metal chalcogenides and halides when the charge transfer to the atomic cells of these elements is limited. (6 refs.)

103571 Chemical equilibrium calculations of tungsten-halogen systems. J.A.Sell (Phys. Dept., General Motors Res. Labs., Warren, MI, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4605-13 (Aug. 1983).
The performance of the compound bromotrifluoromethane ($CBrF_3$) as a tungsten-halogen bulb fill gas was evaluated theoretically by chemical equilibrium calculations. It was found to be an ideal fill gas in terms of maintaining clear bulb walls and redepositing evaporated tungsten on hot spots in the filament. The calculations were done at different $CBrF_3$ and water concentrations. The compounds most responsible for tungsten transport were identified; fluorine compounds of tungsten dominate over bromine compounds. Finally, $CBrF_3$ is compared to other possible fill gases such as CBr_2F_2, CBr_3F, CBr_4,. and also HBr, since HBr is presently used commercially. (30 refs.)

103572 Thermodynamics of unsymmetrical electrolyte mixtures. Enthalpy and heat capacity. K.S.Pitzer (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2360-4 (23 June 1983).
There is a purely electrostatic contribution to the thermodynamic properties of electrolytes for the mixing of ions of different charge but the same sign. The previous treatment, which was limited to activity or osmotic coefficients, is extended to enthalpies and heat capacities and applied to the measurements of R.B. Cassel and R.H. Wood (1974) on the heat of mixing in the systems $NaCl-BaCl_2$ and $NaCl-Na_2SO_4$. (20 refs.)

103573 Thermodynamics of the unsymmetrical mixed electrolyte $HCl-LaCl_3$. R.N.Roy, J.J.Gibbons (Dept. of Chem., Drury Coll., Springfield, MO, USA), J.C.Peiper, K.S.Pitzer.
J. Phys. Chem. (USA), vol.87, no.13, p.2365-9 (23 June 1983).
The contribution of higher order electrostatic terms (beyond the Debye-Huckel approximation) has been investigated for the system $H^+-La^{3+}-Cl^--H_2O$. EMF measurements were carried out on solutions at temperatures from 288.15 to 318.15K, and at ionic strengths from 0.1 to 5.0 mol kg^{-1}, by using hydrogen and silver-silver chloride electrodes. From these measurements it is possible to determine the Pitzer mixing coefficients $^S\theta_{H,La}$ and $\psi_{H,La,Cl}$ as a function of temperature. They are well represented by linear equations yielding temperature-invariant estimates of $\partial^S\theta_{H,La}/\partial T$ and $\partial\psi_{H,La,Cl}/\partial T$. These estimates may be used to predict the relative apparent molar enthalpy for aqueous solutions containing H^+, La^{3+}, and Cl^- with reasonable confidence. (22 refs.)

103574 Thermodynamic and kinetic descriptions of equilibrium. P.L.Corio (Dept. of Chem., Univ. of Kentucky, Lexington, KY, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2416-19 (23 June 1983).
A method is given for determining a necessary and sufficient condition for consistency of the kinetic and thermodynamic descriptions of the equilibrium state. It is assumed that the kinetics satisfies J. Wei's axioms (1962), but no special assumptions are introduced regarding the form of the reaction rate near equilibrium. The computational procedure is illustrated in several examples. (13 refs.)

103575 Lattice model for nonrandom pairing and the determination of 'sociation' constants of organic complexes. D.E.Martire (Dept. of Chem., Georgetown Univ., Washington, DC, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2425-30 (23 June 1983).
A quasi-chemical calculation for a lattice of solute (a), inert-solvent (b), and additive-solvent (c) molecules of different size is used to obtain more general expressions for the infinite-dilution NMR chemical shift and GLC partition coefficient of the solute, as a function of mixed-solvent composition. The inert solvent is explicitly included in modeling the competitive equilibrium process. It is confirmed that the 'sociation' constant, which reflects the difference between the actual and random number of pair interactions involving potentially active segments on molecules a and c, is the experimentally determinable equilibrium constant of complex formation. The derived expressions, which provide a more complete description for weak complexes, are shown to reduce to familiar equations in the respective limits of random pairing and strong complexes. (33 refs.)

103576 Gas-liquid chromatographic and nuclear magnetic resonance study of haloform+di-*n*-alkyl ether+*n*-alkane mixtures at 30°C. T.J.Bruno, D.E.Martire, M.W.P.Harbison, A.Nikolic, C.F.Hammer (Dept. of Chem., Georgetown Univ., Washington, DC, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2430-6 (23 June 1983).
Gas-liquid chromatographic (GLC) relative partition coefficients and proton nuclear magnetic resonance (NMR) chemical shifts of haloform solutes ($CHCl_3$, $CHCl_2Br$, $CHBr_2Cl$, and $CHBr_3$) are measured as a function of di-*n*-alkyl ether+*n*-alkane mixed-solvent composition at 30°C. Equilibrium constants of 1:1 hydrogen-bond complex formation ($K_{ac}{}^c$) are extracted from these data using equations derived from a nonrandom pairing model. The average difference between the $K_{ac}{}^c$ values determined from the GLC and NMR measurements, respectively, is 0.008 L mol^{-1}. These values are not highly dependent on the nature of the haloform, or on the chain length of the ether and paraffin solvent molecules. The contribution to the GLC data from interactions involving the halogen end of the haloform molecule and solvent molecules, are analyzed and discussed. (33 refs.)

103577 Molecular structure of liquid alcohols. P.Huyskens (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium).
J. Mol. Struct. (Netherlands), vol.100, p.403-14 (July 1983).
A new thermodynamic treatment of continuous association is presented, where the various equilibria between *i*-mers are replaced by a single equilibrium between an O-H group in the bonded and the non-bonded states, linked in both cases to an indefinite ensemble of molecules. The treatment leads to an association constant K which differs from those considered in the theories of Kretschmer and Wiebe (1954) and of Wieh and Bagley (1967). For pure alcohols the association constant can be estimated from the vapor pressure of the alcohol and that of the homomorphous hydrocarbon. The fraction γ of free O-H groups determined in this way is markedly smaller than those calculated from the other theories. For the normal alcohols the product KV_A is approximately constant at a given temperature, V_A being the molar volume. This can be expected from the increasing of the standard entropy of the non-bonded molecules when the molecular volume increases. For secondary and tertiary alcohols the product KV_A is significantly lower due to steric hindrances. For all the alcohols considered the enthalpy of the hydrogen bond remains nearly constant $-\Delta H$ being equal to 24.8 ± 2 kJ mol^{-1}. (38 refs.)

103578 The standard enthalpy of formation of $LaNi_5$. The enthalpies of hydriding of $LaNi_{5-x}Al_x$. W.N.Hubbard, P.L.Rawlins, P.A.Connick, R.E.Stedwell,Jr., P.A.G.O'Hare (Chem. Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.785-98 (Aug. 1983).
The enthalpies of reaction in HCl(aq) of $LaNi_5$(cr), La(cr), and Ni(cr) were measured. From these measurements and appropriate auxiliary quantities, the standard enthalpy of formation, $\Delta_f H_m{}^\circ$, of $LaNi_5$(cr), was determined. The enthalpies of reaction between H_2 and $LaNi_5$, as well as $LaNi_{4.5}Al_{0.5}$, and $LaNi_4Al$, have been measured by hydrogen titration calorimetry. The enthalpy of solution of H_2 in the α-phase of $(LaNi_5+H_2)$ is -28 kJ.mol^{-1}, and in the two-phase plateau region the enthalpy of hydriding by H_2 is $-(31.6 \pm 0.2)$ kJ.mol^{-1}. In the two-phase plateau region of $(LaNi_{5-x}Al_x+H_2)$ the enthalpy of hydriding by H_2 is -38 kJ.mol^{-1} for $LaNi_{4.5}Al_{0.5}$ and -46 kJ.mol^{-1} for $LaNi_4Al$. The relation between the enthalpy of hydriding of the alloy by H_2 and its aluminum content was found to be $\Delta_{hyd}H_m{}^\circ$ ($LaNi_{5-x}Al_x$, cr, 298.15K)$=-(31.6+14.4x)$ kJ.mol^{-1}. The thermodynamic quantities at $T=298.15$K are reported $\Delta_f G_m{}^0$(kJ×mol^{-1}) $LaNi_5$ -159.1 ± 8.3 3.5 ± 0.8 -160 ± 8.3 $LaNi_5H_{6.2}$ -258 ± 8.3 -339.5 ± 0.9 -157.4 ± 8.3. (22 refs.)

103579 Hulett's enhanced solvent tension. An alternative to Lewis' diminished solvent activity. H.T.Hammel (Max-Planck-Inst. fur Physiologische und Klinische Forschung, Bad Nauheim, Germany).
Phys. & Chem. Liq. (GB), vol.13, no.1, p.25-36 (1983).
Hulett proposed in 1903 that solute enhances the tension in the cohesive forces between solvent molecules by an amount equal to the osmotic pressure of the solvent. He attributed all the colligative properties of the solution solvent to this enhanced solvent tension. In 1908 Lewis proposed that the altered state of the solvent in solution was due to a reduced activity caused by the solute. Hulett's proposal is based on physical principles and thermodynamic argument and is a valid alternative to Lewis' proposal. Under all circumstances, the solution solvent is altered by the solute precisely as if the average tension between the molecules of solvent was enhanced by the osmotic pressure of the solution solvent, Π_1, no matter how the solute does it, no matter what the compressibility of the solvent is at any T and p and no matter what the relationship is between Π_1 and x_1, the mole fraction of solvent in the solution. 82.65 SURFACE PROCESSES

103580 Statistical rates for reactions of heterogeneous surfaces: the influence of non-ideal collisions. S.D.Prasad, L.K.Doraiswamy (Nat. Chem. Lab., Poona, India).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.129-34 (29 July 1983).
Using the random patch model, kinetic expressions are derived for the pressure dependence of first- and second-order surface reactions. Collisions between gas-phase and adsorbed molecules which affect the desorption probability are taken into account. For first- and second-order reactions a representation for the rates is given in terms of incomplete gamma functions for three distributions. These collisional effects cause the surface rates to rise steeply in a narrow range of pressure, due to the exponential dependence of the local isotherm on pressure. (14 refs.)

103581 Resonance Raman spectra of benzene adsorbed on Cu^{2+}-montmorillonite. Formation of poly(*p*-phenylene) cations in the interlayer of the clay mineral. Y.Soma, M.Soma (Nat. Inst. of Environmental Studies, Ibaraki, Japan), I.Harada.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.153-6 (29 July 1983).
Resonance Raman spectra of benzene adsorbed on Cu^{2+}- and Ru^{3+}-montmorillonites have demonstrated the formation of poly(*p*-phenylene) cations in the interlayer of the clay mineral. The interlayer cation is reduced in a humid atmosphere to yield poly(*p*-phenylene). Biphenyl or *p*-terphenyl gives consistently the same product. (10 refs.)

103582 Diffusion controlled reactions of gases with surfaces and state dependent reactivity. II. Diffusion slip and Knudsen corrections. L.Monchick (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA), S.Hess.
J. Chem. Phys. (USA), vol.79, no.4, p.2098-9 (15 Aug. 1983).
For pt.I see ibid., vol.77, p.307 (1982). Recently, the authors considered the reaction rate of a surface with molecules diffusing up from an ambient solvent, and demonstrated measurable dependence on internal state of the solute molecules. The distribution and state of the reactant were described by a Bloch-Torrey equation and the reaction by an extension of the radiation boundary condition customarily used in diffusion controlled reaction theory. More refined considerations of simple reactions, based on kinetic theory, show that the reaction rate should be corrected for finite diffusive step length and for nonequilibrium perturbations of the velocity distribution function. An approximate correction for both effects is introduced into the state dependent diffusion mediated reaction rate theory. (13 refs.)

103583 Surface enhanced Raman spectra of benzotriazole adsorbed on a copper electrode. J.Rubim, I.G.R.Gutz, O.Sala, W.J.Orville-Thomas (Inst. de Quimica, Univ. de Sao Paulo, Sao Paulo, Brazil).
J. Mol. Struct. (Netherlands), vol.100, p.571-83 (July 1983).
The surface enhanced Raman spectrum of benzotriazole (BTAH) adsorbed on a copper electrode has been studied as a function of the potential applied to the electrode. The effect of pH and of the type of halide in the electrolyte solution has also been investigated. The presence of some complexes involving Cu(I), benzotriazole or benzotriazolate (BTA^-) and the halide has been characterized. The protective film formed on copper surface, in the presence of benzotriazole, has been identified as cuprous benzotriazolate [Cu(I)BTA]. (23 refs.)

103584 Isopiestic studies of aqueous solutions at elevated temperatures. VII. $MgSO_4$ and $NiSO_4$. H.F.Holmes, R.E.Mesmer (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.709-19 (Aug. 1983).
Isopiestic measurements have been made on $MgSO_4$(aq) and $NiSO_4$(aq) at 383.14K with NaCl(aq) serving at the reference electrolyte. Irreversible solubility effects prevented successful measurements at higher temperatures. Osmotic coefficients at 383.14K are smaller and less dependent on molality than at 298.15K. The ion interaction model, as modified for 2-2 electrolytes, was fitted to the osmotic coefficients. Only three of the four parameters of the model could be evaluated, thereby precluding the direct calculation of activity coefficients from the isopiestic results. Combination of the present

results with published freezing temperatures and enthalpies does permit the computation of activity coefficients in the case of $MgSO_4$(aq). At 383.15K the activity coefficient of $MgSO_4$(aq) becomes quite small (<0.05) at very moderate molalities (0.5 mol.kg^{-1}). Because of uncertainties in the calculations only general observations concerning trends in the activity coefficient at elevated temperatures and high molalities are warranted. (34 refs.)

103585 Surface ozonation and photooxidation of polyethylene film. J.Peeling (Dept. of Chem., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia), D.T.Clark.
J. Polym. Sci. Polym. Chem. Ed. (USA), vol.21, no.7, p.2047-55 (July 1983).
High-density polyethylene (HDPE) and low-density polyethylene (LDPE) films were oxidized by treatment with ozone and by photooxidation with a low-pressure mercury lamp. The changes that resulted in the surfaces of the films were followed by ESCA. On ozonation, the surface of LDPE initially is oxidized more rapidly than that of HDPE; however, extended ozonation produces a surface composition that corresponds to C_8O for HDPE and to $C_{18}O$ for LDPE. The surface oxidation products are mainly carboxyl groups, with lower levels of carbonyl and C-O groups. For both polymers photooxidation provides more extensively oxidized surfaces than ozonation, although the surface of HDPE oxidizes slightly faster than that of LDPE treated under identical conditions. In both cases the surface stoichiometry after extensive photooxidation is C_6O. The functional groups formed are mainly carboxyl and C-O. The effects of ozonation and photooxidation on the polyethylene surfaces are compared with those produced by several other means of surface oxidation. (46 refs.)

103586 Chemiluminescence in autocatalytic thermal oxidation of polymers. L.Zlatkevich (Allied Fibers & Plastics, Morristown, NJ, USA).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.7, p.571-4 (July 1983).
A distinguishing feature of the oxidation kinetics of many organic substances is the autocatalytic reaction that is accompanied by the accumulation of hydroperoxides. Hydroperoxides appear as one of the first products of the reaction. Subsequent oxidation of the parent substrate is autocatalyzed by the decomposition of hydroperoxides which produce free radical chain carriers for the chain reaction. Numerous techniques have been developed over the years to study the oxidative stability of polymers. Among various methods, chemiluminescence accompanying the thermal oxidation has been referred to by several authors. The intensity of emitted light could be a convenient criterion for the estimation of thermal oxidative stability of polymers. A typical light intensity-versus-time curve for the chemiluminescence produced by autoxidation of a polymer (normally made at constant sample temperature) consists of four regions. There is an induction period during which the light intensity is low and practically constant, oxidation is slight, and buildup of peroxides or hydroperoxides is slow. Following the induction period, there is an autocatalytic stage in which the peroxides catalyze further oxidation and the intensity of emitted light increases quite rapidly. The induction and acceleration periods are not separate phenomena, but parts of a typical autocatalytic reaction. The light intensity next reaches the highest level (peak peroxide concentration). Finally, there is a period of light decay (a deceleration of the rate of oxidation). (5 refs.)

103587 Ab initio study of the symmetric reaction path of H_2 with a surface *V* center in magnesium oxide. S.A.Pope (Chem. Dept., Univ. of Manchester, Manchester, England), M.F.Guest, I.H.Hillier, E.A.Colbourn, W.C.Mackrodt, J.Kendrick.
Phys. Rev. B (USA), vol.28, no.4, p.2191-8 (15 Aug. 1983).
An all-electron ab initio calculation, including correlation effects, of the symmetric reaction path of H_2 with a surface *V* center in magnesium oxide has been carried out. The importance of lattice relaxation effects has been demonstrated, and the position of the saddle point has been located. The calculated barrier to the reaction, 40 kcal mol^{-1}, is considerably greater than the value necessary for H_2-D_2 exchange at 78K, suggesting that the lowest-energy pathway involves the asymmetric interaction of H_2 with the surface *V* center. (46 refs.)

103588 The role of adsorbed sulfur in the H_2-D_2 equilibrium reaction on Pt single crystals. C.M.Pradier, Y.Berthier, J.Oudar (Lab. de Phys.-Chimie des Surfaces, Univ. Pierre et Marie Curie, Paris, France).
Surf. Sci. (Netherlands), vol.130, no.1, p.229-43 (July 1983).
The H_2-D_2 equilibrium on Pt single crystals was investigated under intermediate pressure (100-400 Torr) and temperature (50-250°C), as a function of sulfur coverage. On Pt(100) and Pt(111), adsorbed sulfur modifies the kinetic parameters, activation energy and pre-exponential factor, the latter depends on the temperature on Pt(110) only. The clean Pt(110) face was found to be 5 times more active than the clean Pt(111). On both faces, adsorption of sulfur induces electronic effects on the neighbouring reactional sites. The difference in the behaviour of the two faces and a clear influence of the arrangement of the adsorbed sulfur atoms, deduced from LEED diagrams, tend to prove the structure dependency of the H_2-D_2 reaction. A consistent reaction mechanism could be proposed, involving the dissociative adsorption and surface recombination of hydrogen and deuterium, and the reaction between adsorbed molecules for high sulfur coverages. The value of the sulfur coverage which makes the platinum inactive towards H_2-D_2 is lower for the (111) than for the (110) orientation; this is in correlation with the roughness of the surface; the denser at atomic scale a surface is, the further is the extent of the lateral interactions due to adsorbed sulfur. (14 refs.)

103589 Adsorption and oxidation of simple organic compounds on platinum electrodes. H.Lal (Chem. Faculty, Inst. of Technol., Bombay, India).
Sov. Electrochem. (USA), vol.18, no.10, p.1208-15 (Oct. 1982). Translation of: *Elektrokhimiya (USSR),* vol.18, no.10, p.1359-66 (Oct. 1982).
The author generalizes the experimental data on the influence of the degree of aging of Pt/Pt electrodes and the presence of tightly chemisorbed O-type particles on the surface on the adsorption and oxidation of simple organic substances. The promoting role of adsorbed atoms in processes of oxidation of organic substances is discussed. (37 refs.)

103590 The role of surface phenomena in the interactions of reactive metals with gases. G.Horz, E.Fromm (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).
Vacuum (GB), vol.33, no.5, p.265-70 (May 1983).
The reactions of metals with gases are often controlled by reaction steps on the surface and, thus, they can be strongly influenced by non-metallic species either adsorbed on the surface or forming compound-like surface layers. Considering in particular the effects of oxygen, first energetic conditions for the formation of compound-like sorption layers and for the surface segregation of nonmetals are briefly treated. Then experimental results are presented which refer to these surface phenomena and to their influence on metal-gas interactions. The discussion deals with (i) the formation of oxide-like sorption layers on transition metals (77-400K) and the influence of oxidic layers on the hydrogen absorption by tantalum (77-700K) and with (II) the surface segregation of oxygen on tantalum and α-hafnium (1400-2100K) and the influence of surface-segregated oxygen or nitrogen on the kinetics of the decomposition of hydrocarbons on tantalum and α-hafnium (1300-2300K). 82.70 DISPERSE SYSTEMS

(for flow behaviour, see 47.55K)

103591 Surface-enhanced Raman scattering of colloid-stabilizer systems. P.C.Lee, D.Meisel (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.262-5 (5 Aug. 1983).
Surface-enhanced Raman scattering (SERS) from silver and gold colloids stabilized by poly(vinyl alcohol) (PVA), poly(ethylene glycol), carbowax, and poly(vinyl pyridine) (PVP), has been observed. From the bands observed in the SERS of the PVA stabilized sols it is concluded that the PVA adsorbs on the metal through unhydrolyzed acetate groups. Carbowax adsorbs on the metal through the C-O-C groups. PVP adsorbs through the pyridine π system which leads to a flat lying ring conformation on the metal. (16 refs.)

103592 Motion of a cloud of particles under gravity and its sedimentation on a flat horizontal surface. G.M.Makhviladze, O.I.Melikov.
Fluid Dyn. (USA), vol.17, no.6, p.867-75 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza,* vol.17, no.6, p.64-73 (Nov.-Dec. 1982).
On the basis of the nonstationary two-dimensional equations of the mechanics of heterogeneous media a numerical investigation is made of the motion of a cloud of particles under the influence of gravity in an unbounded medium and the interaction of the descending cloud of particles with a flat horizontal surface. Depending on the degree of hydrodynamic interaction between the particles, there are different regimes of motion of the cloud during sedimentation; the change in its spatial configuration determined by the large-scale vortex motion of the carrier medium is determined. The concentration distributions of the carrier medium is determined. The concentration distributions of the particles on the sedimentation surface are obtained. A coefficient of dispersal is introduced for the cloud of particles on the flat horizontal surface, and its dependence on the concentration of the particles, their diameters, and other parameters is investigated. (17 refs.)

103593 Microemulsions and colloids. C.Taupin (Lab. de Phys. de la Matiere Condensee, Coll. de France, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.551-6 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Colloidal systems are presently the object of an intense scientific activity since they are unique systems for the study of interactions which are of the order of kT in the intermediate range of distances about several hundreds of Angstrom. Microemulsions have in common many macroscopic physical properties such as transparency, fluidity but, depending on the particular chemical composition, various structural facets appear. They go from true particulated colloids to systems in dynamical exchange and, for some cases, to critical mixtures which put them in continuity to true solutions. (10 refs.)

103594 A theory on the electroviscous effect: a method for the estimation of the viscosity of dispersions of charged spherical colloidal particles. J.A.Menjivar, C.Rha (Dept. of Nutrition & Food Sci., MIT, Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.79, no.2, p.953-6 (15 July 1983).
A method to estimate the effect of electrostatic interactions on the shear viscosity of concentrated dispersions of charged spherical particles is presented. The secondary electroviscous effect can be related to an effective maximum packing fraction (ϕ_M), defined as the particle concentration at which the charged particles attain complete long-range order. The maximum packing fraction (ϕ_M) can be determined either theoretically or experimentally. This excluded volume approach quantitatively describes the roles of surface potential (ψ_0), particle radius (a), suspending medium ionic strength (I), and particle concentration (ϕ) on the low-shear viscosity of colloidal

monodispersions of charged spherical particles. The validity of the proposed theory is suggested by an agreement with existent literature data. (25 refs.)

103595 The phase diagram of charged colloidal suspensions. D.Hone (Inst. for Solid State Phys., Tokyo Univ., Tokyo, Japan), S.Alexander, P.M.Chaikin, P.Pincus.
J. Chem. Phys. (USA), vol.79, no.3, p.1474-9 (1 Aug. 1983).
The thermodynamics of a system of identical electrically charged spheres in colloidal suspension in a polar fluid (typically, H_2O), are calculated within a model of point particles interacting via a screened Coulomb (Yukawa) potential of suitably renormalized strength. The particles are taken to be sufficiently massive that a classical theory is appropriate. The free energies of the crystalline phases are calculated within a mean field theory which is an extension of the self-consistent harmonic approximation. The melting curve is estimated from the semiempirical Lindemann rule, with mean squared displacements again calculated self-consistently. As functions of the relevant parameters: electrical charge of each sphere, density of spheres and added salt concentration, stable predicted phases include FCC and bcc crystals and a disordered fluid. Under suitable circumstances a reentrant BCC→FCC→BCC transition is predicted as salt is added, and BCC is predicted always likely to be the stable phase just below the melting transition. (9 refs.)

103596 Surface tensions and micellization of ω-cyclohexylalkanoic acids and their sodium salts. A.Skauge, J.J.Spitzer (Dept. of Chem., Univ. of Lethbridge, Lethbridge, Alberta, Canada).
J. Phys. Chem. (USA), vol.87, no.13, p.2398-401 (23 June 1983).
The surface properties of a homologous series of ω-cyclohexylalkanoic acids and their sodium salts of general formula $C_6H_{11}(CH_2)_nCOOH$ with $n=0$, 1, 2, 3 were determined at 25°C. For sodium carboxylates with $n=1$, 2, 3 the critical micelle concentrations were found to be 1.0, 0.53, and 0.26 M. Surface tension measurements on aqueous solutions of these compounds were used to calculate the saturation areas per molecule, the free energies of adsorption, and the efficiency and effectiveness of adsorption. The cyclohexyl ring in these compounds makes the saturation areas larger than those of the corresponding straight-chain acids and salts. This effect diminishes with the increasing number of CH_2 groups in the alkyl chain. A 'rule of two'; ($-RT$ ln 2) is found to be valid for the standard free energy of adsorption per CH_2 group to a charged air/solution interface as compared to the 'rule of three' ($-RT$ ln 3) that is typical of uncharged interfaces. (30 refs.)

103597 Temperature-induced phase transition and structural changes in micellar solutions of sodium oleate observed by Raman scattering. P.T.T.Wong, H.H.Mantsch (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).
J. Phys. Chem. (USA), vol.87, no.13, p.2436-43 (23 June 1983).
Raman spectra of aqueous sodium oleate in the coagel and micellar phases have been measured as a function of temperature over the temperature range from −40 to 40°C. The temperature-induced phase transition between the micellar and coagel phases on both heating and cooling has been characterized. The transition exhibits very high hysteresis, the critical micellization temperature of 0.42 M sodium oleate being observed at 27°C, while the critical coagelization temperature of this system was found at 11°C. Changes in the spectra, including the polarized Raman spectra of the micellar phase, has been used to discuss short-range structural changes of various functional groups in sodium oleate. (49 refs.)

103598 Critical behaviour of the elastic constant and the friction coefficient in the gel phase of gelatin. J.-C.Bacri, D.Gorse (Lab. d'Ultrasons, Univ. Pierre et Marie Curie, Paris, France).
J. Phys. (France), vol.44, no.8, p.985-91 (Aug. 1983).
The critical behaviour of the elastic constant and the friction coefficient have been measured in the gel phase of gelatin. The critical exponents, 1.8 for the elastic constant, and 1 for the friction coefficient are in good agreement with 3d-percolation theory. (15 refs.)

103599 Existence and properties of post-gel solutions for the kinetic equations of coagulation. F.Leyvraz (DPMC, Univ. de Geneve, Geneve, Switzerland).
J. Phys. A (GB), vol.16, no.12, p.2861-73 (21 Aug. 1983).
The kinetic equations of coagulation with kernels R_{ij} are studied for both factorisable ($R_{ij}=r_ir_j$) and diagonal ($R_{ij}=A_i\delta_{ij}$) kernels. It is rigorously shown that they allow solutions of the type $c_j(t)=a_j/t$ for suitably chosen a_j. These solutions are further shown to have finite mass if $R_{jj}\sim j^d$ for $d>1$. The asymptotic behaviour of the a_j is also studied and found to agree with numerous previous findings. (8 refs.)

103600 The primary electroviscous effect in a suspension of spheres with thin double layers. E.J.Hinch, J.D.Sherwood (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.132, p.337-47 (July 1983).
The authors study the primary electroviscous effect in a suspension of spheres when the double layer thickness κ^{-1} is small compared with the particle radius a. The case of a 1-1 symmetric electrolyte is examined using the methods of Dukhin and coworkers (1974), whilst the asymmetric electrolyte is studied along lines similar to those of O'Brien (1983). Sherwood's (1980) asymptotic results for high surface potentials and high Hartmann numbers are extended and complemented. (8 refs.)

103601 Coagulation equations with gelation. E.M.Hendriks, M.H.Ernst, R.M.Ziff (Inst. voor Theoretische Fysica, Rijksuniv. Utrecht, Utrecht, Netherlands).
J. Stat. Phys. (USA), vol.31, no.3, p.519-63 (June 1983).
Smoluchowski's equation for rapid coagulation is used to describe the kinetics of gelation, in which the coagulation kernel K_{ij} models the bonding mechanism. For different classes of kernels the authors derive criteria for the occurrence of gelation, and obtain critical exponents in the pre- and postgelation stage in terms of the model parameters; they calculate bounds on the time of gelation t_c, and give an exact postgelation solution for the model $K_{ij}=(ij)^\omega$ ($\omega>1/2$) and $K_{ij}=a^{i+j}$ ($a>1$). For the model $K_{ij}=i^\omega+j^\omega$ ($\omega<1$, without gelation) initial solutions are given. It is argued that the kernel $K_{ij}\sim(ij)^\omega$ with $\omega\simeq1-1/d$ (d is dimensionality) effectively models the sol-gel transformation in polymerizing systems and approximately accounts for the effects of cross-linking and steric hindrance neglected in the classical theory of Flory (1953) and Stockmayer (1943) ($\omega=1$). For all ω the exponents, $\tau=\omega+3/2$ and $\sigma=\omega-1/2$, $\gamma=(3/2-\omega)/(\omega-1/2)$ and $\beta=1$, characterize the size distribution, at and slightly below the gel point, under the assumption that scaling is valid. (36 refs.)

103602 Particle size from optical anisotropy effects in scattered light. J.C.Ravey, P.Mazeron (Lab. de Biophys. Moleculaire, Univ. de Nancy I, Vandoeuvre les Nancy, France).
Polymer (GB), vol.24, no.8, p.991-4 (Aug. 1983).
An original light-scattering method often suitable for the case of anisotropic particles is explained. Two particular values of the scattering angle θ are needed: θ_m, the angular position of the minimum of the H_h component, and θ_0, the angular value for which $H_h=V_v$. This method has been successfully applied to the case of copolymer single crystals. (10 refs.)

103603 Light-scattering studies of hydroxyethylcellulose in water/nonionic surfactant binary mixtures. Evidence for preferential solvation of polymer chains by surfactant micelles. Y.Boscher, F.Lafuma, C.Ouivoron (Lab. de Phys.-Chimi. Macromoleculaire, ESPCI, Paris, France).
Polym. Bull. (Germany), vol.9, no.10-11, p.533-6 (April 1983).
The authors report the occurrence of interactions innonionic polymer (hydroxyethylcellulose:HEC)/nonionic surfactant (polyethylene oxide nonly phenyl ether) systems through light-scattering studies, in a given composition range of the binary mixture H_2O/surfactant, preferential solvation by surfactant micelles is observed. The variation of the preferential adsorption coefficient with surfactant concentration is governed by the size of the micelles. (9 refs.)

103604 Adsorption of polysaccharides on a calcite using spin labelled polymers. M.Rinaudo, C.Noik (Centre de Recherches sur les Macromolecules Vegetales, Univ. Sci. et Medicale de Grenoble, Grenoble, France).
Polym. Bull. (Germany), vol.9, no.10-11, p.543-7 (April 1983).
The experimental results given concern the preparation of spin labelled amylose and amylopectins. These polymers are then used to investigate the adsorption on a calcite dispersed in water. From analysis of the electron spin resonance spectrum, the fractions of monomers involved in trains (p) are deduced; the dependence of p on the molecular weight of the amylopectins and the molecular structure of the polymers are discussed. (7 refs.)

103605 An observation on the Han-Villamizer critical pressure concept in thermoplastic foams. J.L.Throne (Amoco Chemicals Corp., Naperville, IL, USA).
Polym. Eng. & Sci. (USA), vol.23, no.6, p.354-5 (April 1983).
Draws together the Han-Villamizar (1978) experimental observations in the critical pressure at which gas bubbles became visible in flowing thermoplastic melts and a simple method of predicting the equilibrium pressure based on gas solubility. It is shown that the observed pressure is 40 to 75 per cent of the calculated pressure. (7 refs.)

103606 Influence of the nature of the supporting electrolyte on the adsorption of substances forming two-dimensional condensed layers at the mercury/electrolyte interface. E.V.Stenina, N.P.Kolobaeva, B.B.Damaskin, N.V.Fedorovich (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1155-60 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1299-304 (Oct. 1982).
The influence of the nature and concentration of the supporting electrolyte on the adsorption of substances which form two-dimensional condensed layers has been investigated by recording C-E and C-t curves. The choice of spatial isomers of adamantanol and borneol as objects of investigation makes it possible to attribute all the differences in the kinetics of the formation of the condensed layers of these isomers to the different conditions for the occurrence of the respective adsorption steps. The specifically adsorbed background ions and the concentration of the supporting electrolyte have a strong influence on the range of potentials for the adsorption of the surfactants and the kinetics of the filling of the surface. (8 refs.)

103607 Determination of adsorption parameters of two-dimensional condensed layers of organic compounds from experimental C vs. E curves. E.V.Stenina (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1199-203 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1349-52 (Oct. 1982).
For cases where the attraction constnant (α) and the capacity at limiting coverage (C') are linear functions of potential, a method of calculating the adsorption parameters of organic compounds is suggested which is based on an analysis of desorption potential as a function of concentration of the organic material. The accuracy is estimated with which adsorption parameters can be calculated by this method, both in the above situation and in the similar case where α and C' do not change with potential. This estimate is obtained with the aid of simulated $j\phi_d$ vs. ln c curves. (3 refs.)

82.80 CHEMICAL ANALYSIS AND RELATED PHYSICAL METHODS OF ANALYSIS

103608 Photodiode array detectors for LC. S.A.Borman.
Anal. Chem. (USA), vol.55, no.8, p.836a-42a (July 1983).
The growing importance and advantages of photodiode array detectors for liquid chromatography are discussed. (5 refs.)

103609 Structure determination of carbonates and diglycol carbonates by gas chromatography-mass spectrometry. S.P.Griff (Dart & Kraft Inc., Paramus, NJ, USA).
Appl. Spectrosc. (USA), vol.37, no.4, p.354-7 (July-Aug. 1983).
The use of spectroscopy and chromatography permitted the elucidation of the structures of various carbonates and diglycol carbonates as well as the prediction of fragmentation pathways for these classes of compounds. (1 ref.)

103610 Geothermal analysis at the wellhead. C.Lawrence.
EPRI J. (USA), vol.8, no.6, p.28-32 (July-Aug. 1983).
EPRI's mobile laboratory allows precise on-site chemical analyses of geothermal fluids to mitigate problems of corrosion and scale. The development and facilities offered by this mobile laboratory are briefly described. (no refs.)

103611 Robust estimation in pulse fluorometry. A study of the method of moments and least squares. I.Isenberg (Dept. of Biochem. & Biophys., Oregon State Univ., Corvallis, OR, USA).
Biophys. J. (USA), vol.43, no.2, p.141-8 (Aug. 1983).
Most laboratories use least-squares iterative reconvolution (LSIR) as a routine method for estimating decay parameters in pulse fluorometric data. It is shown here, however, that LSIR is very sensitive to small amounts of error in the data whenever two decays become too close to one another, or whenever analyses of three decays are attempted. In such cases, inferior methods of estimating integrals, small zero point shifts, or small errors in the measured exciting light will result in failures of least squares, where the method of moments, with moment index displacement and λ invariance testing, will succeed. The method of moments is therefore robust with respect to such errors while least squares is not. (27 refs.)

103612 The combined use of chromatography and the mass spectrometer in industrial application. M.O.Mizier.
Regul. & Mando Autom. (Spain), vol.17, no.129, p.87-92 (June 1983). In Spanish.
The article describes the combined use of chromatography (in the gas and liquid phases) and the mass spectrograph as a powerful means of identifying and quantifying the composition of mixtures which occur in toxicology, pharmacology, and in the oil, perfumery and food industries. The process consists in using chromatography to separate the constituents of the mixture and the mass spectrometer to identify them. It discusses gas- and liquid-phase chromatography, the mass spectrometer, and the two resulting interfaces, with examples of the available apparatus and a description of various methods of ionisation in mass spectrography. (no refs.) *C.J.O.G.*

103613 Absolute α-induced thick-target gamma-ray yields for the elemental analysis of light elements. R.Lappalainen, A.Anttila, J.Raisanen (Dept. of Phys., Univ. of Helsinki, Helsinki, Finland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.441-4 (1 July 1983).
A systematic study of the absolute thick-target yields of prompt γ-rays following $^4He^+$ bombardment has been carried out at $E_\alpha=2.4$ MeV for the elements $Z=3$-9, 11-14. The spectra of interest are depicted and a table of the most suitable γ-rays for elemental analysis is given. The detection limits are given under practical measuring arrangements. The advantage of the method is its good sensitivity for the detection of Li, Be, B and F on the ppm level even in samples containing high concentrations of other light elements such as Na, Mg and Al. (10 refs.)

103614 Application of coincidence techniques to X-ray fluorescence analysis. P.Puumalainen, P.Sikanen (Dept. of Phys., Univ. of Kuopio, Kuopio, Finland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.463-7 (1 July 1983).
Two methods are presented for the reduction of background in X-ray fluorescent spectra. This is achieved by requiring coincidence between either the photoelectron and the characteristic X-ray or the K- and L-characteristic X-rays of the element of interest. This results in about one order of magnitude loss in the count rate of characteristic X-rays, which can be compensated for by increasing the intensity of the X-ray source. An advantage of the method is that there are virtually no background counts in the spectra. (9 refs.)

103615 Polarisation properties of bremsstrahlung produced by electron opaque targets of low-Z elements with application to X-ray fluorescence analysis. P.Sikanen, P.Puumalainen (Dept. of Medical Phys., Univ. of Kuopio, Kuopio, Finland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.469-73 (1 July 1983).
An X-ray tube with changeable transmission-type anode was constructed for the production of linearly polarised bremsstrahlung. For anode materials two low-Z elements, Al ($Z=13$) and Cu ($Z=29$), were chosen. Polarisation of X-rays emitted at an angle of 55° with respect to the direction of electrons was measured as a function of electron and photon energy. The X-ray source was also used in X-ray fluorescence analysis to directly excite fluorescence in the sample. A background reduction by a factor of 3.3 with respect to unpolarised excitation was observed. (12 refs.)

103616 Improved flow-through GC/IR lightpipe. S.E.Garlock (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.12, p.6709-10 (May 1983).
The effluent from gas chromatograph column is passed into a hollow lightpipe and to such additional detectors or waste, as desired, and drawn by Bernoulli effect. (no refs.)

103617 In situ investigations of the metal-compound semiconductor interaction by mass spectrometry and electrical resistance measurements. D.Szigethy, I.Mojzes, T.Sebestyen (Res. Inst. for Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.117-29 (1 Aug. 1983).
The authors describe the experimental technique of an in situ mass spectrometric method proved to be suitable for studying the processes taking place during heat treatments of contacts between metals and compound semiconductors. This method was combined with an in situ electrical measurement of the voltage drop across the sample during the heat treatment. In the case of gallium arsenide, the contacts were exposed to an arsenic molecular beam for replacing the arsenic evaporated out of the contact system due to high-temperature annealing. (30 refs.)

103618 Mass spectrometric studies of impurities in silane and their effects on the electronic properties of hydrogenated amorphous silicon. R.R.Corderman, P.E.Vanier (Div. of Metall. & Materials Sci., Brookhaven Nat. Lab., Upton, NY, USA).
J. Appl. Phys. (USA), vol.54, no.7, p.2987-92 (July 1983).
The concentration of volatile impurities in silane (SiH_4) and disilane (Si_2H_6) used to prepare hydrogenated amorphous silicon (a-Si:H) thin films by glow-discharge deposition has been measured by modulated molecular beam mass spectrometry with a sensitivity of 1 ppm. From dark conductivity measurements on these films the location of the Fermi energy E_F was determined. The Fermi levels of a-Si:H films were progressively lower with increasing concentrations of chlorine-containing molecules (mostly HCl and SiH_3Cl) in the silane, indicating that these species can act as weak p-type dopants in a-Si:H. Oxygen-containing species (mostly SiH_3OSiH_3) were also detected in silane. It is clear from these results that large variations in electronic properties of glow discharge a-Si:H can be attributed to differences in purity of silane used in the deposition. (35 refs.)

103619 Radiation damage to lyophilized mineral solutions during electron probe analysis: quantitative study of chlorine loss as a function of beam current-density and sample mass-thickness. A.F.Le Roy (Biomedical Engng. & Instrumentation Branch, Nat. Inst. of Health, Bethesda, MD, USA), N.Roinel.
J. Microsc. (GB), vol.131, pt.1, p.97-106 (July 1983).
Results are reported for chlorine loss from lyophilized deposits with mass-thickness varying between 5 and 50 mg mm^{-2} for NaCl salts and 5 and 80 mg mm^{-2} for KCl salts. Electron accelerating voltage was kept constant at 15 kV. The range of beam current-density (I/S, current/sample surface area) was from 0.1 to 1.5 A mm^{-2}. Samples were irradiated for 1200 s. The results show that under some conditions there is a period of stable chlorine signal before chlorine loss occurs. This is observed between 0.1 and 1 A mm^{-2}, for a period which can last several hundred seconds depending on beam current-density and sample mass-thickness. For each value of I/S, however, no stable chlorine signal can be observed for samples whose mass-thickness exceeds a value negatively correlated with I/S. The curves of decrease of characteristic chlorine X-ray signal (expressed as per cent of count rate in the initial counting interval) versus irradiation time can be fitted by the sum of two exponentials with half lives T_1 and T_2. In NaCl, T_1 and T_2 values are highly correlated with I/S but not with mass-thickness. In KCl, T_1 is correlated only with mass-thickness and T_2 only with I/S. Mixing plasma with mineral solutions prevents chlorine loss. (29 refs.)

103620 A statistical method for the analysis of quantitative thin-film X-ray microanalytical data. D.F.Blake (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA), A.M.Isaacs, R.H.Kushler.
J. Microsc. (GB), vol.131, pt.2, p.249-55 (Aug. 1983).
A series of equations is presented through which thin-film X-ray microanalytical data may be characterized statistically. Test statistics based on the Gaussian distribution are then presented, together with examples of the use and evaluation of an empirically derived Mg/Ca working curve. (8 refs.)

103621 High-performance ion-exchange chromatography of alkali metals with conductivity detection. M.Ahmad, Attiq ur Rehman Khan (Pakistan Inst. of Nuclear Sci. & Technol., Nilore, Pakistan).
Nucleus (Pakistan), vol.18, no.4, p.29-35 (Oct.-Dec. 1981).
High-performance ion-exchange chromatography of alkali metal and ammonium ions was studied using a conductivity meter as detector. Dilution with 0.003 N nitric acid gave excellent resolution. Sensitivity levels, for a 200 μl injection, vary from 5 ppm for potassium to 0.1 ppm for lithium. A method to decrease retention times by reducing the exchange capacity of the cation exchange column used, by loading it with calcium ions, without affecting the resolution, has been described. Application of the method to water, soil and uranium dioxide samples has been demonstrated. (8 refs.)

103622 Transient decay following pulse excitation of diffuse scattering samples. R.W.Kessler, G.Krabichler, S.Uhl, D.Oelkrug (Inst. fur Phys. und Theoretische Chem., Univ. Tubingen, Tubingen, Germany), W.P.Hagan, J.Hyslop, F.Wilkinson.
Opt. Acta (GB), vol.30, no.8, p.1099-1100 (Aug. 1983).
Analytical solutions are examined in order to predict how the measured decrease in diffuse reflectance observed in the flash photolysis of powdered samples is related to the concentration of a transient absorbing species. It is shown on the basis of these calculations that when the transient reflectance changes by less than 10 per cent, the change in reflectance is a linear function of transient concentration. Experimental evidence supporting this conclusion is presented from studies of the triplet state of coronene chemisorbed on γ alumina where the concentration of the excited state can also be monitored by measuring luminescence intensity, which is shown to have a virtually identical dependence on the excited state concentration as the transient change in reflectance due to triplet-triplet absorption. Since the luminescence intensity is a linear function of the transient concentration, it follows that this is also true for the transient reduction in diffuse reflectance. Non-exponential decay of the transient reflectance of electronically excited molecules as a function of time may be observed because of heterogeneous adsorption. (9 refs.)

103623 Measurement of metastable atom microconcentrations in a molecular beam by resonant laser fluorescence. V.E.Dobryshin, V.I.Rakhovskii, V.M.Shustyakov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.37-40 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.68-72 (Jan. 1983).
A method is described for making absolute measurements of metastable atom microconcentrations in a molecular beam using the resonant fluorescence excited by a single-frequency dye laser. Absolute measurements of the concentrations of calcium atoms in metastable states $4^3P_{0,1,2}$ are presented. The relative error of these absolute measurements does not exceed 21% at a concentration of the order of 10^4 cm^{-3}. (7 refs.)

103624 End group determination in hydroxyl-telechelic polyisobutylenes by infrared spectroscopy. V.S.C.Chang, J.P.Kennedy (Inst. of Polymer Sci., Univ. of Akron, Akron, OH, USA).
Polym. Bull. (Germany), vol.9, no.10-11, p.518-24 (April 1983).
A convenient method for the quantitative determination of terminal hydroxy functionality of linear α,ω-di (hydroxy)-polyisobutylene and tri-arm star α,ω,δ-tri(hydroxy)polyisobutylene has been developed and evaluated. The method involves infrared quantitation of the free OH absorption at 3640 cm^{-1} by the use of long path liquid cells in very dilute CCl_4 solution (i.e. in a range where H bridges are absent) in conjunction with M_n determination (vapor phase osmometry or gel permeation chromatography). The results obtained by this method confirm earlier end-group analysis data obtained by more cumbersome methods and indicate that the number of OH end-groups in α,ω-di(hydroxy)polyisobutylene and α,ω,δ-tri(hydroxy)polyisobutylene produced by the infrared technique is 2.0 ± 0.1 and 3.0 ± 0.15, respectively. (31 refs.)

103625 A quantitative atom-probe field-ion microscope study of the compositions of dilute Co(Nb) and Co(Fe) alloys. R.Herschitz, D.N.Seidman (Dept. of Materials Sci., Cornell Univ., Ithaca, NY, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.63-88 (July 1983).
The compositions of Co-1.0 at.%Nb and Co-1.0 at.%Fe alloys have been measured using the atom-probe field-ion microscope. The main purpose of this experimental work was to find a set of optimum conditions which gives the correct solute concentrations in these alloys. This information was necessary for measuring the absolute compositions, in extensive investigations of solute atom segregation effects to individual stacking faults in these alloys. The dependence of each alloy's composition on the following parameters was inves-

tigated: (1) the specimen temperature; (2) the pulse fraction; (3) the field-evaporation rate; (4) the crystallographic plane; (5) the effect of the presence of hydrogen in the atom-probe on the measured Nb composition in a Co-1.0 at.%.Nb alloy. It is shown that the composition determined by the atom-probe FIM is very sensitive to some of the parameters listed above. The effects of these experimental parameters on the measured Nb and Fe concentrations are discussed in terms of possible field-evaporation models. Under certain experimental conditions drastically different behavior has been observed in these alloys; preferential field-evaporation of solute atoms in a Co-1.0 at.%Fe alloy and preferential retention of solute atoms in a Co-1.0 at.%Nb alloy was observed. Correct solute concentrations were obtained by using the following experimental parameters: (1) a specimen temperature of less than or equal to 60K; (2) a pulse fraction of greater than or equal to 0.10. (50 refs.)

103626 Surface analysis by XPS, AES and SIMS method in the Leybold Heraeus LHS 10 system. R.Wechsung (Leybold Heraeus GmbH, Cologne, Germany).
Vide les Couches Minces (France), vol.38, no.217, p.309-31 (May-July 1983). In French.
Attempts to introduce the principles of the various surface analysing methods. Typical examples are given which demonstrate the wide range of applications of these methods. In spite of the rapid development of surface analysing techniques within the last few years, their adoption in industry is just beginning. It is hoped that in the near future the analysing apparatus will be used not only for solving basic problems but also for routine analysis and process control. (10 refs.)

103627 The surface geometrical structure effect in X-ray fluorescence analysis of metallic samples. W.Stankiewicz, A.Fudal, M.Wojtowicz (Inst. of Non-Ferrous Metals, Gliwice, Poland).
X-ray Spectrom. (GB), vol.12, no.3, p.92-6 (July 1983).
The results of investigation into the effect of geometrical surface structure in X-ray fluorescence analysis of Cu-Ni alloy are presented. The experimental materials were samples of spectrometric standard quality, in which surfaces were especially prepared by grinding and polishing. The surface state was estimated qualitatively, using a scanning electron microscope, and quantitatively, using a profilograph, by the determination of the roughness parameters R_a and R_z. The relationships between the roughness parameters and Cu, Ni and Si fluorescent radiation intensities, as well as the scattered radiation from the X-ray tube anode element were established. The optimum range of the surface state for a given alloy has been defined. (6 refs.)

Greater Los Angeles Area Energy Symposium ....See Entry 98649

86.10 ENERGY RESOURCES AND THEIR UTILISATION

(inc. economic aspects; for nuclear engineering and nuclear power studies, see 28.00)

103628 Economic aspects of the utilization of regenerative sources of energy. H.-J.Ziesing (Deutsches Inst. fur Wirtschaftsforschung, Berlin, Germany).
Energiewirtsch. Tagesfragen (Germany), vol.33, no.7, p.435-42 (July 1983). In German.
Discusses legal, financial and industrial aspects of utilization of sources of energy in West Germany, with statistics. Nearly 5% of the GNP is spent on importing energy carriers. (29 refs.) *J.S.*

103629 The investment demand in energy and its dependence upon a consistent energy policy. R.von Bennigsen-Foerder.
Elektrotech. Z. ETZ (Germany), vol.104, no.13, p.641-3 (July 1983). In German.
The author states that with the end of the usual expansion in energy demand, competition between energy sources increases the importance of an economic energy policy including a revision of the attitude to coal as a favoured fuel. The falsehood of relating an increase in GNP to an equivalent increase in energy consumption is exposed. The author lays great emphasis upon the need for research in energy techniques without indicating which direction this should take. It is stressed however that the guidelines 'security of supply' and 'favourable price'—relative to today's energy situation—should not influence the path taken by research. (no refs.) *H.G.*

103630 The mathematical analysis on an efficient use of energy. H.Ohkubo, A.Suzuki, R.Kiyose (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan).
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.787-826 (Sept. 1982).
A basic question addressed here is how efficiently are limited energy resources such as oil consumed and can advanced energy such as nuclear be introduced. The definition of efficiency, therefore, is not in terms of thermodynamics but the most economical long-term allocation of energy. A number of investigators have applied the theory of dynamic linear programming for this question. Here, major attention is paid to a theoretical analysis on the shadow price of each constraint, which is a principal indicator of the efficiency, and to make a mathematical formulation on the technological progress factor, which is more or less inherent for advanced energy. For example, the types of constraints is classified mathematically and the general formula is derived to show the relation between shadow price for each constraint and marginal production cost of energy. The efficiency of a long-term nuclear fuel cycle system is examined as a representative to conclude that the marginal production cost of plutonium is quite sensitive to the assumption of the technological progress factor. (21 refs.)

103631 Australian energy supply/demand pattern changes since 1977. E.D.J.Stewart, B.B.Bennett, G.M.Folie, N.A.Galwey, J.C.Miller, J.L.Symonds, J.Tysoe.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.18-43
The paper reviews the changes in the Australian energy supply/demand patterns since the time of the Energy 1977 Conference organised by The Institution of Engineers, Australia. The paper consists of a section presenting an overview of the total Australian energy scene with special attention to the policies and actions of Government and their impacts plus a second section consisting of individual reviews of specific primary energy sources—black coal, brown coal, petroleum, minor energy sources, natural gas, uranium and electricity. (no refs.)

103632 Economic aspects of energy policy. G.W.Edwards.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.44-52
Economic studies of energy resources can be divided into two broad categories. One category can be termed 'macroeconomic'. Examples of such studies are provided by Vincent, Dixon, Parmenter and Sams (1979, 1980). The first of these studies was concerned with the effects of an Australian policy change (the adoption of import parity pricing for Australian crude oil in 1978) on such variables as employment, GDP and rural incomes. In the second study the effects of increases in world energy prices on variables of interest were examined. The second category of studies can be labelled 'resource allocation'. The emphasis in these is on the effects of various arrangements in the energy economy, and elsewhere in the economy, on the economic efficiency of energy production, consumption and trade. The orientation of the paper places it in the second category. (28 refs.)

Energy 83. Towards an Energy Policy for Australia ....See Entry 98613

86.10B Fossil and other fuels

103633 The contribution of coal for future energy requirements. D.S.Smith.
Electr. Energ.-Electron. (Portugal), no.188, p.261-7 (June 1983). In Portuguese.
The opening section gives a brief history, from about 1950, of the energy market. The increases in oil prices from 1973 are emphasised, as are some important political factors. A table gives the world energy balances for 1950, 1960, 1970 and 1973, split into coal, oil, gas and other forms. The case for coal is then presented as a secure and competitive commodity, fairly well distributed. A table shows the estimated recoverable quantities of oil, gas and coal over the Communist and non-Communist blocs. Further tables give energy reserves and consumption for these blocs in 1981, inter-regional coal commercial activities and world annual coal consumption in 1980. Details are given of coal utilisation in the electricity, cement and general industries. Some views of the European market are given. (no refs.) *G.V.D.*

103634 Coal classically. Comparison and evaluation of selected possibilities of coal utilisation. H.Klaiss, H.Steeb.
Energie (Germany), vol.35, no.6, p.152-8 (June 1983). In German.
Gives statistical data on world energy resources, coal resources in various countries and primary energy consumption in West Germany by sectors. Some techniques of coal utilisation are compared and their relative methods

assessed from energy, pollution and economic considerations. It is concluded that whatever, constraints might apply to future energy supplies, coal will play a dominant role, that, at present, classical methods of coal utilisation such as direct combustion and heat/power generation with their good efficiency and low pollution appear best from resource conservation aspects and that coal enrichment does not offer advantages over conventional combustion techniques. (22 refs.) *P.G.R.*

103635 The future role of oil and natural gas in the Soviet Union. A.F.G.Scanlan (BP, London, England).
Energiewirtsch. Tagesfragen (Germany), vol.33, no.7, p.465-9 (July 1983). In German.
Discusses the internal and international consequences of the stagnation of oil production in and export of natural gas from the Soviet Union, with statistics. (no refs.) *J.S.*

103636 Prospects for coal: technical developments. W.G.Kaye (National Coal Board, Cheltenham, England), T.J.Peirce.
Phys. Technol. (GB), vol.14, no.4, p.183-9 (July 1983).
The price advantage of UK coal over oil and gas suggests that it will regain a major share of the industrial energy market as the economy recovers. The development of efficient and reliable methods of coal burning is discussed. (4 refs.)

103637 Coal. T.G.Callcott, H.R.Goode, N.A.Brown, J.Cramsie, R.G.Davies, M.A.Johnson, G.R.Rigby, F.F.Roxborough, I.McC. Stewart, K.Sullivan.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.141-66
This paper sets out information, from the Australian perspective, under the following main headings; resources, production, transport and handling, demand and technology. (8 refs.)

103638 Synthetic liquid fuels in Australia. R.A.Durie, G.R.Drewe, P.Huggins, I.McC. Stewart.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.167-98
The paper briefly examines the future needs for synthetic liquid fuels in Australia and the potentials offered by coal, oil shale and natural gas as feedstocks. The current status of the technologies, under development, for producing liquid fuels from these nonrenewable fossil feedstocks, are reviewed, and problems/challenges to be faced in establishing a synthetic fuels industry in Australia, are identified and discussed. (18 refs.)

103639 Liquid fuels-petroleum. A.L.Salusinszky, H.W.Baddams, J.Harry, D.Nicklin, T.Ramsey, I.Shedden, G.Shiels.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.197-205
In the past five years Australia's transport fuel outlook has changed substantially. On the supply side of the balance the assessment of the known indigenous crude oil fields has improved to such an extent that peak production instead of declining from 1980, as was expected, can now be maintained at least to the middle of this decade. Furthermore, with the intensified exploration activity, which doubled in the last five years, there is at least a fifty percent chance that further discoveries will permit to maintain present production level until about 1990. In spite of the more optimistic outlook with respect to petroleum product supply in the 80s, Australia may be hit by emergency-caused interruptions in crude oil imports. Probably such interruptions will be short lived but a policy for increased storage of critical products could do much to blunt the impact of such occurrences. The situation of the 90s is difficult to predict but most probably indigenous crude oil supply in relation to liquid fuel demand will decrease. As a result beside imported crude oils liquid fuels derived from other sources, such as shale, tar, coal and natural gas may be required to supplement production. The burden of the high cost of the new fuels could be distributed more evenly by controlling the level of indigenous crude oil production in the 80s: an almost impossible political task. (4 refs.)

103640 Gas supply until 2000: some policy options. R.D.Palmer, D.Boddam-Whetham, J.Burnside, P.R.Eiszel, J.E.Hayes, R.Hutchinson, D.Polglaze.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.206-35
Australia has large gas reserves, but the location of the majority of these reserves is a long way from the main centres of demand. When the forecast demand for gas is matched against the existing supplies, it is apparent that the supply/demand matching problem is very different for the various gas companies. This paper looks at reserves and demand State by State. It then looks at the various ways the gas supply can be supplemented when the existing contracts expire or the presently declared reserves are finally depleted. The various options looked at include pipelining gas from other reserves, the use of liquified natural gas from Australian resources, and the manufacture of substitute natural gas. Some cost estimates are given for these. Most of the demand for gas is for heating purposes. However, gas is a valuable chemical feedstock, and some of these uses are discussed, and their potential demand for gas compared with the gas reserves. The use of gas as a transport fuel is also discussed. It can be concluded that Australia's known gas reserves are sufficient to last well into the next century if agreement can be made about how these reserves should be shared. The uncertainty about the level of future gas prices and the size of gas reserves can only extend the currently estimated life of the reserves. The technology to manufacture gas from a wide range of coals and oils is available elsewhere in the world, and little development will be required to adapt it to Australian feedstocks. The price of the gas so produced will be competitive with oil and should ensure a market for gas into the foreseeable future. (56 refs.)

103641 Energy from biomass. R.G.H.Prince, J.P.Barford, D.Barrett, R.B.Brooks, I.Gorrie, P.F.Greenfield, J.S.Keniry, K.D.Kirby, A.G.Lane, I.G.Prince, B.J.Ralph, P.A.D.Rickard, G.A.Stewart, B.Wonder.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.254-64
Biomass is a convenient term to broadly describe a wide range of materials of biological origin. By far the greatest quantity of biomass is in the form of plant cellular material, derived via the process of photosynthesis from incident solar radiation. Biomass has long been used as food, fibre, fuel and chemicals. As an energy resource it may be used in a multiplicity of ways. Unlike conventional fossil fuels, carefully managed biomass can be considered a renewable energy resource. (15 refs.)

103642 Energy use—transport. N.F.Gentle.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.298-315
The 1977 Task Force made ten recommendations with respect to transport. These recommendations were: 1. Fuel economy goals for motor vehicles to be prescribed. 2. Review of motor vehicle emission standards. 3. Emphasis should be placed on energy conservation in traffic management. 4. Emphasis should be placed on energy conservation in transport planning. 5. More effective use of motor cars should be emphasised. 6. Emphasis should be placed on energy efficient transport. 7. The use of LPG for certain vehicle fleets should be encouraged and implemented as a matter of urgency. 8. The feasibility of introducing synthetic liquid fuels compatible with motor gasoline should be investigated. 9. Electric powered transport should be encouraged. 10. The long term development of energy efficient land uses should be investigated. The main emphasis of this paper relates to Recommendation 5 (more effective use of motor cars) and Recommendation 6 (energy efficient transport). The paper also includes a discussion on Recommendation 9 (electric powered transport). (36 refs.)

103643 Energy use and conservation in buildings. R.J.Roennfeldt, E.R.Ballantyne, A.M.Brown, A.J.Cummine, A.van Ocken.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.316-29
This report identifies changes in energy use in Australian residential, commercial, institutional and industrial buildings for the period 1977 to 1982 and discusses the actions and initiatives which were significant determinants of these changes. It assesses the potential for future reductions in energy use in buildings and proposes strategies to assist this process. (15 refs.)

86.10D Wind energy

103644 Wind energy—a utility perspective. K.T.Fung, R.L.Scheffler, J.Stolpe (Southern California Edison Co., Rosemead, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.210
Of all the renewable energy systems, wind turbine generators are likely to make the earliest significant cost-effective contribution to the utility grid. This paper presents issues facing the utility industry relating to implementation of and effective wind energy program. The Company's wind energy program is presented, which is designed to provide pertinent answers to the technical, economic and environmental issues concerning WTG installations and their commercial visibility. (no refs.)

86.10H Geothermal energy

103645 Geothermal power generation—an aggressive utility program. G.K.Crane (Southern California Edison Co., Rosemead, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.203-4
While water-dominated geothermal resources with potential for large scale power generation have been known to exit in Southern California for many years, they have not yet been commercially developed. The Company as well as other utilities and resource production companies have made major commitments to the development of geothermal resources located in the Imperial Valley. Edison's program includes the construction of three flash steam power plants with varying objectives and designs which will assist in assessment of the feasibility of hot water geothermal as a base load generation option. (no refs.)

103646 Efficiency of geothermal energy use in a non-electrical application. A.Naimpally (California State Univ., Long Beach, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.205-9
Using the thermodynamic concept of 'energy availability', a study of the efficiency of geothermal energy usge in evaporators is performed. On the assumption that the percentage of material being evaporated is constant, material and energy balances are performed for the evaporator. The standard thermodynamic definition of the 'energy availability function' is utilized to obtain an expression for the 'amount of feed processed in the evaporator per unit loss of energy availability', as a function of the temperature drop in the evaporator. The results are shown in graphical form. (3 refs.)

86.10K Solar energy

103647 Power from the Sun. Solar voltaic power in the field of rural development.
Zimbabwe Eng., vol.21, no.2, p.XXVII-XXXVII (March 1983).
Solar installations are now the most economic sources of power for certain operations in the rural areas. Analysis of the relative costs of solar energy and its competitors has shown that although the initial capital cost of the solar module is more than four times that of a diesel alternative, the difference can be recovered in four years (assuming no increase in diesel costs) as a result of the high operating expenses of alternative forms of energy. The design life of a solar panel is more than 20 years, in contrast to ten years for a diesel engine. (no refs.)

103648 Solar energy—its contribution to the future energy supply of the Federal Republic of Germany. C.-J.Winter, J.Nitsch, H.Klaiss.
Brennst.-Waerme-Kraft (BWK) (Germany), vol.35, no.5, p.243-54 (May 1983). In German.
The utilization of solar energy and the rational energy use are for the Federal Republic of Germany economic energy and environmental—politically advantageous energy supply strategies. Its potential and its range of use for the low-temperature heat and electricity supply are introduced. Speed of construction and market share are dependent on structural threshold conditions, technical progress and price development of conventional energy carriers. These dependences are mentioned. The investigations come to the conclusion that up to the year 2000 rational energy use, especially, heat insulation measures, will be the most effective means for reducing the demand for fossil energy carriers. Beyond the year 2000 regenerative energy sources can constitute up to 20 per cent of the primary energy consumption of the Federal Republic of

Germany. Furthermore, solar energy in the form of imported hydrogen from countries with high solar radiation can contribute to meet the demand. (42 refs.)

103649 Australian coal resources and its market perspective. R.R.Vine. *Electr. Energ.-Electron. (Portugal),* no.188, p.258-60 (June 1983). In Portuguese.
The paper discusses the Australian coal industry and the possibility of exports filling Portuguese requirements. A few brief details are given of known Australian resources in Queensland and New South Wales. The control of these between Federal and State governments is explained. Present annual production is given as 90 million tonnes, including 51 millions for export. The export fields are briefly discussed, including the very important European market. This is made attractive by the wide variety of Australian coal types available to suit most customers. At present 80% of Australian electricity production is based on coal. The storage and shipping infrastructures are described briefly. The Australian coal export industry is private but the government keeps a watching eye on market prices. Some recent coal industry activities in Australia are described. (no refs.) *G.V.D.*

103650 Economics of solar water heating in private households. G.Bergmann (Philips GmbH Forschungslab. Aachen, Germany).
Energiewirtsch. Tagesfragen (Germany), vol.33, no.7, p.443-7 (July 1983). In German.
Discusses cost of solar heating for domestic hot water systems, with formulae and tables of results and comparisons with heat pumps and conventional systems. Yields of 425 kWh/m^2 (annual average) can be achieved. The collector surface required is 1 m^2/person and the installation costs work out as DM 9000 for the average family using 3000 kWh per year. (13 refs.) *J.S.*

103651 Optimum power from a solar thermal power plant using solar concentrators. T.C.Kandpal, A.K.Singhal, S.S.Mathur (Centre for Energy Studies, Indian Inst. of Technol., New Delhi, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.103-6 (1983).
In this paper, the optimum temperature of operation of a solar concentrator and thus the maximum power obtained from a solar thermal power plant has been calculated. Results are plotted graphically and discussed. (no refs.)

103652 The case for solar/hydrogen energy. W.J.D.Escher (E.F. Technol., St. Johns Inc., MI, USA).
Int. J. Hydrogen Energy (GB), vol.8, no.7, p.479-98 (1983).
The Hydrogen Energy System concept is overviewed as background. A 'Solar/Hydrogen Systems Assessment' (vol.7, p.3, 1982) delineated early-availability systems based on photovoltaic, thermal/heat-engine, wind and hydropower solar conversion, and associated water electrolysis to yield product hydrogen and oxygen as 'hydrogen energy'. Most significant, both small-scale (local, dispersed) and large-scale (central, remote) solar/hydrogen generation facilities can be established in balance with prevailing societal-selection dictates. Involving a readily storable, transportable 'energy currency', existing hydrogen-energy systems can be inter-tied as desired, provided load-management-related economic advantages to both the energy-user and the 'energy utility' of that era. Future solar/hydrogen-electric residences might, buy and sell hydrogen and electricity in a 'grid-cooperative' arrangement. The salient operative question concerns the efficacy of 'conventional wisdom' in the energy free-market decision-making process. In an aura of business-as-usual, solar/hydrogen's timely contribution to 'picking up the load' from exhaustible fossil fuels in the face of still-escalating world energy demand is judged most problematic. An unprecedented cooperative world effort for the research, development, demonstration and deployment of solar hydrogen energy delivery capabilities is suggested. (13 refs.)

103653 On the use of solar energy. J.Gosse.
Rev. Energ. (France), vol.34, no.354, p.264-9 (May 1983). In French.
Solar energy was in current use by the experimental workers of the 18th century, and during the 19th century, notably through the efforts of Mouchot, aroused great interest through its industrial applications. However, the ease of use of hydrocarbons blocked further development. The difficulty of choosing any particular type of installation is described; it depends on assessment of a range of criteria whose characteristics are fundamentally different, and the relative importance to be attached to each depends on the decision-maker. The final choice is in the end a compromise based on circumstances. A simple method is defined for assessing the energy value of an installation. It is shown that a generating station using primary energy from planetary resources has an energy value dependent on the yield of the transformation from primary energy into usable energy. In the case of solar energy, the value, or profitability, is dependent on the energy investment required, principally for the manufacture of the equipment. (11 refs.)

103654 Theoretical concentration of solar radiation by central receiver systems. T.Sakurai, Y.Shibata (Tohoku Univ., Sendai, Japan).
Sol. Energy (USA), vol.31, no.3, p.261-70 (1983).
Solar concentrations by central receiver systems have been calculated theoretically for various values of obliquity of the incident radiation, assuming that plane heliostat-mirrors, sufficiently small in dimension, cover a circular field without clearance. Through this calculation, the performance characteristics of this system such as the availability of the radiant energy incident on the heliostat-field, the distribution of interruption by an adjacent mirror, the optimum rim-angle for the mean area- and the mean volume-concentration and the attainable temperature were revealed. The study was extended towards the practical problem of decreasing the number of heliostats by increasing the dimensions of heliostat-mirrors, and the effect of increasing mirror-dimensions was argued for both plane and curved mirrors. (6 refs.)

103655 Development of a point focusing collector farm system. G.Schmidt, P.Schmid, H.Zewen, S.Moustafa (Messerschmitt-Bolkow-Blohm GmbH Space Div., Munchen, Germany).
Sol. Energy (USA), vol.31, no.3, p.299-311 (1983).
A parabolic collector and thermal test loop has been operated and a small solar farm is under construction in Kuwait. Some experiences gained in the analysis and design of solar farm systems are summarized. Derived from this experience, possible future development trends of such farm systems using point focusing paraboloid collectors are outlined. (4 refs.)

103656 Statistical comparison of models for estimating solar radiation on inclined surfaces. C.C.Y.Ma, M.Iqbal (Dept. of Mech. Engng., Univ. of British Columbia, Vancouver, Canada).
Sol. Energy (USA), vol.31, no.3, p.313-17 (1983).
The objectives of this study are to compare statistically three models for estimating solar radiation on inclined surfaces and to recommend one that is general and accurate. The isotropic model, and Klucher's and Hay's anisotropic models are chosen for discussion. The hourly and daily formulations of these models are briefly described. Results show that they all produce large errors at steep slopes. The errors are minimum during the summer months. The isotropic model under-estimated consistently throughout the year resulting in the worst performance. Hay's model also under-estimated constantly but by a smaller amount. Klucher's model over-estimated in the summer and under-estimated in the winter, but can be considered just as general and accurate as Hay's model for estimating insolation on inclined surfaces. (3 refs.)

103657 Proportioning composites for efficient thermal storage walls. T.R.Knowles.
Sol. Energy (USA), vol.31, no.3, p.319-26 (1983).
Thermal storage walls for use in passive solar collectors are analyzed with the purpose of establishing guidelines for the design of low-mass, high-efficiency walls. Numerical results for the efficiency of thermal transfer are shown to be well approximated by a simple, stationary-state formula, with which general design objectives are identified, in particular the desirability of materials having prescribed thermal heat capacity and conductivity. The required proportioning of metals, masonry and phase change materials to yield materials with such properties is determined for the case of parallel layering. Illustrations of binary and ternary composites are presented. Compared with concrete, paraffin-metal mixtures are found to offer thermal storage walls having a 90 per cent reduction in storage mass and a 20 per cent relative increase in efficiency. (8 refs.)

103658 A simple analysis of an open regeneration system. P.Gandhidasan (Dept. of Mech. Engng., Univ. of the West Indies, St. Augustine, Trinidad).
Sol. Energy (USA), vol.31, no.3, p.343-5 (1983).
Liquid desiccants have great potential for use in solar energy applications such as heating and cooling of buildings, crop drying, power generation, etc. In all such applications the spent absorbent solution must be concentrated for reuse. Different methods of regenerating the weak solutions using solar enegy have been discussed. One the simplest methods is the open surface regeneration system. Recently for an open regeneration system, Collier (1979) derived an expression to calculate the amount of water evaporated from the weak solution. In this derivation the variation of the rate of evaporation of water along the flow length of the open regenerator has been taken into consideration. The analysis is somewhat complex. It is shown in this note that a simple expression can be derived for the rate of evaporation of the water if it is assumed that the temperature, concentration and vapour pressure are constant at the arithmetic average of these values at the beginning and end of the regenerator. (6 refs.)

103659 Solar heating of municipal pools. G.T.Gordon, G.G.Henkel.
Trans. Inst. Eng. Aust. Civ. Eng. (Australia), vol.CE25, no.2, p.135-42 (May 1983).
In an era of rising energy costs the use of solar energy for the heating of municipal pools is becoming increasingly attractive. The season for open pool swimming is limited in southern Australia because water temperatures fall below comfort conditions. Solar energy is readily available over the summer period, when high efficiencies are achievable using simple solar systems. The feasibility of solar pool heating is influenced by climate, cost and likely trends in cost increases of conventional fuels, the capital cost of a solar system, interest rates and inflation. It is important that any feasibility study considers life cycle costing and a range of conventional fuel cost increases. If fixed annual costs of a capital intensive solar installation can be contained below the likely conventional energy costs then solar energy is economic and this can be greatly assisted by an inflationary economic climate. In Canberra two solar pool heating installations have been set up as solar demonstration municipal pool heating projects. One uses unglazed collectors for an outdoor pool; the other uses glazed collectors for an indoor pool. Feasibility studies have been undertaken on heating the municipal pools in Canberra and a range of alternative energy approaches has been considered. The paper outlines the design approach used and the results of the work undertaken in Canberra for the NCDC. It demonstrates the economics of a range of options available for the heating of municipal pools and provides technical information for design application. (8 refs.)

103660 Feedback control of the primary circuit of a solar power plant. L.Carotenuto, M.La Cava, G.Raiconi (System Dept., Univ. of Calabria, Cosenza, Italy).
Control of Distributed Parameter Systems 1982. Proceedings of the Third IFAC Symposium, Toulouse, France, 29 June-2 July 1982 (Oxford, England: Pergamon 1983), p.461-7
Considers the problem of closed loop stability of the primary circuit of a solar power plant equipped with a feedback control scheme with the purpose of eliminating the effect on the output temperature of residual disturbances not cancelled by already existing control actions. Because the model of the plant with flow control is typically bilinear the stability analysis of the whole feedback control system is worked out through the extension of Lyapunov techniques to distributed parameter systems. To simplify the computation of the stabilizing feedback control a finite-dimensional approximation of the continuous model, involving a fixed discretization of the spatial domain is introduced. Two different time discretization schemes are considered: the first based on the finite difference method and the second on the method of characteristics. For each of the considered discrete models a class of stabilizing controls is obtained; among them particular attention is given to some specifical laws which are able to optimize a suitable performance index for the system. Several examples are finally worked out, which show the efficiency of the proposed control schemes both in response to typical disturbances and in presence of plant parameter variations. (8 refs.)

103661 Solar energy. D.J.Close, R.E.Collins, M.Kingsmill, W.R.Read, L.G.Turner, E.A.Woodley.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.265-73
In this paper the emphasis has been placed on policy implications rather than a detailed survey of technical advances or requirements. Considerable attention has been paid to the recommendations for an energy policy for Australia and the information on which these were based, and some qualifications are noted. Funding arrangements for research, development and demonstration through NERDDC and various state committees are described in detail, and financial incentives and disincentives to the use of solar equipment are discussed. (17 refs.)

103662 Heliostat control systems. W.G.Hart (Martin Marietta Corp., Baltimore, MD, USA).
24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood, CA, USA: Western Periodicals 1981), p.715-19
Describes the control system for the heliostats that will be installed at the 10-MW solar thermal central receiver pilot plant at Barstow, its evolution from the heliostat control system in use at the central receiver test facility in Albuquerque, and development work on future systems. The following topics are covered: distributed computer system for overall control of the field of heliostats; stability and control of individual heliostats; pointing accuracy requirements and error allocations; load torque requirements; power and energy requirements; and cost considerations. (no refs.)

103663 Solar central receiver technology—what has been learned in the 70's. R.W.Hughey (US Dept. of Energy, Washington, DC, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.37-8
During the decade of the 70s, the Solar Central Receiver concept progressed from an engineering curiosity to a very promising potential alternative to fossil fuel as a major energy source for the USA. Plans for the next three stages (demonstration, market development and eventual commercialisation) are outlined briefly. (no refs.)

103664 Power from parabolic dishes: progress and prospects. V.C.Truscello, A.N.Williams (Solar Thermal Power Systems Project, Jet Propulsion Lab., Pasadena, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.39-43
Summarizes the status of parabolic dish technology in the fiscal year 1980 and comments on its future prospects. Performance projections for dish modules and the progress of the engineering experiments to be deployed in user environments are given primary emphasis. The developments in dish technology and in the engineering experiments serve as indicators of progress toward eventual commercial readiness. (no refs.)

86.10N Nuclear energy

103665 Nuclear energy. J.L.Symonds, A.King, J.O.Reynolds, H.Saddler, R.K.Warner, R.E.Wilmshurst.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.236-48
This paper reviews the world nuclear energy scene as it affects Australia and its mining and uranium treatment industries. The prospects for new industries are discussed in the light of changes in legislation and regulations required, their demand for human resources and skills, and any impact which such industries may have on communities either socially or environmentally. (36 refs.)

86.30 ENERGY CONVERSION

86.30E Primary cells

103666 Solid electrolyte interphase (SEI) electrodes VI: calcium-$Ca(AlCl_4)_2$-sulfuryl chloride system. E.Peled, R.Tulman, A.Meitav (Dept. of Chem., Tel-Aviv Univ., Tel-Aviv, Israel).
J. Power Sources (Switzerland), vol.10, no.2, p.125-35 (July 1983).
The electrochemistry of the $Ca/Ca(AlCl_4)_2$-sulfuryl chloride (SC) system and its capability of functioning as a primary cell were studied. The OCV of this cell is about 3.4 V and it exhibits a rather flat discharge curve of 3.1-2.9 V at current densities of 0.4-2.0 mA cm^{-2}. Cell capacity is 35-45 mA h cm^{-2} (for 1.1 mm thick porous carbon cathodes). Cell failure results from anodic polarization. Cells were found to resist charging and reversal abuses and no indication of calcium deposition during reversal was found. It was found that the calcium anode is covered by a thin film (most likely $CaCl_2$) which serves as a SEI. Its thickness on fresh electrodes is about 15-30 Å and it increases with time. The rate determining step for the calcium dissolution process is the ionic migration through the SEI. The ionic resistivity of the SEI is about 4×10^9 Ω cm. (18 refs.)

103667 A possible mechanism for the reduction of voltage delay in the $Li/SOCl_2$ system via cyanoacrylate coatings. N.A.Fleischer, R.J.Ekern (RAYOVAC Corp., Madison, WI, USA).
J. Power Sources (Switzerland), vol.10, no.2, p.179-89 (July 1983).
Scanning electron microscopy and X-ray photoelectron spectroscopy were used to investigate the passivation of lithium treated with alkyl 2-cyanoacrylates in $LiAlCl_4/SOCl_2$ electrolyte. Cyanoacrylate coatings reduce anode polarization by affecting the morphology and growth kinetics of the LiCl passivating film. The mechanism for these effects depends on the gradual dissolution of the coating in electrolyte and its subsequent replacement by LiCl. Dissolving either the monomer or polymer form of cyanoacrylate directly into the electrolyte without coating the lithium also effects LiCl film growth and reduces polarization. (17 refs.)

103668 On the suppression of self discharge of the zinc electrodes of zinc-air cells and other related battery systems. C.Chakkaravarthy, H.V.K.Udupa (Central Electrochem. Res. Inst., Karaikudi, India).
J. Power Sources (Switzerland), vol.10, no.2, p.197-200 (July 1983).
Describes a simple procedure to determine the mercury content, without resorting to any analytical procedure, in the chemically amalgamated zinc electrode. The effect of mercuric ion concentration and immersion time on the amalgamation of the zinc electrode is also shown. A simple alloying method is described as an alternative to the one reported by Bernard (Brit. Pat. 182, 466, 1970) who enclosed mercury in a thick-walled zinc capsule and submerged it in molten zinc. The ampere hour outputs of a few experimental 1.4 V, 50 A h zinc-air alkaline cells are given to show that the alloying procedure is more effective than the chemical method, especially when the amalgamated zinc is stored prior to use. (3 refs.)

103669 Lithium batteries for memory preservation. D.Linden.
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.29/1/1-2
Lithium is very attractive as a battery anode material because of its lightweight, high voltage and high electrochemical equivalence. Lithium batteries are rapidly becoming an important power source for a variety of applications because of their many performance advantages over conventional batteries. They have particular advantages with regard to their application as a back-up power source for volatile RAM devices to obtain a nonvolatile memory system. The characteristics of high performance lithium batteries are discussed, and a listing of typical primary cells and their nominal voltages given. (no refs.)

103670 New lithium batteries for memory preservation. R.E.Ralston (Lithium Systems Div., Duracell Internat. Inc., Elmsford, NY, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.29/2/1-8
A number of new lithium primary batteries are now available for use as a back-up battery for memory preservation. These high performance batteries are small in size, compatible for PC board installation, have superior shelf life characteristics and meet the specific needs of memory applications. The author discusses these points and the design of three different types of lithium batteries. (no refs.)

103671 Characteristics of lithium solid state batteries in memory circuits. S.J.Garlock (Instrument Div., Lear Siegler Inc., Grand Rapids, MI, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.29/3/1-8
The need for non-volatile random access memory has lead to the use of CMOS memories with a battery supplying the power needed to continue memory retention when main power is no longer available. The use of a battery in the harsh aviation environment necessitates a careful evaluation of a battery's ability to consistently supply power at various loads over extreme temperature ranges under severe environmental stress and still afford personnel and equipment safety. The author details the criteria and procedure for evaluating lithium solid state batteries. (no refs.)

103672 The use of lithium batteries in memory circuits. L.H.Fentnor, L.A.Schaum (Battery Engng., Hughes Aircraft Co., Tucson, AZ, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.29/4/1-3
Hughes Aircraft Company (HAC) has been and is currently supplying the electronics utilized in the F-15 landing computer. This design requires the incorporation of a standby power source (battery) to preserve the semiconductor memory system of this electronic design. The authors describe the power requirements for the HAC design and presents typical performance capabilities of the lithium-anode/lead-iodide+lead-sulphide cathode chemical system; and, the performance capabilities of lithium-anode/thionyl-chloride cathode chemical systems manufactured by three leading battery producers. (no refs.)

103673 Lithium thyonyl chloride batteries for memory preservation. G.Giveony, B.Ravid (Tadiran Israel Electronics Industries Ltd., Rehovot, Israel).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.29/5/1-9
Lithium inorganic (thionyl chloride) batteries provide an ideal solution to designer's requirements for a battery to backup static CMOMS RAM's in order to achieve a nonvolatile memory. The lithium inorganic battery offers such advantages as high voltage, high energy density, ten-year life expectancy, extreme temperature range endurance and safety. Examples from telecommunication, communication, telephony, instrumentation and industrial controls demonstrate the implementation of the lithium inorganic battery in the design of nonvolatile CMOS memories. The upgraded performance of the equipment in which the battery and the nonvolatile memory are being used is described. (4 refs.)

86.30F Secondary cells

103674 Beta-alumina for sodium-sulphur batteries. A.Wicker (CGE, Lab. de Marcoussis, Marcoussis, France).
Ind. Ceram. (France), no.772, p.352-5 (1983). In French.
Aims to review the state-of-the-art concerning the use of beta-alumina ceramics as a solid electrolyte in the sodium-sulphur battery. Design and operating conditions of a sodium-sulphur cell are first outlined leading to specifications for beta-alumina tubes. The various fabrication procedures which have been studied are presented with regard to powder preparation, shaping and sintering. The major problem encountered by the beta-alumina developers is the in-cell durability of the electrolyte tube. Studies on the electrical breakdown which is the main cause of failure have been recently emphasized: failure is usually associated with the penetration or the formation of sodium in the electrolyte or as a general blackening extending from the sodium side. To solve this problem further research and development on improving the durability and the reliability of beta-alumina tubes are needed. (42 refs.)

103675 Mathematical analysis of a Zn/NiOOH cell. H.Gu (Electrochem. Dept., General Motors Res. Lab., Warren, MI, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1459-64 (July 1983).
A mathematical model has been developed to predict the time dependent behavior of a Zn/NiOOH cell. The model uses experimentally determined polarization expressions to describe the losses between the positive and the negative electrodes. The electronic losses in the plane of the electrode are simulated by a network of resistors. The potential distribution, and current distribution, the cell voltage, the power capability, and the energy of a cell can be predicted. The mathematical model provides an analytical tool to evaluate, for example, the trade-offs between power capability and current collector mass, needed to design an electric vehicle battery. (5 refs.)

103676 Study of a lithium-lithium propionate electrode in propylene carbonate. J.M.S.Saltao, C.A.C.Sequeira (Lab. de Electroquimica, Inst. Superior Tecnico, Lisbon, Portugal).
J. Power Sources (Switzerland), vol.10, no.2, p.111-23 (July 1983).
Preliminary data are presented on the electrochemical behavior of a secondary lithium electrode in propylene carbonate at 25°C. The anion of the insoluble lithium propionate salt, whose precipitation is favored by the anodic dissolution of lithium, was introduced into the solvent as a tetrabutylammonium salt. Steady-state potentiostatic polarization curves, anodic galvanostatic, and cyclic voltammetry measurements provided information on the kinetics of the lithium system. It was shown to be reversible, provided that the overpotential does not exceed 60 mV, and may be able to deliver current densities of the order of 0.25 mA/cm^2 without appreciable polarisation. Consideration of the reduction of the electrolyte on platinum and lithium electrodes is also discussed. (16 refs.)

103677 Accelerated cycle life testing of lead-acid golf car batteries and the influence of separator type on battery life, energy consumption and operating cost. B.S.Goldberg, A.G.Hausser, B.T.Le (Tech. Center, Amerace Corp., Butler, NJ, USA).
J. Power Sources (Switzerland), vol.10, no.2, p.137-48 (July 1983).
Commercial lead-acid golf car batteries containing five different separator materials were cycle life tested. An accelerated cycle life test was employed in which the battery temperature was allowed to rise as the batteries became less efficient in power utilization towards the end of life, and there was no rest period between charge and discharge during cycling. The effects of continuous cycling and separator type on battery performance were monitored throughout the test together with battery temperature, end of charge current, energy balances, and capacity. Cycle life test data through correlation with actual expected life in the field allowed calculations to be made to determine the relative effective operating cost of various battery types. The battery made with FLEX-SIL rubber separators exhibited the best life and economics when compared with batteries containing ACE-SIL rubber, polyethylene, cellulose (paper), and sintered PVC separators. (5 refs.)

103678 Computer-controlled multiple-channel system for electrochemical experiments. M.H.Katz, J.T.Nichols, F.R.McLarnon, E.J.Cairns, J.E.Katz (Lawrence Berkeley Lab., Berkeley, CA, USA).
J. Power Sources (Switzerland), vol.10, no.2, p.149-65 (July 1983).
A test system has been designed and constructed to allow the simultaneous and continuous cycling of 16 electrochemical cells, and the system can be readily expanded to accommodate 48 cells. It is configured with eight independent current-control units, each dedicated to two series-connected cells, and the cells can be driven by single charge and single discharge power supplies. The current controllers have a resolution and stability within 0.025% of full scale, and a response time constant of 1 ms. The charge and discharge profiles, including pulse charging and EPA power profile discharging, are implemented through the use of various computer algorithms. (11 refs.)

103679 Structural effect of the zinc electrode on its discharge performance. T.S.Chang, Y.Y.Wang, C.C.Wan (Dept. of Chem. Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Power Sources (Switzerland), vol.10, no.2, p.167-77 (July 1983).
The formation conditions in the preparation of zinc electrodes for the nickel-zinc battery were varied to obtain different electrode structures. The porosity and pore size distribution of the zinc electrode were found to be dominant factors in determining the electrode capacity. The optimal porosity was estimated to be about 0.64. (18 refs.)

86.30G Fuel cells

103680 Coal gas as a feed fuel for phosphoric acid fuel cell power plants. B.R.Krasicki, B.L.Pierce (Advanced Energy Systems Div., Westinghouse Electric Corp., Pittsburgh, PA, USA).
Int. J. Hydrogen Energy (GB), vol.8, no.7, p.499-508 (1983).
The effects of a number of coal gasification systems and their gas compositions on a 7.5 MW$_{(e)}$ DC Phosphoric Acid Fuel Cell (PAFC) power plant are assessed. Both low and medium BTU synthesis gases were considered from various promising gasification processes. Degree of development or commercialization, technical complexity, availability and coal restrictions were taken into account. System studies performed on the plant for nonintegrated and integrated fuel conditioning systems are discussed for the various gasification processes. Representative characteristics for the derived coal gases and PAFC system performance data are presented. The direct capital costs of the PAFC power plant are evaluated for each system. (2 refs.)

103681 Status of solid polymer electrolyte fuel cell technology and potential for transportation applications. L.J.Nuttall, J.F.McElroy (General Electric Co., Electrochem. Energy Conversion Programs, Wilmington, MA, USA).
Int. J. Hydrogen Energy (GB), vol.8, no.8, p.609-15 (1983).
The solid polymer electrolyte fuel cell technology was used to provide electrical power for two operational spacecraft programs, and development programs span a wide range of applications which include ground power and undersea, as well as advanced space systems. The technology is also finding applications in the areas of water electrolysis and chlor-alkali production. During 1981 a study was conducted for the Los Alamos National Laboratory to determine the feasibility of using this technology for vehicular propulsion. The results of the study show that, with adequate development, such a power plant is possible which will meet the performance, size and weight objectives. It is also estimated that the costs for such a system could be competitive with other potential advanced power systems. (1 ref.)

86.30J Photoelectric conversion: solar cells and arrays

103682 New promise for photovoltaics. R.Whitaker.
EPRI J. (USA), vol.8, no.6, p.6-15 (July-Aug. 1983).
Looks at the R&D in the photovoltaics industry in the fields of amorphous silicon, single-crystal silicon in ribbon form, concentrating systems and polycrystalline silicon and other materials. The present status of solar cells manufactured with materials in these forms in terms of efficiency and economics is pointed out and the potential for the generation of large scale power using these technologies in the future is discussed. (4 refs.)

103683 Economic aspects of the utilization of solar energy by means of solar cells. R.Dahlberg (AEG Telefunken AG, Heilbronn, Germany).
Energiewirtsch. Tagesfragen (Germany), vol.33, no.7, p.453-8 (July 1983). In German.
Discusses the economics of solar generators and solar hydrogen power stations, with detailed calculation of costs of installation and operation, and comparison with conventional power supply systems. Only the solar hydrogen power system has a chance of becoming a genuine alternative source of energy. (4 refs.) *J.S.*

103684 Parameters of solar cell arrays. M.Shechter (Tel-Aviv Univ., Tel-Aviv, Israel), J.Appelbaum, G.Yekutieli.
IEEE Trans. Electron Devices (USA), vol.ED-30, no.6, p.616-18 (June 1983).
Presents an analytically derived method of combining nonidentical solar cell parameters to obtain a single-exponential approximation for an array. It is assumed that the array *I-V* equation is of the same form as that of the single cell. The array possesses two photocurrents: one at the open circuit voltage and the other depends on load current. (5 refs.)

103685 Two-dimensional modeling of the MIS grating solar cell. P.de Visschere (Lab. voor Elektronika, Rijksuniv. Gent, Gent, Belgium).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.840-9 (July 1983).
A two-dimensional model has been developed for simulating the behavior of a metal-insulator-semiconductor (MIS) grating solar cell. In contrast with traditional methods, which solve the nonlinear semiconductor equations directly, this model solves a derived nonlinear boundary value problem, using an integral equation technique. The general characteristics of MIS grating solar cells have been calculated and are explained in terms of the underlying physical processes. In order to gain a better understanding of the collection mechanism taking place in a grating solar cell, a new concept, the 'diffusion thickness of the space-charge layer' is introduced. The best-known grating solar cell is the MIS inversion layer solar cell. However, it is shown that for common values of the surface charge, an inversion layer cell with a low base doping level may not have as high an efficiency as a cell with a more heavily doped base, in which the minority-carrier flow is two-dimensional. (34 refs.)

103686 Solar cell efficiency calculations using an average absorption coefficient. B.Kallback (Inst. of Microwave Technol., Stockholm, Sweden).
Int. J. Electron. (GB), vol.55, no.2, p.299-302 (Aug. 1983).
Efficiency calculations have been performed for an n$^+$p-solar cell with reflecting back surface, using an average absorption coefficient. The relevance of using an average absorption coefficient is examined by comparing the result with calculations for a wavelength dependent absorption coefficient. (4 refs.)

103687 Sizing an autonomous photovoltaic installation. II.. J.-A.G.de Andoain.
Mundo Electron. (Spain), no.130, p.159-66 (July 1983). In Spanish.
For pt.I see ibid., no.128, p.113-19 (1983). Despite many articles on sizing autonomous photovoltaic installations, no clear advances in the development of a sizing theory have emerged yet; specially in an oversizing theory. The paper initiates a series of articles which are intended to break classical methods of iterative sizing, opening a discussion in new fields whose interest is focused on its operativeness and to propose a theory which covers subjects such as: the dependence of accumulation with oversizing, the cost function for oversizing, the system autonomy and oversizing, among other topics of interest. (no refs.)

103688 Electron irradiation effects on amorphous silicon solar cells. M.Katayama, H.Morimoto, K.Sugawara (Solar systems Group, Sharp Corp., Nara, Japan).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K5-8 (16 July 1983).
The authors study the electron irradiation effects on a-Si solar cells. The irradiation tests were performed for a-Si:H:F solar cells by exposing them in 1 MeV electron beams, with fluences up to 10^{16} e/cm^2. The solar cells were fabricated onto stainless steel substrate of thickness 0.2 mm. (7 refs.)

103689 Characterization of grain boundaries in polycrystalline solar cells using a computerized electron beam induced current system. C.Donolato (CNR-Istituto Lamel, Bologna, Italy), R.O.Bell.
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1005-8 (Aug. 1983).
The automatic evaluation of grain boundary activity in a polycrystalline solar cell can be carried out by interfacing a microcomputer to a scanning electron microscope operating in the electron beam induced current mode (EBIC). The grain boundary surface recombination velocity and diffusion length in the neighboring grains are obtained by digital acquisition and processing of the related EBIC profile. The technique is applied to the evaluation of hydrogen passivation of a ribbon solar cell. (11 refs.)

103690 Stability of p-i-n hydrogenated amorphous silicon solar cells to light exposure. Y.Uchida, M.Nishiura, H.Sakai, H.Haruki (Fuji electric Corporate Res. & Dev. Ltd., Yokosuka, Japan).
Sol. Cells (Switzerland), vol.9, no.1-2, p.3-12 (June-July 1983).
Light-induced and forward bias current effects were studied on p-i-n hydrogenated amorphous silicon (a-Si:H) solar cells with various i layer thicknesses. The indium tin oxide ($In_{2-x}Sn_xO_{3-y}$)/(p-i-n)/stainless steel (SS) solar cell is stable to light exposure in comparison with the $In_{2-x}Sn_xO_{3-y}$/(n-i-p)/SS solar cell. The degradation of the cell is less when its i layer is thinner. Doping the i layer with a small amount of boron makes the cell quite stable to light exposure. These results suggest that the light-induced effects can be controlled by choosing an appropriate junction structure and junction formation technique. The change in performance of the $In_{2-x}Sn_xO_{3-y}$/(n-i-p)/SS cell after forward current biasing in the dark depends on the i layer thickness, similarly to the light-induced performance change. In contrast, a slight enhancement in the performance is observed for the $In_{2-x}Sn_xO_{3-y}$/(p-i-n)/SS cell after forward current biasing. Environmental tests show that the encapulsated a-Si:H solar cells withstand temperatures of up to 100°C and high humidities (60°C, 95% relative humidity). (11 refs.)

103691 Light-induced effects in indium tin oxide/n-i-p hydrogenated amorphous silicon solar cells. M.-K.Han, W.A.Anderson (Dept. of Electrical & Computer Engng., State Univ. of New York, Amherst, NY, USA), H.Wiesmann.
Sol. Cells (Switzerland), vol.9, no.1-2, p.13-17 (June-July 1983).
Light-induced effects have been studied on hydrogenated amorphous silicon solar cells having an air mass 1 efficiency of 5%-7% and an area of 0.1-0.2 cm^2. Within 72 h of illumination the open-circuit voltage did not decrease while the fill factor decreased from 0.6 to 0.4 and the short-circuit current density decreased from 11.5 to 10.5 mA cm^{-2}. The increased shunt current is found to be critical to the device performance of degraded cells. The increased shunt current may be due to an increased surface recombination velocity. The series resistance was almost unchanged. Annealing in air at 150°C restored much of the efficiency loss previously caused by light-induced effects. (5 refs.)

103692 Light-induced instability of amorphous silicon photovoltaic cells. S.Tsuda, N.Nakamura, K.Watanabe, T.Takahama, H.Nishiwaki, M.Ohnishi, Y.Kuwano (Res. Centre, Sanyo Electric Co. Ltd., Osaka, Japan).
Sol. Cells (Switzerland), vol.9, no.1-2, p.25-36 (June-July 1983).
Changes in the characteristics of amorphous silicon (a-Si) solar cells caused by light exposure were studied. The degradation ratio of the conversion efficiency of p-i-n a-Si solar cells caused by light exposure depends on the thickness of the i-layer. A decrease in the fill factor was commonly observed, and in such cases the diode quality factor and shunt current density increased, which suggested a change in junction properties. It was shown that additional doping of the i-layer with a small amount of boron prevents the decrease in conversion efficiency with light exposure. In a 1 year experiment on a 2 kW a-Si power generating system, a 10% decrease in conversion efficiency was observed (without additional boron doping). (7 refs.)

103693 Effects of optical stress on the properties of sputtered amorphous silicon solar cells and thin films. H.P.Maruska, T.D.Moustakas, M.C.Hicks (Exxon Res. & Engng. Co., Corporate Res. Labs., Linden, NJ, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.37-51 (June-July 1983).
Sputtered amorphous silicon solar cells and thin films (four-point probe specimens) were deposited under a variety of conditions differing in hydrogen concentration, target voltage and substrate temperature. The samples were subjected to as long as 400 h of simulated air mass 1 illumination. Some of the cells retained essentially stable values of short-circuit current density J_{sc}, while others did not. Losses in J_{sc} were not simply due to increases in series resistance, and the spectral repsonses were altered. A low temperature anneal restored the initial state. No significant changes were noted in the open-circuit voltage V_{oc}. Analysis of space charge current densities in the cells gave an indication of the increased densities of midgap states following the stress. It was not possible to correlate the changes in cell performance with the controlled deposition conditions, and impurities may play a part. The conductivity changes measured in gap cell structures do not correlate with the observed changes in solar cell structures, possibly because of contributions from the surface conductivity. (16 refs.)

103694 Analysis of photoinduced changes in the performance of amorphous silicon solar cells. Y.Tawada, K.Nishimura, S.Nonomura, H.Okamoto, Y.Hamakawa (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Sol. Cells (Switzerland), vol.9, no.1-2, p.53-61 (June-July 1983).
Photoinduced changes in the performance of a-SiC:H/a-Si:H (where a-SiC:H and a-Si:H denote hydrogenated amorphous SiC and silicon) heterojunction solar cells were investigated under illuminations of 1 sun and 10 suns. The fill factor and the conversion efficiency decreased sharply with time under 10 suns illumination. In order to separate the origin of the photo-induced fill factor change from thermal effects on the fill factor, the temperature dependence and heat-treatment-induced recovery of the cell performance were also studied. With these systematic data, a series of experimental and theoretical analyses were carried out using the variable minority carrier transport model. The results show that the photo-induced changes are caused not only by the bulk Staebler-Wronski effect but also by changes in the surface recombination factor. (15 refs.)

103695 Properties of the defect causing solar cell degradation. R.S.Crandall, D.L.Staebler (RCA Labs., Princeton, NJ, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.63-74 (June-July 1983).
Using a combination of transient solar cell degradation and deep level transient spectroscopy measurements of p-i-n (where i denotes an intrinsic layer) and Schottky barrier hydrogenated amorphous silicon solar cells it is shown that a deep electron trap having nearly the same energy for electron capture or release is responsible for many of the aspects of solar cell degradation. The chief effect of this trap, which has a small electron capture cross section at room temperature, is to capture electrons from the conduction band and to transfer them to metastable states outside the energy gap, thus changing the Fermi level. (27 refs.)

103696 The CdS-CuInSe$_2$ solar cell interface: thermodynamic considerations. J.F.Wager, O.Jamjoum, L.L.Kazmerski (Solar Energy Res. Inst., Golden, CO, USA).
Sol. Cells (Switzerland), vol.9, no.3, p.159-68 (Aug. 1983).
Simple thermodynamic arguments are used to investigate the oxidation of CuInSe$_2$ and the possible chemical reactions at the CdS-CuInSe$_2$ interface. Reaction products are predicted for the oxidation of CuInSe$_2$ and the oxidation of CdS and for reactions between CdS and CuInSe$_2$, as well as between CdS and the CuInSe$_2$ native oxide. It is suggested that the oxidation of CdS is possibly associated with the partial improvement in the response of CdS-CuInSe$_2$ solar cells with annealing treatments in an oxygen ambient. (14 refs.)

103697 Low cost process for ohmic contacts on GaAs/Ga$_{1-x}$Al$_x$As concentrator solar cells based on palladium and gold deposition. C.Flores (Centro Informazioni Studi Esperienze SpA, Milan, Italy).
Sol. Cells (Switzerland), vol.9, no.3, p.169-77 (Aug. 1983).
A new fabrication process for high concentration GaAs/Ga$_{1-x}$Al$_x$As solar cells is described that does not require any vapour deposition of the ohmic contacts. The process is based on the electroless deposition of palladium as a p-type contact, while electrolytic gold is used as an n-type contact. Palladium exhibits good ohmic behaviour without any thermal alloying. From test patterns the specific resistance r_c of the ohmic contacts turns out to be 10^{-4} Ω cm^2 for palladium on p-type GaAs and 7×10^{-6} Ω cm^2 for gold on n-type GaAs. Several solar cells were fabricated and tested at 800 suns. The devices have series resistances lower than 10 mΩ cm^2 and thus are comparable with solar cells based on evaporated ohmic contacts. (9 refs.)

103698 X-ray photoelectron spectroscopy studies of copper diffusion behaviour and related degradation phenomena in thin film CdS:Cu$_2$S solar cells. A.C.Rastogi, S.Salkalachen (Div. of Specialized Techniques, Nat. Phys. Lab., New Delhi, India).
Sol. Cells (Switzerland), vol.9, no.3, p.185-202 (Aug. 1983).
Quantitative growth of thin Cu$_2$S layers in chemiplated thin film CdS:Cu$_2$S solar cells was observed by studying the depth profile concentrations of copper and sulphur by the X-ray photoelectron spectroscopy technique. Scanning electron microscopy examination of the junction revealed a complex and corrugated structure at the interface. From a study of the spatial distributions of cadmium, copper and sulphur and measurements of the saturated [Cd]/[S] ratios it is inferred that in deep layers the copper originates from grain boundaries. Similarly, by isolating the copper profile in the Cu$_2$S layers, the CdS grain-grain boundary region and the CdS grain boundaries and by applying suitable diffusion equations with appropriate boundary conditions, the diffusion coefficients in the midgrain and grain boundary regions were evaluated. In the chemiplating process copper diffusion is 5×10^2 times faster in the grain boundary than in midgrain. A short heat treatment of the cells causes the redistribution of cadmium and copper in the junction, making the interface sharper. Analysis yields diffusion coefficients of 5.8×10^{-11} $\exp(-0.229/kT)$ in midgrain and $1.06\ \exp(-0.964/kT)$ in the grain boundary. In order to gain knowledge of the degradation effects arising from copper migration, the evaluated diffusion coefficients were used to compute the time in which loss of Cu$_2$S stoichiometry and widening of the copper-compensated layer will lead to significant reduction in cell performance. This study shows that copper diffusion is not a severe life-limiting factor for CdS solar cells. (29 refs.)

103699 Stability of Pd/Nb$_2$O$_5$/amorphous hydrogenated silicon solar cells. V.Premachandran, S.Guha (Tata Inst. of Fundamental Res., Bombay, India).
Sol. Cells (Switzerland), vol.9, no.3, p.203-8 (Aug. 1983).
The stability of Pd/Nb$_2$O$_5$/amorphous hydrogenated silicon solar cells was investigated. Heat treatment in vacuum at 70°C was found to increase the saturation current density J_s and to reduce the open-circuit voltage V_{oc} to values close to those for palladium Schottky structures. Further deterioration in the characteristics takes place on exposure to H$_2$. The original values can be restored by exposing the diodes to O$_2$ or air. (12 refs.)

103700 On the effective minority carrier diffusion length of polycrystalline silicon solar cells. S.Kumari, S.K.Jain, B.K.Das, G.C.Jain (Div. of Materials, Nat. Phys. Lab., New Delhi, India).
Sol. Cells (Switzerland), vol.9, no.3, p.209-14 (Aug. 1983).
Polycrystalline substrates can be characterized in terms of an 'effective' minority carrier diffusion length L_e. Based on a generalized expression, L_e was computed for polycrystalline silicon solar cells in terms of the intragranular diffusion length L_0, the grain size d and the distance βL_0 up to which the grain boundary has an influence in accordance with a model suggested by Koliwad and Daud, who have demonstrated that $\beta=1$. These theoretical computations were compared with the experimental results of diffusion length measurements on solar cells fabricated from solar grade polycrystalline silicon. The value of β was found to vary randomly between 1.3 and 1.7 assuming uniform L_0 in all the grains. This is thought to be due to impurity-induced effects. Non-uniform grain boundary enrichment with impurities such as iron, chromium, nickel and copper was observed using scanning Auger microscopy and secondary ion mass spectroscopy techniques. (6 refs.)

103701 Degradation of the performance of Cu$_2$S/CdS solar cells due to a two-way solid state diffusion process. K.Moitra, S.Deb (Dept. of Electronics & Telecommunication Engng., Jadavpur Univ., Calcutta, India).
Sol. Cells (Switzerland), vol.9, no.3, p.215-28 (Aug. 1983).
A model of a mechanism of degradation in Cu$_2$S/CdS solar cells, arising out of the growth of a recombination layer in the skin region near the junction due to the two-way diffusion of copper and cadmium atoms, was proposed by Deb and Saha to explain the time variation in the performance of such cells using ceramic tablets. The analytical relations given by Deb and Saha were mainly guessed through intuitive reasoning. In the present paper an attempt is made to develop the model further and to give it an analytical basis through a solution of the relevant diffusion equation, subject to the assumption that the concentrations of excess copper and cadmium atoms at the skin region boundary and junction side boundary respectively of the recombination layer are constant and that the distributions of the diffusing species in the medium are linear. Apart from confirming the linear law for the normalized short-circuit current density versus the square root of time, the relation thus obtained leads to more reliable estimates of the rate constants mentioned earlier. The expressions derived are used to analyse the degradation in performance of vacuum-deposited thin film Cu$_2$S/CdS solar cells, as opposed to the ceramic cells studied earlier. (14 refs.)

103702 Photoelectrochemical solar cells: temperature control by cell design and its effects on the performance of cadmium chalcogenide-polysulphide systems. N.Muller, D.Cahen (Weizmann Inst. of Sci., Rehovot, Israel).
Sol. Cells (Switzerland), vol.9, no.3, p.229-45 (Aug. 1983).
The results of experiments probing the influence of various design parameters of photoelectrochemical cells on light-induced heating of such cells are presented. Both simulated (indoor) and outdoor experiments were performed. The use of a proper cell design allows a large degree of control over the operating temperature range of the cell. The temperature dependence of the photovoltaic performance of cells using CdSe and Cd(Se, Te) thin film polycrystalline photoelectrodes in aqueous polysulphide solution was found to depend on the individual photoelectrode. A general trend showing an optimal temperature range above room temperature can be discerned. Systems with higher conversion efficiencies tend to have a higher optimal temperature range than those with poorer efficiencies. This is attributed mainly to solution chemistry limitations. In addition the authors present data for similar cells that worked for periods between 3 and 15 months under mid-European climate conditions. While some variability was observed, several of the cells suffered not at all, or only slightly. The stability of the photoelectrodes under these conditions is ascribed mainly to the well-insulated cells used, which ensure operating temperatures under solar illumination up to 40°C above the ambient temperature. (27 refs.)

103703 Optimization of substrate thickness for interdigitated back contact silicon solar cells. P.Verlinden, F.van de Wiele (Lab. de Microelectronique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
Sol. Cells (Switzerland), vol.9, no.3, p.247-56 (Aug. 1983).
A simplified analytical model for interdigitated back contact solar cells is used in a computer program to calculate the optimum substrate thickness giving the maximum efficiency as a function of the measured diffusion length and surface recombination velocity. The program also calculates the maximum allowable thickness corresponding to a short-circuit current density reduction of 10%. Simple empirical formulae are presented allowing the rapid and highly accurate determination of the optimum value of the substrate thickness as a function of the above parameters. (9 refs.)

103704 Simple method for the determination of the minority carrier diffusion length in metal/insulator/semiconductor solar cells. S.Niedzwiedz, S.K.Krawczyk (Inst. of Electron Technol., Tech. Univ. of Warsaw, Warsaw, Poland).
Sol. Cells (Switzerland), vol.9, no.3, p.257-60 (Aug. 1983).
A simple method for the determination of the minority carrier diffusion length in metal/insulator/semiconductor (Schottky) solar cells is proposed. This parameter is calculated directly from the peak position of the solar cell spectral response, measured under constant-light-intensity conditions. Excellent sample-to-sample agreement within lots, as well as very good agreement with the results obtained by another technique, is apparent. Diagrams presented in this paper permit direct readout of the diffusion length in monocrystalline silicon. (8 refs.)

103705 Annealing and diffusion processes in thin film CdS/Cu$_2$S solar cells. F.J.Bryant, A.K.Hariri, S.Salkalachen, C.G.Scott (Dept. of Phys., Univ. of Hull, Hull, England).
Thin Solid Films (Switzerland), vol.105, no.4, p.343-51 (29 July 1983).
Diffusion of copper during post-fabrication annealing of CdS/Cu$_2$S thin film solar cells was studied by Auger electron spectroscopy. Depth profiles of the constituent element concentrations indicate that, for samples annealed in air, a deep penetration of copper into the cadmium sulphide layer occurs together with a significant out-diffusion of cadmium. In contrast, the copper penetra-

tion which results from vacuum or hydrogen annealing treatment is substantially less and no out-diffusion of cadmium is observed for annealing temperatures up to 400°C. (15 refs.)

103706 A consideration about the antireflective coating of silicon solar cells. N.Shibata (Faculty of Engng., Osaka Electro-Communication Univ., Neyagawa, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.430-1 (May 1983). In Japanese.
An antireflective layer is formed on a *P/N* silicon solar cells by processing hydrofluoric acid for about 10 minutes. After HF processing, the conversion-efficiencies of the cells are improved by about 30%. (3 refs.)

103707 Status and perspectives of MHD generators. L.H.Th.Rietjens (Dept. of Electrical Engng., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Phys. Bl. (Germany), vol.39, no.7, p.207-10 (July 1983). In German.
High efficiencies can be achieved in the conversion of heat into electrical energy by the introduction of a combined magnetohydrodynamic (MHD) steam cycle. The potential offered by MHD has been demonstrated by studies showing coal-to-busbar conversion efficiencies approaching 50% with an electricity cost lower than that of competitive systems. Low NO_x and SO_2 emission levels are obtained. The development program areas identified and recommendations for new developments given. (13 refs.)

86.30R Thermal energy conversion (heat engines and heat pumps)

103709 Heat pump basics. I: heat pumps in large commercial buildings. V.S.Manian (Cummins & Barnard Inc., Ann Arbor, MI, USA).
Energy Eng. (USA), vol.80, no.3, p.25-50 (1983).
Basic requirements for successful applications and an illustrative energy estimating procedure for heat pump systems are discussed. (16 refs.)

103710 Domestic heating systems and their selection. J.E.Randell (Dept. of Civil Engng., Univ. of Salford, Salford, England).
Build. Serv. Eng. Res. & Technol. (GB), vol.4, no.2, p.52-61 (1983).
Current trends in domestic heating practice are reviewed and the effects of higher standards of building insulation on heating system selection and performance are considered. Characteristics of the basic types of heating system are examined in the light of increased energy consciousness. Alternative design philosophies are identified and the practical implications of low energy buildings in the selection and design of heating systems are discussed. The arguments are illustrated by reference to experimental low energy houses constructed in Salford and the results of investigative experiments on the houses are considered from a practical viewpoint. (2 refs.)

103711 Present position and trends in the development of energy absorption systems. B.Dietrich, U.Jacobs (Rheinisch-Westfalischen Elektrizitatswerkes AG, Essen, Germany).
ETA Elektrowaerme Tech. Ausbau Ed. A (Germany), vol.41, no.4, p.A114-28 (July 1983). In German.
The principle of operation of heat pumps is reviewed and their advantages over solar heat is pointed out. The numerous sources of heat for a heat pump, such as solar heat, air, rain, soil etc. are discussed. The mathematical basis of energy absorption through heat exchanger surfaces is dealt with and a numerical example is given. For reliable and even operation under varying temperature conditions (summer/winter) a heat pump should be associated with a conventional fuel boiler. Regarding absorption surface requirements, a 150 m^2 surface area house would need appr. 50 m^2 roof absorption surface. Sketches of heat pump/conventional boiler systems as well as some of roof platten installations are given. The latest versions of roof heat absorbers consist of copper, aluminium or polythene pipes and are integral with the roof. (no refs.) *G.R.S.*

103712 Theoretical and experimental research into a compact energy absorber. W.Krumm, F.N.Fett, G.Wozny.
ETA Elektrowaerme Tech. Ausbau Ed. A (Germany), vol.41, no.4, p.A129-33 (July 1983). In German.
A heat pump absorber is exposed to the influence of a number of environmental elements, such as wind velocity, solar radiation, rain, air moisture precipitation etc. A mathematical model of a heat absorber taking all these factors into account is presented and tests on a heat pump of nominal capacity of 13.6 kW are described. The experimental results agreed closely with the theoretical predictions. It was shown that wind velocity and air moisture have the greatest effect on absorption efficiency. (5 refs.) *G.R.S.*

103713 Planning and construction of a heat pump plant with a vertical ground heat exchanger. L.T.van Agthoven, K.Wiskie.
ETA Elektrowaerme Tech. Ausbau Ed. A (Germany), vol.41, no.4, p.A133-7 (July 1983). In German.
An experimental heat pump installation is described for heating a house of 370 m^2 surface area and 1340 m^2 room volume. The heat requirement was 18 kW and the heat pump has 30 vertical heat exchangers buried in the ground. The house was heated by hot water in under floor pipes. Sketches show the type of heat exchanger elements employed and the general arrangement of the exchanger. A curves gives the average pipe temperature with relation to the particular time in the heating season. The heating system is schematically represented. (10 refs.) *G.R.S.*

86.30S Photothermal conversion

103714 Solar energy in industry. M.Blandin.
Equip. Ind. Achats & Entretien (France), vol.32, no.354, p.49-51, 53-4 (July-Aug. 1983). In French.
The energy density of solar irradiation of the Earth's atmosphere, its spectal distribution and the percentage attaining ground level are summarised (the mean annual insolation on a horizontal plane in France is quoted as 1.3 GWh/m^2). Photothermal convertors are discussed (after a passing reference to photovoltaic cells) under the headings of low-temperature plane liquid absorbers with and without glazing and with vacuum tubes, and high-temperature absorbers with spherical or parabolic concentrators. Energy storage capacities for diurnal, short-term and long-term retention (using sensible heat, sensible plus latent heat, and underground storage) are compared. Integration with buildings is described. Sizes and costs of installations for space heating and for production of domestic or industrial hot water are contrasted. Design points needing special attention include degassing, pressurisation to prevent boiling, and dimensioning of heat exchangers. (no refs.) *M.B.D.*

103715 Linear stability analysis of double-diffusive solar pond. M.S.Sodha, A.Kumar (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.67-71 (1983).
In this communication, the stability of the double-diffusive solar ponds has been investigated in the linear approximation. The corresponding linearised system of equations of motion is reduced to a single integro-differential equation using the Green-function technique. In contrast to the conclusions of Veronis that, initially, the instability occurs as an oscillatory mode and at a value of R_T (Rayleigh number for temperature) greater than R_S the motion becomes steady, the present analysis shows that, initially, as R_T increases from zero but remains considerably less than R_S, exponentially growing and decaying modes (steady motion) occur first; for a value of R_T more than a critical $R_T{}^c$, the motion becomes oscillatory. This oscillatory motion may, due to the basic non-linear dynamics of the system, even become aperiodic. Further, for $R_S \rightarrow \infty$, the minimum value of R_T for which steady motions can occur tends to $\mathcal{K}^{-1/2}.R_S$, where $\mathcal{K}=K_S/K_T$ where K_S and K_T are diffusivity coefficients for salt and temperature, respectively; as a contrast, according to Veronis, $R_T \rightarrow \sigma^{-1} R_S$; $\sigma=\nu/K_T$, ν being the kinematic viscosity. (8 refs.)

103716 Comparative study on performance of two models of solar device for melting wax during the winter season. P.B.L.Chaurasia, J.P.Gupta, B.V.Ramana Rao (Div. of Wind Power & Solar Energy Utilisation, Central Arid Zone Res. Inst., Jodhpur, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.73-5 (1983).
The paper describes the performance study of two similar solar devices of different capacities which melt paraffin wax to manufacture candles. These devices are based on a flat plate collector system having the same absorbing surface area (0.25 m^2) but different capacities of about 5.0 and 8.0 kg, respectively. It has been found that better results are obtained with the lesser capacity unit during the winter season at Jodhpur. (2 refs.)

103717 Transient analysis of forced circulation solar water heating system with collectors in series. S.N.Shukla, G.N.Tiwari (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.77-82 (1983).
This communication presents an analysis of the thermal performance of a hot water system consisting of *N* collectors in series with a storage tank; forced circulation and withdrawal of hot water by displacement with cold water are built into the thermal model. Two modes of withdrawal of hot water, viz. (i) constant flow rate and, (ii) constant hot water temperature (during the day), have been considered. For a quantitative appreciation of the results, numerical calculations have been made for the two modes of hot water withdrawal corresponding to a typical cold day (26 January, 1980) in Delhi. (9 refs.)

103718 Transient analysis of double basin solar still. V.S.V.Bapeshwararao, U.Singh, G.N.Tiwari (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.83-90 (1983).
The effect of water flowing over the upper glass cover of a double basin solar still on its transient performance has been presented. A comparative study of

the daily distillate production of a double basin solar still with and without water flowing over the upper glass cover has been made, and some interesting conclusions have been drawn. Numerical calculations have been made for a typical hot day (viz. 2 May 1980) in Delhi. (17 refs.)

103719 Year-round performance of an improved collector-cum-storage type solar water heater. N.M.Nahar (Solar Energy Section, Central Arid Zone Res. Inst., Jodhpur, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.91-5 (1983).
Systematic studies have been carried out on collector-cum-storage type solar water heaters, and efforts were made to minimise heat losses so that this type of water heater can be used for getting hot water at 40°-45°C for taking baths in the early morning hours of the next day. This paper reports year round performance, the performance equation and economics of this new improved solar water heater. This heater can supply 100 litres of hot water at 60°-70°C in the afternoon, and 40°-45°C temperature can be retained till next day morning. Its efficiency is 70.1%. (14 refs.)

103720 Theoretical study of tilted solar still as a regenerator for liquid desiccants. P.Gandhidasan (Dept. of Mech. Engng., Univ. of the West Indies, St. Augustine, Trinidad).
Energy Convers. & Manage. (GB), vol.23, no.2, p.97-101 (1983).
A closed type (tilted solar still) solar regenerator has been studied in application to regeneration with liquid desiccants. Essentially, it consists of a flat blackened, tilted surface with a transparent glazing as a covering. The absorbent solution which is to be regenerated trickles down as a thin film over the absorber and is heated by solar energy. The water vapor that evaporates from the liquid film is condensed on the underside of the glass cover and the solution leaving the regenerator becomes strong. A simple expression is derived, in this paper, to estimate the mass of water evaporated from the weak absorbent solution as a function of climatic conditions and initial conditions of the absorbent solution. A comparison is also made with a forced flow air circulation regenerator, and it was found that the closed type regenerator may be used for regeneration only in hot, humid climates. (11 refs.)

103721 Transient performance of normal/reverse flat plate collector with selective absorber surface. M.Madhusudan, G.N.Tiwari (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India), H.K.Sehgal.
Energy Convers. & Manage. (GB), vol.23, no.2, p.107-11 (1983).
The paper presents the performance of an optimised collector system [1], employing light heat transfer oil as working fluid, operated in normal and reverse configurations under simulated solar conditions. Expressions for transient and stagnation temperatures of the working fluid have been derived. Experimental and theoretical values of efficiencies for different incident intensities show good agreement. The results indicate that shallow (10 mm) liquid stream results in more efficient solar thermal performance for the normal and the reverse configurations. (6 refs.)

103722 Experimental and analytical performance study of a thermosyphon water heater. T.Muneer, M.M.Hawas, Y.Khalifa (Dept. of Mech. Engng., Garyounis Univ., Benghazi, Libya).
Energy Convers. & Manage. (GB), vol.23, no.2, p.119-24 (1983).
The performance of a thermosyphon solar water heater was studied analytically and experimentally. A finite-difference model was used to predict year-round performance. Tests were conducted on an experimental heater subjected to actual weather conditions in Benghazi, Libya. Satisfactory qualitative and quantitative agreement was found between experimental and predicted results. A storage volume of 60 litres per unit collector area was found to be optimum for Benghazi conditions. The day-end temperature was found to vary between 23° and 51°C for the test period, which occurred in winter, with an average of 41°C. (12 refs.)

103723 The total anodization of copper films on platinum: Use as selective surface absorbers at high temperature. A.A.Milgram (Weizmann Inst. of Sci., Rehovot, Israel).
J. Appl. Phys. (USA), vol.54, no.8, p.4692-3 (Aug. 1983).
A thin film of metallic copper deposited on an inert metallic conductor was totally anodized in a NaOH solution. The resulting anodic copper oxide film is shown to have excellent selective surface properties for use as a solar absorber at high temperatures. (5 refs.)

103724 Selective solar absorbers made from stainless steel: influence of the chemical composition and the metallurgical state of the alloy on the optical properties. L.Aries, J.P.Bonino, R.Benavente, J.P.Traverse (Lab. de Recherche sur l'Energie, Univ. Paul Sabatier, Toulouse, France).
Mater. Res. Bull. (USA), vol.18, no.7, p.781-95 (July 1983). In French.
Efficient photothermal converters exhibit high solar absorptance and low thermal emittance. An original method has allowed spectrally selective coatings to be obtained by chemical conversion of stainless steel. These coatings exhibit high selectivity (absorptance higher than 95% and emittance lower than 20%) and excellent durability. The dependence of the optical properties of these coatings on the chemical composition and metallurgical state of the substrate is studied. Low emittance appeared to be closely related to the corrosion resistance of the metallic surface in the treatment bath. Owing to this fact, convenient conditions can be found to produce selective coatings for each alloy. (20 refs.)

103725 A wind-mixed layer model for solar ponds. J.F.Atkinson, D.R.F.Harleman (MIT, Cambridge, MA, USA).
Sol. Energy (USA), vol.31, no.3, p.243-59 (1983).
A computer model is described which may be used for predicting transient salinity and temperature profiles in a salt gradient solar pond. It is intended for use in modeling larger surface area ponds where wind-mixing would be expected to play an important part in the dynamics of the upper layer. The formulation predicts the depth of the upper convecting zone using a mixed-layer model which incorporates the wind-mixing algorithm described by Bloss and Harleman. This is in contrast to earlier solar pond models which have generally assumed a constant value for this layer depth. Results have been obtained for a number of 1-yr simulations of a large hypothetical pond in Richmond, Virginia, and these have been used in testing the sensitivity of the model to several of the input parameters, including the radiation term and the form of the wind-mixing algorithm. The model output is also compared with field data from an operating solar pond and good agreement is found. Results have indicated that some measures will have to be taken to counteract the mixing action due to wind stress, if the upper mixed layer depth is to be maintained at an acceptable level. The model is expected to be useful in large-scale pond design. (39 refs.)

103726 Numerical optimization of a solar air heating system based on encapsulated PCM storage. P.-H.Theunissen, J.-M.Buchlin (von Karman Inst. for Fluid Dynamics, Rhode Saint Genese, Belgium).
Sol. Energy (USA), vol.31, no.3, p.271-7 (1983).
A Transient Solar Utility Network Simulation (TSUNS) code of a solar air heating system using rock bed energy storage (RBES) or phase change energy storage (PCES) is presented. Solar fraction obtained by TSUNS with RBES under Belgian climatic conditions are compared with Fchart results. The storage working times are compared between Belgium and US climates. Use of PCES in a solar air heating system provides an easy way to control overheating. Solar fraction of such systems can be improved by suitable adjustment of parameters such as phase change material (PCM) fusion temperature, latent heat and storage heat exchange properties. Comparisons between RBES and PCES ($CaCl_26H_2O$) are drawn in thermal and parasitical power field. (8 refs.)

103727 The thermal trap solar collector. J.P.Kenna (Solar Energy Unit, Univ. Coll. Cardiff, Cardiff, Wales).
Sol. Energy (USA), vol.31, no.3, p.335-8 (1983).
The purpose of this Technical Note is to show that although the thermal trap collector can theoretically perform better than a flat plate collector, in practice a 30 mm thick acrylic cover would be required to equal the performance of a typical single glazed flat plate collector with a selective absorber. The use of outer glazings allows improvements to be made for smaller trap thicknesses, for example 5 mm. The cost of thick acrylic sheets and the limitations which the use of acrylic sheet would place on the working temperature range of thermal trap collectors make it unlikely that designs based on acrylic thermal traps could be economically viable. New materials are required before this approach to collector design can be expected to succeed in the market place. (5 refs.)

103728 Spectrally selective black tungsten films. L.K.Thomas, E.E.Chain (Optically Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Thin Solid Films (Switzerland), vol.105, no.3, p.203-11 (22 July 1983).
Black tungsten thin films, combining significant solar absorptance with a high IR reflectance, were produced by the thermal decomposition of $W(CO)_6$ onto silicon substrates in the presence of an oxygen bleed. The effect of annealing treatments on the reflectance was investigated for annealing conducted in a reducing atmosphere at temperatures up to 1000°C. (30 refs.)

86.40 ENERGY STORAGE (SECONDARY ENERGY)

86.40F Storage in thermal energy

103729 Heat buffer storage pays, but not long term storage. F.Scholz (KFA Julich, Julich, Germany).
Energie (Germany), vol.35, no.5, p.133-7 (May 1983). In German.
District and regional heating network heat availability is briefly discussed. Short term buffer storage for frequent peak demands with water as storage medium to avoid need for heat exchangers is more economic than costly seasonal storage. Heat container features and costs are considered, where costs rise steeply with storage pressure. Aspects of the Hamburg heat supply networks with buffer storage capacity, the Flensburg heat supply undertaking with its large 28000 m^3 atmospheric pressure heat buffer store, and the Lower Rhine Dinslaken/Duisburg network with considerably fluctuating heat availability from a number of industrial sources, and buffer storage implications, are presented. (24 refs.) *H.V.H.*

103730 Sensible heat storage in water. B.Harmsworth.
Heat. & Vent. Eng. (GB), vol.57, no.659, p.5-10 (July-Aug. 1983).
Of all the possible media for the storage of sensible heat, water is the most obviously attractive. The paper describes work undertaken for the Energy Technology Support Unit to study the variation of the costs of heat storage in water with the method of store construction, store volume and insulation, seeking to identify the lowest cost option, and with the operating strategy, including the sensitive parameter of storage time. 86.40K Hydrogen storage and technology

103731 Hydrogen as the source of energy in internal combustion engines. K.Prescher.
OEIAZ Oesterr. Ing.- & Archit.-Z. (Austria), vol.128, no.6, p.226-32 (1983). In German.
Amongst the advantages of the use of hydrogen as fuel in internal combustion engines are those of availability and the absence of pollution problems. For the purposes of laboratory investigation an experimental single-cylinder air-cooled engine was used having a capacity of 1.6 l swept volume with a welded cylinder-head forming a combustion chamber of 58 mm diameter, and through a quartz glass window in which, and by a special optical arrangement, the conditions of ignition and combustion were recorded by a film camera. Views are given on the direction of future developments leading to diesel type engines and methods of fuel storage. (no refs.) *A.G.P.*

103732 Thermal efficiency of the magnesium-iodine cycle for thermochemical hydrogen production. Y.Shindo, N.Ito, K.Haraya, T.Hakuta, H.Yoshitome (Process Res. & Dev. Div., Nat. Chem. Lab. for Industry, Ibaraki, Japan).
Int. J. Hydrogen Energy (GB), vol.8, no.7, p.509-13 (1983).
The cycle consisting of the redox reaction of iodine with magnesium oxide, the thermal decomposition of magnesium iodate, the hydrolysis of magnesium iodide and the thermal decomposition process was calculated on material and

energy balances for three proposed flow-sheets varying according to the method used (quenching, selective absorption of HI by magnesium oxide and the two-step chemical decomposition of HI by magnetite) to separate the products of hydrogen iodide decomposition. Values of 19-37% for the MgO method and 16-35% for the Fe_3O_4 method. In order to obtain more than 25-30% of the thermal efficiency, heat recovery must be more than 80%. (18 refs.)

103733 Thermochemical hydrogen production based on magnetic fusion. O.H.Krikorian (Lawrence Livermore Nat. Lab., Livermore, CA, USA), L.C.Brown.
Int. J. Hydrogen Energy (GB), vol.8, no.7, p.515-28 (1983).
Conceptual design studies have been carried out on an integrated fusion/chemical plant system using a Tandem Mirror Reactor fusion energy source to drive the General Atomic Sulfur-Iodine Water-Splitting Cycle and produce hydrogen as a future feedstock for synthetic fuels. Blanket design studies for the Tandem Mirror Reactor show several alternatives available for providing heat at sufficiently high temperatures. The concept of a Joule-boosted decomposer is introduced in one of the systems investigated to provide heat electrically for the highest temperature step in the cycle (the SO_3 decomposition step), and thus lower blanket design requirements and costs. Flowsheeting and conceptual process designs have been developed for a complete fusion-driven hydrogen plant, and the information has been used to develop a plot plan for the plant and to estimate hydrogen production costs. (12 refs.)

103734 Design studies of the sulfur trioxide decomposition reactor for the Sulfur Cycle hydrogen production process. S.S.Lin, R.Flaherty (Advanced Energy Systems Div., Westinghouse Electric Corp., Pittsburgh, PA, USA).
Int. J. Hydrogen Energy (GB), vol.8, no.8, p.589-96 (1983).
The Sulfur Cycle is a two-step hybrid electrochemical/thermochemical process for decomposing water into hydrogen and oxygen. Integration of a complex chemical process with a solar heat source poses unique challenges with regard to process and equipment design. The conceptual design for a developmental test unit demonstrating the sulfur cycle was prepared in 1980. The test unit design is compatible with the power level of a large parabolic solar collector. One of the key components in the process is the sulfur trioxide decomposition reactor. The design studies of the sulfur trioxide decomposition reactor encompassing the thermodynamics, reaction kinetics, heat transfer and mechanical considerations, are described along with a brief description of the test unit. (4 refs.)

103735 Production of hydrogen by direct thermal decomposition of water. J.Lede, F.Lapicque, J.Villermaux (Lab. des Sci. du Genie Chimique, CNRS-ENSIC, Nancy, France).
Int. J. Hydrogen Energy (GB), vol.8, no.9, p.675-9 (1983).
This paper reports the first results of a study on the feasibility of producing hydrogen by direct thermal splitting of water by use of concentrated radiation. Relative amounts of H, O, OH, H_2, O_2 and H_2O have been computed between 1500 and 4000K at thermodynamic equilibrium. In addition, the rate of the overall reaction has been estimated assuming a kinetic model: 90% of equilibrium concentrations are reached after about 10^{-2}, 10^{-3} and 10^{-4} s at 2200, 2500 and 3000K respectively. The dissociation experiments have been carried out in an image furnace, simulating the future use of a solar furnace. Water is injected through a zirconia nozzle heated at the focus. The hot jet containing active species is then quenched by turbulent cold jets in order to minimize recombinations. Several shapes of zirconia nozzles and quenching devices have been tested in order to maximize the net production of hydrogen, which reaches 1. 7 $STPl.h^{-1}$ in continuous operation. Modelling of the hot nozzle allows the calculation of the gas temperature and shows that thermodynamic equilibrium conditions are reached under certain conditions. Parallel experiments show that cooling rates up to $10^6 K\ s^{-1}$ can be obtained by quenching. (23 refs.)

103736 How to optimize hydrogen plant designs. W.F.Van Weenen (Kinetics Technol. Internat. Corp., Monrovia, CA, USA), J.Tielrooy.
Int. J. Hydrogen Energy (GB), vol.8, no.9, p.689-700 (1983).
In a typical hydrogen plant of the type which will be discussed, methane or higher hydrocarbons are reformed with steam in a steam hydrocarbon reformer operating at a pressure of 250-400 psig, a temperature of 1500-1600°F, and with a ratio of steam to carbon in the feed of about 3.0. Following the reformer and cooling, there is a single stage of high temperature carbon monoxide shift conversion. Optionally, after further cooling, this may be followed by a second stage of carbon monoxide shift conversion operating at a lower temperature to obtain a more favourable equilibrium; this is called low temperature shift conversion. After cooling to ambient temperature, the separation of the condensate, the gas is passed through a Pressure Swing Adsorption (PSA) unit which removes all the impurities along with a small amount of hydrogen. The waste gas from the PSA unit containing all the impurities is used as fuel to the reformer. Heat is recovered from the reformer flue gas, reformer product, high temperature shift converter product and low temperature shift converter product. This paper discusses some of the process variables and design variables which must be considered in arriving at an optimized design. Seven different flow schemes are discussed in the. (no refs.)

103737 The $Mg_2Ni_{0.75}M_{0.25}$ alloys (M=3d element): their application to hydrogen storage. J.P.Darbaudery, B.Darriet, M.Pezat (Lab. de Chimie du Solide, Univ. de Bordeaux I, Talence, France).
Int. J. Hydrogen Energy (GB), vol.8, no.9, p.705-8 (1983).
The solid solutions of $Mg_2Ni_{1-x}M_x$ (when M=V, CR, Fe, Co, Cu and Zn) have a Mg_2Ni-type structure with a large homogeneity range. A comparative study of the action of hydrogen has been carried out on all alloys corresponding to an x=0.25 formulation. The absorption-desorption process of hydrogen is reversible and after dissociation of the hydride the starting material is regenerated except for copper which has not been examined. Hydriding leads for all other alloys to formation of quaternary hydrides. The thermal stability is very close to that of Mg_2NiH_4 stability: partial substitution of nickel by cobalt in Mg_2Ni leads at given temperature to a lower dehydriding rate. (7 refs.)

103738 Ecological effects with the use of combined heat and power systems. A.Schmidt, W.B.Kim.
Brennst.-Waerme-Kraft (BWK) (Germany), vol.35, no.6, p.294-7 (June 1983). In German.
Describes the effect of a combined heat and power system on the emissions of noxious matter, if this system is substituted for the usual low-temperature heating systems which are operated as individual furnaces. Taking Vienna as an example, the author calculates the emitted amounts of noxious matter (SO_2 and dust) and proves that the installation of combined heat and power stations would reduce the emissions of noxious matter considerably. The course of calculation is mentioned and charts and diagrams contain the results. (4 refs.)

103739 Henry's Law constants and the air-sea exchange of various low molecular weight halocarbon gases. R.J.Hunter-Smith, P.W.Balls, P.S.Liss (School of Environmental Sci., Univ. of East Anglia, Norwich, England).
Tellus Ser. B (Sweden), vol.35B, no.3, p.170-6 (July 1983).
The McAuliffe (1971) multiple equilibration technique has been used to measure the Henry's Law constants for a variety of low molecular weight halocarbon gases in distilled and sea waters at a number of temperatures. Halocarbon measurements made on a cruise from 48°N to 65°S in the Atlantic in late 1981 indicate a small but statistically significant difference in atmospheric concentrations of freon-11 between N and S hemispheres. Similar measurements for carbon tetrachloride show no significant inter-hemispheric gradient. (15 refs.)

103740 Health effects guidance for uranium in drinking water. C.R.Cothern, W.L.Lappenbusch, J.A.Cotruvo (US Environmental Protection Agency, Washington, DC, USA).
Health Phys. (GB), vol.44, suppl.1, p.377-84 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
The interim regulations for radioactivity in drinking water were promulgated in 1976 (Federal Register, Friday, 9 July, 1976, p.28402). These regulations specifically excluded uranium because of uncertainties concerning its toxicology, treatment technology and occurrence. At this time, EPA's Office of Drinking Water is considering proposing a health effects guidance level of 10 pCi/l. (0.37 Bq/l.) for uranium in drinking water. This paper describes the approach that EPAs Office of Drinking Water is considering in developing the guidance level. This value has not yet been officially determined to be EPA's formal guidance, but is presented as a working hypothesis for review and comments. Included here is a discussion of occurrence, pharmacokinetics and health effects. The calculation of doses uses the ICRP 30 model and the risk determination uses EPA's newly developed life table approach. The risk level from ingesting drinking water with a uranium content of 10 pCi/l. is estimated to be about 3×10^{-5} excess cancers/lifetime. (16 refs.)

103741 Occurrence of uranium in drinking water in the US. C.R.Cothern, W.L.Lappenbusch (US Environmental Protection Agency, Washington, DC, USA).
Health Phys. (GB), vol.45, no.1, p.89-99 (July 1983).
Uranium is found in ground and surface waters due to its natural occurrence. In some cases, its presence is due to human activities such as mining and milling uranium. Thus, it is also found in drinking water. The range of concentrations existing in drinking water supplies in the US is tabulated and examined. The range of isotopic abundances are also listed. Projections from the available data lead to estimates that of the 59812 community drinking water supplies in the US, 25-650 would exceed a uranium concentration of 20 pCi/l, 100-2000 would exceed 10 pCi/l and 2500-5000 would exceed 5 pCi/l. (29 refs.)

103742 Oil pollution on the Egyptian Red Sea coast. R.G.M.Hanna (Inst. of Oceanography & Fisheries, Cairo, Egypt).
Mar. Pollut. Bull. (GB), vol.14, no.7, p.268-71 (July 1983).
A simple weighing method using carbon tetrachloride as solvent was used to survey the dissolved hydrocarbon and tarball levels in the area of the Egyptian Red Sea coast. The area of investigation covers the coastal area from Ras-Gharib down to the port of Qosier during the period from September 1979 to February 1981. The survey confirms the presence of extensive oil pollution in the area, especially at Ras-Gharib and Ras-Shukhair. Minimum concentrations were obtained at Ghardaqa where no dissolved hydrocarbons were detected in 1979-80 but an increase to 20 $\mu g\ l^{-1}$ in 1981 was recorded. The high levels of pollution recorded in the southern part of the Gulf of Suez are related to the presence of the offshore oil fields, most of which are located at Ras-Gharib. (8 refs.)

103743 Simulation of water exchange and pollutant dispersal in the Gulf of Neva. L.A.Rukhovets (Inst. of Social Economic Problems, Acad. of Sci., USSR).
Sov. Meteorol. & Hydrol. (USA), no.7, p.61-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.7, p.78-87 (1982).
A numerical solution to simplified shallow water equations provides a picture of the stationary currents in the Gulf of Neva under natural and dammed conditions. A theoretical solution has been constructed for the two-dimensional equation for turbulent diffusion of persistent pollutants coming from purification plants. An estimate is made of the possible effects of a proposed dam on the pollutant distribution. (11 refs.)

103744 The computation and reporting of dissolved gas levels. J.E.Colt (Dept. of Civil Engng., Univ. of California, Davis, CA, USA).
Water Res. (GB), vol.17, no.8, p.841-9 (1983).
Provisional standards are proposed for the computation and reporting of dissolved gas levels in freshwater and seawater. Total gas pressure should be reported in terms of excess pressure (ΔP), while component gases such as nitrogen, argon, oxygen and water vapor should be reported in terms of partial or excess pressure. Barometric pressure, dissolved oxygen, water temperature and salinity must also be reported. (33 refs.)

103745 MICRO-RSMM: a microcomputer-based network simulation language for modeling pollutants in river systems. N.B.Rao (Dept. of Information Systems & Decision Sci., California State Univ., Fresno, CA, USA).
Modeling and Simulation on Microcomputers: 1983, San Diego, CA, USA, 1983 (La Jolla, CA, USA: SCS 1983), p.112-16
The prediction of steady state profiles of environmental pollutants in rivers is an important aspect of water quality modeling. The River Sysstem Modeling Methodology (RSMM) provides a framework for conceptualizing and constructing simulation models for analyzing pollution in rivers. In RSMM, a river system is represented by a set of nodes and branches which form a network diagram. Nodes represent river elements such as junctions and pollutant sources; branches represent homogeneous segments, reaches. The RSMM processor has been implemented as a FORTRAN program on larger machines. Another implementation of RSMM, called micro-RSMM has now been developed for the Apple-II microcomputer. In micro-RSMM, the user describes a river system through a set of statements which are interpreted by the micro-RSMM processor, which is written in Applesoft BASIC. Based on the user described system, micro-RSMM generates spatial profiles of various pollutants on the river. These outputs can be viewed either in the form of a table, or in the form of a plot which uses Apple's High Resolution Graphics. (9 refs.)

103746 Air quality network design for Saudi Arabia using long-range transport model. T.Husain, S.M.Khan (Res. Inst., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Atmos. Environ. (GB), vol.17, no.5, p.921-6 (1983).
The need for air quality surveillance is growing during the third five-year plan in Saudi Arabia. The main emphasis in the initial stage of this plan is to select the sites of air monitoring stations on the basis of scientific principles. To carry out this study, emission inventories of major point sources are compiled. Meteorological data for synoptic and upper air stations within the Kingdom of Saudi Arabia on wind speed, wind direction, temperature and pressure are collected and processed. Air Resources Laboratories (ARL) model is used to calculate long range trajectories of air parcels and to estimate concentration levels at various grid points within the region. Concentration contour maps are then prepared to identify adversely affected zones and potential air monitoring sites. (20 refs.)

103747 Analysis of the error associated with grid representation of point sources. P.Karamchandani, L.K.Peters (Dept. of Chem. Engng., Univ. of Kentucky, Lexington, KY, USA).
Atmos. Environ. (GB), vol.17, no.5, p.927-33 (1983).
The steady-state, three-dimensional transport equation for inert pollutant dispersion in the atmosphere is solved analytically to obtain expressions for pollutant concentrations from both a point source and a rectangular area source. The results of this analysis have application to numerical grid models in which the smallest resolvable source is the size of a single grid. (13 refs.)

103748 Intermediate-range grid model for atmospheric sulfur dioxide and sulfate concentrations and depositions. K.W.Ragland, K.E.Wilkening (Dept. of Mech. Engng., Univ. of Wisconsin-Madison, Madison, WI, USA).
Atmos. Environ. (GB), vol.17, no.5, p.935-47 (1983).
A three-dimensional time-dependent grid type model for two chemically reacting species which undergo atmospheric transport, diffusion and wet and dry deposition over a region of several hundred km is presented. Accuracy and sensitivity of the model are discussed. The model is applied to the Rainy Lake Watershed using the available emissions and meteorological data. The model calculations are compared to National Atmospheric Deposition Program wet deposition data and snow core data. (6 refs.)

103749 Mathematical modeling of the formation and transport of ammonium nitrate aerosol. A.G.Russell, G.J.McRae, G.R.Cass (California Inst. of Technol., Pasadena, CA, USA).
Atmos. Environ. (GB), vol.17, no.5, p.949-64 (1983).
A mathematical model describing the transport and formation of aerosol NH_4NO_3 is presented. Based on a vertically resolved Lagrangian trajectory formulation incorporating gas phase kinetics, NH_4NO_3 concentrations are computed at thermodynamic equilibrium with precursor HNO_3 vapor and NH_3 concentrations. A brief description of the NH_3 emissions inventory used in this study is included to indicate the important sources. The model was tested by comparison to ambient NH_3, NH_4^+ and NO_3^- concentrations measured at El Monte, California during June 1974. Potential applications model to control strategy decisions and to study the fate of NO_x are discussed. (63 refs.)

103750 Solution of the advection-diffusion equation by the moments method. R.Lupini (Istituto di Fisica, Univ. di Bologna, Bologna, Italy), T.Tirabassi.
Atmos. Environ. (GB), vol.17, no.5, p.965-71 (1983).
A general technique for solving the *K*-equation is developed on the basis of the truncated Gram-Charlier expansion of the concentration field, and of the finite set of equations for the corresponding moments. Such a 'moments method' can be applied to diffusion problems involving point sources and horizontally homogeneous boundary layer structures. It is suggested that this method may be more practical to use than the conventional grid model, particularly for routine applications. The fourth-order moments method is applied to a case of continuous plumes in a sheared atmosphere and the predicted concentration patterns are compared with the solutions obtained by a conventional grid model. (12 refs.)

103751 Trace gas profiles to 3000 m over Antarctica. E.Robinson, D.R.Cronn, F.Menzia, D.Clark, R.Legg, R.Watkins (Air Pollution Res. Section, Washington State Univ., Pullman, WA, USA).
Atmos. Environ. (GB), vol.17, no.5, p.973-81 (1983).
During October-December, 1980 air samples were collected on 13 helicopter flights between 30 and 3000 m above the Ross Ice Shelf, Antarctica were analyzed in McMurdo for N_2O and the halocarbons, F-11, F-12, CCl_4 and CH_3CCl_3 using electron capture gas chromatography. Average profiles differed when flights were classified on the basis of low-level inversion conditions, the magnitude of the temperature lapse rate, or the direction of upper level winds. These differences in trace chemical profiles above 200 m are postulated to result from a combination of mid latitude air mass advection and subsequent dilution over Antarctica with stratospheric air. Lower boundary layer gradients may indicate a surface source from an unknown physical enrichment process. (22 refs.)

103752 Prediction of cloud effects in chimney plumes. K.T.Spillane, C.C.Elsum (CSIRO Div. of Atmospheric Phys., Mordialloc, Victoria, Australia).
Atmos. Environ. (GB), vol.17, no.5, p.983-90 (1983).
A numerical model to predict the occurrence of visible condensation and cloud length in chimney plumes is tested against observations of the plume from a 500 MW natural gas-fired power station at Melbourne, Australia. The model employs two entrainment parameters selected from the literature on plume trajectories and not fitted to the observations reported. A criterion for a plume to be visible is developed for droplets around 5 μm radius and plume distribution of condensed water determined from Gaussian two-dimensionalization of temperature and total water. (27 refs.)

103753 Processing the turbulent diffusion problem in the atmospheric boundary layer by use of stochastic differential equations. Ye Wenhu, Lu Chongfei, Zhang Aichen (Peking Univ., Peking, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.69-78 (Feb. 1983). In Chinese.
On the basis of physical mechanics of turbulent diffusion, the turbulent diffusion process is described with Ito's stochastic differential equation, and the concentration model of the continuous point source is obtained. Its first order approximate solution is expressed as a form of analytical function. The special cases of the first order approximate solution are identified with the form which is commonly used. (15 refs.)

103754 Increase and seasonal cycles of nitrous oxide in the Earth's atmosphere. M.A.K.Khalil, R.A.Rasmussen (Dept. of Environmental Sci., Oregon Graduate Center, Beaverton, OR, USA).
Tellus Ser. B (Sweden), vol.35B, no.3, p.161-9 (July 1983).
Based on about nine thousand ground-level measurements at Cape Meares, Oregon (45°N), and Cape Grim, Tasmania (42°S), spanning three years, it is shown that nitrous oxide (N_2O) is increasing at about 0.9 p.p.b. yr^{-1} in the northern hemisphere, and at 0.7 p.p.b. yr^{-1} in the southern hemisphere. It is also shown that N_2O concentrations vary with the season. (29 refs.)

103755 Strong and weak acidity of aerosols collected over the Northeastern United States. R.J.Ferek (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA), A.L.Lazrus, P.L.Haagenson, J.W.Winchester.
Environ. Sci. & Technol. (USA), vol.17, no.6, p.315-24 (June 1983).
Total sulfate, acidity, and principal cations were measured in aerosol samples collected from an aircraft over the northeastern United States and at ground level on filters protected by a denuder tube for NH_3. Aerosol acidity was determined by aqueous extraction of the filters and titration with NaOH. Strong and weak acid components were resolved by using Gran plots. (43 refs.)

103756 Tracing bomb ^{14}C in the atmosphere 1962-1980. R.Nydal, K.Lovseth (Radiological Dating Lab., Norwegian Inst. of Technol., Trondheim, Norway).
J. Geophys. Res. (USA), vol.88, no.C6, p.3621-42 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
When the ever greater series of nuclear tests were exposed to the atmosphere at higher northern latitudes during 1961 and 1962, an attempt was made at this laboratory to trace the distribution of bomb-produced ^{14}C down to lower latitudes and into the ocean surface. Several ground level stations were established for this purpose in the early 1960s, from Spitsbergen to Madagascar. Measurements were also gradually extended to the ocean surface. The tropospheric measurements which partly have been performed during the past 18 years have proved to be important for testing exchange models for industrial CO_2 in the atmosphere and more generally for studying the carbon cycle in nature. The present paper includes tables of all the atmospheric ^{14}C data measured at the laboratory during 18 years. (23 refs.)

103757 Uranium and plutonium isotopes in the atmosphere. Y.Sakuragi, J.L.Meason, P.K.Kuroda (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3718-24 (20 April 1983).
Uranium 234 and 235 were found to be highly enriched relative to uranium 238 in several rain samples collected at Fayetteville, Arkansas, during the months of April and May 1980. The anomalous uranium appears to have originated from the Soviet satellite Cosmos-954, which fell over Canada on January 24, 1978. The uranium fallout occurred just about the time Mount St. Helens erupted on May 18, 1980. The concentration of ^{238}U in rain increased markedly after the eruption of Mount St. Helens, and it appeared as if a large quantity of natural uranium was injected into the atmosphere by the volcanic eruption. The pattern of variation of the concentrations of uranium in rain after the eruption of Mount St. Helens was found to be similar to that of plutonium isotopes. (13 refs.)

103758 Soot carbon and excess fine potassium: long-range transport of combustion-derived aerosols. M.O.Andreae (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
Science (USA), vol.220, no.4602, p.1148-51 (10 June 1983).
During a cruise from Hamburg to Montevideo, aerosol samples representing air masses from Europe, the Sahara, tropical Africa, South America, and open oceanic regions were collected. They showed significant amounts of soot carbon over large areas of the remote Atlantic, often similar to concentrations in rural continental areas. Back-tracjectories and the ratios of soot carbon to total fine carbon and of excess fine potassium to soot carbon indicate that biomass burning in tropical regions is an important source of soot carbon to the world atmosphere. (31 refs.)

103759 Release of man-made krypton 85 to the atmosphere. Yu.A.Izrael', I.M.Nazarov, A.G.Ryaboshapko (Inst. of Appl. Geophys., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.1-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.5-15 (1982).
It is shown that the main adverse consequence of krypton 85 release in an increase in the electrical conductivity of the atmosphere. Undesirable changes in the conductivity will occur when the atmosphere accumulates about 1.2×10^4 MCi of krypton 85, which corresponds to an input of 7.8×10^2

MCi/y. This is only six times the annual input that may be attained by the year 2000. (20 refs.)

103760 The dispersion of pollution particle coordinates in the ground layer of the atmosphere. E.K.Garger (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.26-33 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.6, p.35-44 (1982).
Results are presented on the absolute and relative coordinates of particles in the ground-level layer of the atmosphere obtained by means of balloons. The data are compared with the hypothesis of similarity in the Lagrange characteristics of the turbulence in that layer for neutral or unstable stratification. The coefficients in the similarity formulas are estimated for the relative and absolute dispersions, and these are compared with other experimental and theoretical estimates. (16 refs.)

103761 Propagation of a heavy pollutant in the boundary layer of the atmosphere with nonstationary penetrating convection. P.Yu.Pushistov, V.M.Mal'bakhov, S.M.Kononenko (West Siberian Regional Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.34-40 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.6, p.45-53 (1982).
A two-dimensional numerical hydrodynamic model for penetrating convection is used to examine the propagation of a heavy pollutant in the boundary layer. The source of the pollutant is a dust-covered surface. The spatial and temporal changes in the pollutant concentration are examined in relation to convection. Transport by convection and diffusion is examined, and also the effects of gravitational deposition. The numerical solution to the equations for the pollutant concentration are compared with the analytical solution obtained for conditions without convection. (15 refs.)

103762 Background observations on the chemical composition of atmospheric fallout at Mirnyi observatory. S.A.Mel'nikov, V.P.Rusanov (Arctic & Antarctic Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.41-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.9, p.56-61 (1982).
Chemical compositions are reported for atmospheric fallout and samples from surface snow cover and continental ice measured during the Twenty-Fourth Soviet Antarctic Expedition. The data can be used to follow the seasonal course of the composition of precipitation in the region of Mirnyi observatory. (8 refs.)

103763 Use of the method of isotope glaciology for studying nuclear explosion products in Antarctica. E.N.Davydov, K.P.Makhon'ko (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.36-42 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.5, p.48-55 (1982).
Data on the content of radioactive nuclear explosion products in annual ice layers at the Mirnyi, Molodezhnaya, Bellinshausen, and Vostok stations in Antarctica are used for calculating atmospheric fallout P and concentration in the air q of these products in preceding years when direct measurements of P and q were not carried out. The transformation of the aerosol contaminant during its transport from the Northern Hemisphere to the Antarctic coast is discussed. The time of transport of air masses from the Northern Hemisphere to the Southern in the troposphere and stratosphere, half time of the contaminant in the stratosphere in the southern polar region, and its effective settling rate are determined. (17 refs.)

103764 Electric potential gradient under conditions of industrial air pollution. A.A.Krechetov, A.Kh.Filippov, V.K.Tatarnikov (Irkutsk State Univ., Irkutsk, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.92-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.5, p.108-11 (1982).
The results of measuring the potential gradient under conditions of industrial air pollution are analyzed. The characteristics of the diurnal variation of the potential gradient at various distances from the pollution source are examined. The spatial correlation of the mean hourly values of the potential gradient is investigated. (5 refs.)

103765 Atmospheric diffusion experiments performed in October 1980 at the Turbigo ENEL power plant. P.Bacci, G.Carboni, M.De Bortoli, P.Gaglione, P.Thomas, S.Vogt.
Report EUR 8334 EN, Comm. European Communities, Luxembourg (1983), 30 pp.
Describes tracer atmospheric dispersion experiments carried out during October 1980 at the ENEL power plant of Turbigo (Po Valley, Northern Italy). The tracer was released from one of the plant stacks and near-ground concentrations were determined on air samples collected by automatic samplers at downwind source distances up to about 10 km. Several meteorological observations were performed simultaneously. The data obtained were evaluated by a least squares fit to deduce dispersion parameters. A reconstruction on the x-y plane of the plume is also computed. (8 refs.)

103766 Determination of arsenic and phosphorus compounds in groundwater with reduced molybdenum blue. R.E.Stauffer (Water Chem. Lab., Univ. of Wisconsin, Madison, WI, USA).
Anal. Chem. (USA), vol.55, no.8, p.1205-10 (July 1983).
Chemical studies were made to optimize reduced molybdenum blue for arsenic and phosphorus determinations in chemically diverse groundwaters. Phosphate strongly catalyzes the development of the arsenic(V) molybdate complex; increasing H^+ or H^+:Mo retards complexation, but the effect is greater for the potentially interfering silicomolybdate complex. The oxidation of As(III) to As(V) by iodate partially inhibits the subsequent color development of silica. Iodide has no effect. Fluoride ion partially suppresses silica color development, probably because of competitive Si-F complexing at low pH. The molybdate responses of As(V), P, and SiO_2 mixtures are not color additive. Optimum reaction conditions are $H^+=0.30$ N; H^+:Mo$=88$ for arsenic and phosphorus determinations in the presence of silica. (30 refs.)

103767 Preconcentration of trace elements in natural water with cellulose piperazinedithiocarboxylate and determination by neutron activation analysis. S.Imai, M.Muroi, A.Hamaguchi (Public Health Res. Inst., Kobe, Japan), M.Koyama.
Anal. Chem. (USA), vol.55, no.8, p.1215-19 (July 1983).
To prepare cellulose piperazinedithiocarboxylate (PID), tosylcellulose was reacted with piperazine to give the amino-cellulose which was then reacted with carbon disulfide. The preconcentration of the trace elements was accomplished by the PID column operations. Ten liters of river water or spring water sample was passed through the column at a given pH. The packings were taken out of the column, dried at 110°C, and then burned to ashes in a low-temperature plasma asher. The ashes were encapsulated in polyethylene rabbits of the pneumatic tube system and subjected to neutron irradiation in a reactor. γ-ray spectrometry was then performed on the irradiated sample and the concentration of 18 elements in natural water samples was determined. (4 refs.)

103768 Determination of hexachloroacetone in air. E.Kissa (Chem. & Pigments Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).
Anal. Chem. (USA), vol.55, no.8, p.1222-5 (July 1983).
Hexachloroacetone in air is collected in anhydrous methanol which reacts rapidly and quantitatively with hexachloroacetone. The reaction products, methyl trichloroacetate and chloroform, are determined by gas chromatography using an electron capture detector. The method can detect as little as 0.003 mg/m^3 hexachloroacetone in air. Moisture in air hydrolyzes hexachloroacetone to trichloroacetic acid and chloroform. The extent of hydrolysis can be calculated from the amounts of chloroform and methyl trichloroacetate found in methanol, if chloroform in air originates only from hydrolysis of hexachloroacetone. Unlike primary alcohols, secondary or tertiary alcohols do not reach with hexachloroacetone. (6 refs.)

103769 Time-resolved laser-induced breakdown spectrometry of aerosols. L.J.Radziemski, T.R.Loree, D.A.Cremers, N.M.Hoffman (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Anal. Chem. (USA), vol.55, no.8, p.1246-52 (July 1983).
The repetitive breakdown spark from a focused laser beam was used to generate analytically useful emission spectra of aerosols in air. The apparatus is simple; a pulsed laser and optics, a spectrometer, and some method for time resolution of the spark light. High temperatures in the spark result in vaporization of small particles, dissociation of molecules, and excitation of atomic and ionic spectra. The plasma acts as if it were in local thermodynamic equilibrium at least after 1 μs. Spectroscopic methods have been used to measure the time-resolved temperatures and electron densities. A simple one-dimensional hydrodynamic model predicts the temperature and diameter of the spark. Beryllium in atmospheric pressure air has been detected at 0.7 μg/m^3, which is 0.6 ng/g of air (RSD=30%). Limits of detection have also been established for Na, P, As, and Hg in air. (36 refs.)

103770 Eye-safe tracking of oil fog plumes by UV lidar. W.L.Eberhard (Wave Propagation Lab., NOAA, Boulder, CO, USA).
Appl. Opt. (USA), vol.22, no.15, p.2282-5 (1 Aug. 1983).
NOAA's Wave Propagation Laboratory operated a plume-tracking lidar during two field experiments investigating atmospheric dispersion in complex terrain. The lidar successfully acquired data on oil fog plume behavior by detecting the elastic backscatter of the pulsed output of a frequency-doubled ruby laser. This UV wavelength (0.3472 μm) met stringent eye safety restrictions. An analysis of signal and noise levels demonstrates that plume definition at a wavelength of 0.3472 μm is superior in many cases to that at 0.6943 μm when pulse energies are low enough to be eye-safe at the range to the plume. This is often true in spite of the high threshold set by the large molecular scatter from the ambient air at the UV wavelength. Backscatter coefficients of oil fog at the shorter wavelength were 1-4× larger than at the longer wavelength. (7 refs.)

103771 Determination of ethylene and other reactive hydrocarbons in the atmospheric air at Trombay, Bombay by gas chromatography using a chemiluminescent detector. A.M.Mohan Rao, A.J.Netravalkar, P.K.Arora, K.G.Vohra (Div. of Radiological Protection, Bhabha Atomic Res. Centre, Bombay, India).
Atmos. Environ. (GB), vol.17, no.6, p.1093-7 (1983).
A gas chromatographic method is described for the determination of reactive hydrocarbons in the atmospheric air at Trombay, Bombay. Pre-concentration of the atmospheric hydrocarbons is carried out on short U-columns of silica gel kept at dry-ice temperature. The detector is based on the measurement of light intensity due to chemiluminescent reactions between O_3 and the reactive hydrocarbons in the detector and is thus selectively sensitive to reactive hydrocarbons. Data on atmospheric concentrations of these hydrocarbons at Trombay is reported. (11 refs.)

103772 Radon concentration and exhalation measurement with a semiconductor detector and an electrostatic precipitator working in a closed circulation system. M.Wojcik, L.Morawska (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.393-402 (1 July 1983).
An apparatus is described and a method presented for the determination of concentrations of radon emanated from solid and liquid samples. In this method an object under consideration or a sample of air is enclosed in an hermitically sealed chamber. The air contaminated by radon and its daughters is circulated in a closed system a few times through an electrostatic precipitator mounted in the same housing as a semiconductor Si(Li) detector. The concentration of radon is determined by measuring the alpha activity of its daughters. With the application of an electrostatic precipitator and a silicon detector it is possible to perform alpha spectrometric measurements and thus separate activities of RaA, RaC′, and ThC, and to calculate ^{222}Rn of ^{220}Rn concentrations. The sensitivity of the apparatus is high. The minimum detectable radon concentration calculated from an activity measurement of RaA (fast method), is about 0.46 pCi/1 and when measuring the activity of RaC′ (slow method), it is 0.028 pCi/1. (10 refs.)

103773 The measurement of fluorine concentration in environmental samples by using $^{19}F(p,\alpha\gamma)^{16}O$ prompt nuclear reaction analysis. Shen Guantao, Liang Daihua, Li Deyi (Shanghai Inst. of Nuclear Res., Acad. Sinica, Shanghai, China), Zhou Muyao, Zhang Yongfa, Chen Yitai, Wang Chuanshan, Zhou Shuxin, Zhang Shengjun.
Nucl. Tech. (China), no.2, p.34-5, 33 (April 1983). In Chinese.
The paper gives a brief account about the principle of the method, sample treatment and apparatus in the measurement of the fluorine concentration of the environmental pollution by using the prompt nuclear reaction, $^{19}F(p,\alpha\gamma)^{16}O$. Results for two groups of soil samples are given, which to a certain degree reflect the fluorine pollution around the steel works. (3 refs.)

103774 In-flight radiometric calibration of advanced remote sensing systems. C.J.Kastner, P.N.Slater (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.158-65 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Several methods for the in-flight calibration of advanced remote sensing systems are reviewed. Pre-flight and in-flight detector-based calibration are discussed. Calibration by reference to instrumented ground targets is suggested for current systems. Preliminary data are presented on the accuracy and sensitivity required of measurements of ground targets and the atmosphere between the targets and the sensor to achieve an uncertainty in absolute terms of less than ±3% in the calibration of Landsat-4 systems. (31 refs.)

103775 Statistical characteristics of millimeter waves reflected from vegetation. G.A.Andreyev, A.A.Potapov, G.I.Khokhlov.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.6-11 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1863-9 (Oct. 1982).
Time-domain and spectral characteristics of millimeter waves reflected from vegetation are investigated experimentally and theoretically. The experiment is conducted at short millimeter wavelengths. The transmit-receive equipment had an energy potential of 140 dB and a circular polarization of radiation. A phenomenological description of correlation coefficient and spectra of such waves is proposed and verified experimentally. Formulas are derived which relate the spectral width of reflected millimeter waves to the average wind velocity. Average effect scattering areas of foliage and coniferous forests in the rain are determined experimentally. (12 refs.)

103776 Study of the binding of Mg ions by α-lactalbumin using fluorescent spectroscopy. Ye.A.Permyakov, L.P.Kalinichenko, L.A.Morozova, V.V.Yarmolenko, E.A.Burshtein (Inst. of Biological Phys., Acad. of Sci., Puschino, USSR).
Biophysics (GB), vol.27, no.4, p.597-602 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.578-83 (1982).
Titration with Mg^{2+} ions against bovine lactalbumin first freed of metal ions gives a two-step fall in the quantum yield of its tryptophan fluorescence and heavy shift of the fluorescence spectrum to the shortwave region. These changes appear to reflect conformational changes induced in the protein molecule by binding of two Mg^{2+} ions as a result of which the tryptophan residues localized in the metal-free form on the surface of the globule pass within the molecule into rigid nonpolar surroundings. The binding constants of Mg^{2+} evaluated from the curve of fluorometric titration of protein against magnesium are 2×10^3 and 2×10^2 M^{-1}. Mg^{2+} ions in millimolar concentrations barely influence the binding of Ca^{2+} ions by protein. Apha-lactalbumin in the state with one bound Ca^{2+}, one bound Mg^{2+}, two bound Mg^{2+} and without metals possess different fluorescence properties, which indicates a difference in the conformations of the protein in these states. It is postulated that Ca^{2+} and Mg^{2+} ions are bound by different centres of α-lactalbumin. The binding of Ca^{2+} and Mg^{2+} ions by α-lactalbumin must significantly modulate its function. (15 refs.)

103777 Interaction of collagen with sodium ions. Yu.P.Meshalkin, S.P.Gabuda, V.N.Shcherbakov, R.I.Aizman (Novisibirsk State Medical Inst., Acad. of Sci., Novisibirsk, USSR).
Biophysics (GB), vol.27, no.4, p.608-13 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.590-4 (1982).
Change in the ratio of the donor and acceptor adsorption centers on the surface of collagen is found on treatment with NaCl solutions. From the constant α of the spin-spin interaction of native collagen (0.15 ± 0.01) Oe and collagen treated with 3 per cent NaCl solution (0.115 ± 0.01) Oe the authors evaluate the number of binding centres at ~12.5 centres per 100 amino acid residues. Fall in the freezing point of water in the channels of the structure is found to have an unspecified effect on entry into them of Na^+ and K^+ ions in concentrations of over 3 per cent. (8 refs.)

103778 Fast diffusion along defects and corrugations in phospholipid $P_{\beta'}$ liquid crystals. M.B.Schneider, W.K.Chan, W.W.Webb (Dept. of Phys., Cornell Univ., Ithaca, NY, USA).
Biophys. J. (USA), vol.43, no.2, p.157-65 (Aug. 1983).
The diffusion of a fluorescent lipid analogue in liquid crystals of the anisotropic $P_{\beta'}$ phase of dimyristolyphosphatidylcholine had been found to be highly variable, suggesting structural defect pathways. Fluorescence photobleaching recovery (FPR) experiments imply two effective diffusion pathways with coefficients differing by at least 100. This is consistent with fast diffusion along submicroscopic bands of disordered material ('defects') in the bilayer corrugations characteristic of this phase. Due to strains during transformation from the L_α phase, the axis of the corrugations is ordinarily disrupted by mosaic patches rotationally disoriented with the mean plane of the molecular bilayers, although larger oriented domains are sometimes adventitiously aligned into microscopically visible striped textures. The corrugations are also systematically aligned along positive disclinations pairs or 'oily streaks'. Thus, fast diffusion occurs parallel to the disclination lines and along the textured stripes. FPR results yield an upper limit on the effective diffusion coefficient in the ordered material of $D\leq2\times10^{-16}$ cm^2/s at 22°C, $D\leq3\times10^{-17}$ cm^2/s at 13°C. In contrast the diffusion coefficient along defect pathways where disordered ribbons are aligned is $D\sim4\times10^{-11}$ cm^2/s at 16°C. (59 refs.)

103779 Pair distribution functions of bacteriorhodopsin and rhodopsin in model bilayers. L.T.Pearson, S.I.Chan (A.A. Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA), B.A.Lewis, D.M.Engelman.
Biophys. J. (USA), vol.43, no.2, p.167-74 (Aug. 1983).
The pair distribution functions have been measured from freeze-fracture pictures of bacteriorhodopsin and rhodopsin recombinants with diacyl phosphatidylcholines (PC) of various hydrocarbon chain lengths. Pictures were used of samples that had been frozen from above the phase transition temperature of the lipid. Measured functions were compared with those calculated from two model interparticle potential energy functions, (*a*) a hard-disk repulsion only, and (b) a hard-disk repulsion pulse electrostatic repulsion for a point charge buried in the membrane. The measured functions for bacteriorhodopsin di 12:0 PC, di 14:0 PC, and di 16:0 PC recombinants can be simulated using an interparticle hard-disk repulsion only. Bleached rhodopsin di 12:0 PC and di 18:1 trans-PC recombinants, and dark-adapted rhodopsin di 10:0 PC recombinants yield functions that are better simulated by assuming an additional repulsive interaction. The measured functions resemble those calculated using the hard-disk plus electrostatic repulsion model. (22 refs.)

103780 Dynamics of a small globular protein in terms of low-frequency vibrational modes. N.Go, T.Noguti, T.Nishikawa (Dept. of Phys., Kyushu Univ. 33, Fukuoka, Japan).
Proc. Natl. Acad. Sci. USA, vol.80, no.12, p.3696-700 (June 1983).
Normal modes of low-frequency vibrations are calculated for a small globular protein, bovine pancreatic tryspin inhibitor. In modes with frequencies below 120 cm^{-1} the protein molecule behaves like a continuous elastic body. Most modes with frequencies above 50 cm^{-1} are shown to behave harmonically within the range of thermal fluctuations at room temperature. Those with frequencies below 50 cm^{-1} show some anharmonicity. Magnitudes of displacements of atoms are mainly determined by the modes with frequencies below 30 cm^{-1}. These very-low-frequency modes contribute significantly to the entropy of the system. The dynamic structure of the globular protein is described as a superposition of harmonic high-frequency motions and coupled anharmonic low-frequency motions of collective variables corresponding to the normal modes of vibration. (17 refs.)

103781 Intermolecular interactions in collagen self-assembly as revealed by Fourier transform infrared spectroscopy. R.J.Jakobsen, L.L.Brown (Biological Spectroscopy Facility, Battelle Columbus Labs., Columbus, OH, USA), T.B.Hutson, D.J.Fink, A.Veis.
Science (USA), vol.220, no.4603, p.1288-90 (17 June 1983).
When a solution of collagen molecules, at neutral pH and moderate ionic strength, is warmed from 4° to 30°C, a spontaneous self-assembly process takes place in which native-type collagen fibers are produced. Events occurring during thermally induced fibrillogenesis process can be monitored, in aqueous media and in real time, by Fourier transform infrared spectroscopic techniques. Tentative assignments of observed spectral bands are given. (18 refs.)

103782 Commensurate, incommensurate and chaotic phase in DNA double helices. H.Toyoki, S.Yomosa (Faculty of Sci., Nagoya Univ., Nagoya, Japan), S.Takeno, S.Homma.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.70-2 (8 Aug. 1983).
It is shown numerically that in the DNA double helix model there exist metastable states other than B-form. Depending on the strength of base pair coupling in double helices, it is found that the phase diagram consists of regimes with commensurate, incommensurate and chaotic phases, indicating the existence of a complex open state in DNA double helices. (4 refs.)

103783 Structural domains in proteins and their role in the dynamics of protein function. J.Janin, S.J.Wodak (Lab. de Biologie Physicochimique, Univ. Paris-Sud, Orsay, France).
Prog. Biophys. & Mol. Biol. (GB), vol.42, no.1, p.21-78 (1983).
This review deals with the following topics: definition of structural domains; analysis of domain movements and segmental flexibility; domain movements in enzyme catalysis and ligand binding; segmental mobility in proteins and t-RNA; domains in protein folding and evolution. (326 refs.)

103784 Splice junctions: association with variation in protein structure. C.S.Craik, W.J.Rutter, R.Fletterick (Dept. of Biochem. & Biophys., Univ. of California, San Francisco, CA, USA).
Science (USA), vol.220, no.4602, p.1125-9 (10 June 1983).
A comparison between eukaryotic gene sequences and protein sequences of homologous enzymes from bacterial and mammalian organisms shows that intron-exon junctions frequently coincide with variable surface loops of the protein structures. The altered surface structures can account for function differences among the members of a family. Sliding of the intron-exon junctions may constitute one mechanism for generating length polymorphisms and divergent sequences found in protein families. Since intron-exon junctions map to protein surfaces, the alterations mediated by sliding of these junctions can be effected without disrupting the stability of the protein core. (42 refs.)

103785 Temperature dependence of the 735 nm fluorescence kinetics from spinach measured by picosecond laser-stream camera system. F.Pellegrino, A.Dagen, P.Sekuler, R.R.Alfano (Phys. Dept., City Coll. of New York, New York, NY, USA).
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.15-23 (July 1983).
The 735 nm fluorescence lifetime (τ) and relative quantum yield (ϕ) of spinach were measured at 90K as a function of excitation fluence. The 735 nm risetime, defined as the time required for the intensity to increase from 10 to 90% of tis maximum value was measured to be 19.6 ± 3 ps at 106K for excitation fluence below 10^{14} photons/cm^2. The fluorescence quantum yield for wavelengths greater than 720 nm revealed no apparent intensity-dependent behaviour over the excitation fluence of 10^{13} to 10^{15} photons/cm^2. The fluorescence decay profile, however, was found to change from a single exponential to a non-exponential behaviour above 3×10^{14} photons/cm^2 per pulse. These results are interpreted in terms of energy transfer from accessory pigments or optically excited antennae of PS I and a lack of energy transfer from the light harvesting 685 nm antennae to the C-705. The temperature dependence of the 735 nm fluorescence lifetime was measured and the excitation energy transfer from C-705 to P-700 reaction centers of PS I is discussed in terms of the electron multiphonon formalism of Jortner (1978) and Yomosa (1976). From the analysis of the data the authors have obtained a mean phonon energy $\langle \hbar\omega \rangle \sim 418$ cm^{-1} and an electron-phonon coupling strength $S=3.7$. (30 refs.)

103786 Evidence against the stage of electron localization on monomeric bacteriochlorophyll (*P*-800) under charge separation in reaction centers. A.Yu.Borisov (Photosynthesis Dept., A.N. Belozersky Lab. of Molecular Biology & Bioorganic Chem., M.V. Lomonosov Moscow State Univ., Moscow, USSR), R.V.Danielius, S.P.Kudzmauskas, A.S.Piskarskas, A.P.Razjivin, V.A.Sirutkaitis, L.L.Valkunas.
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.33-8 (July 1983).
Some theoretical and experimental picosecond data that are in contradiction with the assumption that there exists a stage with electron localization on P-800 in reaction centers during charge separation are presented. (15 refs.)

103787 The effect of external charges on the absorption spectra of porphyrins. Quantum chemical discussion. P.Pancoska, M.Kapoun, L.Skala (Dept. of Chem. Phys., Faculty of Math. & Phys., Charles Univ., Prague, Czechoslovakia).
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.39-46 (July 1983).
The effect of external charges on the absorption spectra of porphyrins in theoretically discussed. The porphyrin chromophore is modeled by the porphin molecule. Three quantum chemical approaches are used: the square-well potential model, and the FEMO-CI and CNDO/S-CI methods. For positive external charges all three methods predict a blue shift of the absorption band; induced changes in the more complex Soret region lead to the red shift of this band. For negative charge, the effect is just opposite. The results agree with available experimental observations on two porphyrin model systems. The effect is discussed from the point of view of the origin of the porphyrin spectral forms in photosynthetic systems in vivo. (20 refs.)

103788 Energy transfer in biflavinyl compounds as studied with fluorescence depolarization [biological light transformation]. A.J.W.G.Visser, J.S.Santema, A.van Hoek (Dept. of Biochem., Agricultural Univ., Wageningen, Netherlands).
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.47-55 (July 1983).
Light absorption, fluorescence and fluorescence anisotropy measurements were performed on two different, dimeric flavin models and on the parent isoalloxazine derivative, either dissolved in chloroform or in the rigid matrix polymethylmethacrylate (PMMA). The optical results in fluid solution and the fluorescence depolarization in PMMA could be well explained by a different intramolecular equilibrium orientation of the flavin constituents. The rate constant for radiationless energy transfer among the flavins within the dimers followed directly from an analysis of the anisotropy decay. (17 refs.)

103789 Spectra of circular dichroism of myocardial actin in respiratory hypoxia. B.G.Dzhinchevedashvili.
Biophysics (GB), vol.27, no.4, p.606-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.587-9 (1982).
It is shown that the secondary structure of Straub actin of the myocardium of dogs with respiratory hypoxia does not differ from normal. The spectra of circular dichroism (CD) at 250-300 nm substantially differ. The fractional composition of pathological actin is practically identical to normal. Change in the CD spectra is apparently due to change in the conformation of the microsurroundings of the aromatic amino acids forming part of the active centres of actin responsible for polymerization. (9 refs.)

103790 Study of monomolecular layers of immunoglobulin G by infrared spectroscopy. V.Ya.Ppopov, A.K.Kurek, L.V.Chasovnikova, N.A.Matveyeva, V.V.Lavrent'ev (Second Pirigiv State Medical Inst., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.624-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.604-8 (1982).
Infrared spectroscopy of multiple disturbed total internal reflection (MDTIR) has been used to study transferred monomolecular layers of immunoglobulin G (IgG) consisting of native protein molecules oriented horizontally or vertically to the surface of the MDTIR element and also molecules exposed to surface denaturing. It is shown that on transfer of the IgG monolayer from the water-air interface to a solid surface the conformation and orientation of the molecules in the monolayer does not change. The values of the thickness of the monolayers consisting of the horizontally or vertically oriented molecules correspond to the sizes of the native IgG molecule. Disturbance of the β-structure of the polypeptide chains during surface enaturing is not recorded. (20 refs.)

103791 Light-induced dynamics of chlorophyll systems studied by neutron spectroscopy. A.Furrer, A.Stockli, W.Halg (Inst. fur Reaktortech., Eidgenoessische Tech. Hochschule, Zurich, Switzerland), W.Kuhlbrandt, K.Muhlethaler, E.Wehrli.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.655-62 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Energy spectra of three chlorophyll-protein systems and of chlorophyll-a in solution were measured using the inelastic neutron scattering technique. The intensities of the observed energy spectra changed significantly when the sample was irradiated by light. This effect is interpreted in terms of electronic-vibrational relaxation mechanisms giving rise to radiationless transitions which enhance the population of the vibrational modes of all the constituents forming the sample either directly or by dissipation. (4 refs.)

103792 Photoabsorption and photoelectron-yield spectra of polypeptides in the vacuum-UV region. S.Iwanami, N.Oda (Res. Lab. of Nuclear Reactor, Tokyo Inst. of Technol., Tokyo, Japan).
Radiat. Res. (USA), vol.95, no.1, p.24-31 (July 1983).
The photoabsorption spectra and the photoelectron-yield spectra in the vacuum-UV region between 1050 and 2400 Å have been measured for the aliphatic homopolypeptide films poly(glycine), poly(L-alanine), and poly(L-valine). By comparing the photoabsorption spectra with the photoelectron-yield spectra, the existence of highly excited states at excitation energies above the first ionization potentials in these polypeptides is conjectured. Implications of these highly excited states are discussed in connection with the concept of the superexcited states in macromolecules such as polypeptides. (25 refs.)

87.16 BIOTHERMICS

103793 Hyperthermia, immunity and metastasis. V.F.Lopatin.
Med. Radiol. (USSR), vol.28, no.7, p.60-5 (July 1983). In Russian.
The problem of the dependency of immunological reactions and metastasis on the conditions of hyperthermial action is reviewed, with reference to the data of many clinical and experimental studies during the past two decades. Literary data on the subject is rather incomplete and often contradictory, largely because, in some analyses of the results of hyperthermial action on immunity and metastasis, inadequate allowance is made for the influence of such factors as the method of heating, the volume of tissue being heated in general of local hyperthermia, and the temperature conditions in a tumour and in healthy tissues. It is concluded that, by the achievement of thermal or thermoradiative action on a tumour, one can expect not only more complete inactivation of the malignant cells of the primary focus, but also the stimulation of antitumoral immunity and decreased probability of the onset of metastasis. (62 refs.) *A.J.B.*

103794 Temperature dependence of spin-label intensity in solutions and its implication in spin-labeled erythrocyte membrane studies. L.W.M.Fung (Dept. of Chem., Loyola Univ. of Chicago, Chicago, IL, USA), M.E.Johnson.
Biophys. J. (USA), vol.43, no.2, p.255-7 (Aug. 1983).
Presents data showing that the increase in intensity upon increasing temperature is primarily related to EPR cavity sensitivity rather than to an increase in concentration of the bound spin labels that are EPR active. (12 refs.)

103795 Handwarming and relaxation in temperature feedback: positive placebo effects. L.Onoda (California State Univ., Northridge, CA, USA).
Biofeedback & Self-Regul. (USA), vol.8, no.1, p.109-14 (March 1983).
Sixteen males and females were randomly assigned to either temperature feedback groups warm-relax (WR) or cool-relax (CR) to determine how successful hand-warming and -cooling alters the subjective report of relaxation. After eight $^1/_2$-hour sessions the WR and CR demonstrated a significant difference in temperature change, but there were no significant main effects in reported subjective relaxation. The reported feelings of relaxation were negatively correlated to the directionality of temperature change and were primarily attributed to nonspecific expectancies. (5 refs.)

103796 How far does thermal damage extend beneath the surface of CO_2 laser incisions?. A.L.McKenzie (Wessex Regional Medical Phys. Dept., Royal South Hants Hospital, Southampton, England).
Phys. Med. & Biol. (GB), vol.28, no.8, p.905-12 (Aug. 1983).
One of the principal advantages of the CO_2 surgical laser over other types available is that there is little evidence of thermal injury extending very far beyond the surface of the laser wound. The degree of such damage is of interest because it affects tissue healing and the likelihood of post-operative infection. This paper presents a simple physical model of tissue irradiated by a CO_2 laser beam. The depth of damage is predicted for the case where the ablation front and the damage wave ahead of it advance together at the same speed. The depth of damage is also calculated for the case of laser pulses of short duration where there has not been time to establish dynamic equilibrium. The results are plotted against local laser power density and show a trend of narrower damage depths with short laser pulses and high power densities. As a consequence, care should be taken not to ablate tissue at low power densities, as occurs when the laser beam is defocused. The predicted damage depths are in broad agreement with histopathological experience. (11 refs.)

103797 Effect of hyperthermia on isolated DNA polymerase-β. I.J.Spiro (Dept. of Radiology, George Washington Univ. Medical Center, Washington, DC, USA), D.L.Denman, W.C.Dewey.
Radiat. Res. (USA), vol.95, no.1, p.68-77 (July 1983).
Hyperthermia has been shown to inhibit the activity of DNA polymerase-β when either the intact Chinese hamster cells or partially purified enzyme samples from CHO cells are heated (42.2 or 45.5°C). However, the loss of activity from heating isolated enzyme samples can be either greater or less than the loss from heating intact cells. For example, treating cells with the membrane-active agent procaine-HCl greatly sensitizes the cells to heat-induced loss of enzyme activity but has no effect on the heat sensitivity of isolated enzyme. Furthermore, the heat sensitivity of the isolated enzyme depends greatly on the purification steps and can be reduced by heating the enzyme in the presence of bovine serum albumin, activated DNA, or Langendorf salts. These observations, considered in relation to others in the literature, suggest that heat inactivation of polymerase-β occurs from heat-induced changes in the intracellular environment, which in turn modify the direct thermal denaturation of the enzyme within the cell. 87.20 MEMBRANE BIOPHYSICS

103798 Generation of a potential on the bilayer lipid membrane in the reaction of proton attachment—separation in the near membrane layers. Yu.N.Antonenko, L.S.Yaguzhinskii (Belozerskii Interfaculty Problem Res. Lab. of Bio-organic Chem. & Molecular Biology, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.658-65 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.635-40 (1982).
It has been found that addition of an uncoupler opposing the concentration gradient of salts of weak acids or bases (sodium acetate and ammonium chloride) leads to the formation of a potential on the BLM, with the plus sign on that side of the membrane where the high concentration of sodium acetate is present, and the minus sign where the concentration of ammonium chloride is high. It is shown that the formation of the potential is due to the appearance of a pH gradient in the unmixed layers. The observed effects are described by an earlier developed model of transfer of weak acids and bases across the BLM. The results indicate that in the presence of gradients of salts of weak acids and bases on the membranes, including biological, potentials may appear in the presence of a protonophore. (11 refs.)

103799 Use of phosphorescent probes for studying model and biological membranes. V.M.Mekler, A.I.Kotel'nikov, G.I.Lihtenshtein, M.A.Berkovich (Inst. of Chem. Phys., Acad. of Sci., Chernogolovka, USSR).
Biophysics (GB), vol.27, no.4, p.665-70 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.641-5 (1982).
Egg lecithin liposomes and rat liver microsomes have been used to analyse the possibilities of phosphorescent probes for investigating membranes. It is shown that to record the diffusion controlled quenching of phosphorescence of erythrosin by stable nitroxyl radicals it suffices to introduce into the liposomes one quencher molecule per 10^4 lecithin molecules. This makes it possible to study the diffusion processes with $D=10^{-5}$-10^{-9} cm^2.sec^{-1}. The use of quenchers of different polarity suggests that the triplet probe erythrosin is incorporated into the liposomes in the region of the polar heads of phosphatidyl choline. The microviscosity of the membrane determined from the rate of quenching of the phosphorescence by the radicals at 20°C is 0.1 M.sec/m^2. The coefficient of lateral diffusion of erythrosin in the liposomes determined from its concentration self-quenching is 1.1×10^{-8} cm^2.sec^{-1}. In the microsomes erythrosin is located in the hydrophobic protions of the proteins and is not accessible to the quencher molecules. (13 refs.)

103800 Transverse deformation of bilayer lipid membranes on electrostriction. V.I.Pasechnik (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.762-3 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.726-7 (1982).
It is shown that a necessary condition for the existence of small values of Young's modulus for bilayer lipid membranes measured in the transverse direction (less than Young's modulus in the longitudinal direction) is the variable thickness of the membrane. The physical meaning of the transverse deformation of the membrane is clarified. (6 refs.)

103801 Thermodynamics and kinetics of protein incorporation into membranes. F.Jahnig (Max-Planck-Inst. fur Biologie, Tubingen, Germany).
Proc. Natl. Acad. Sci. USA, vol.80, no.12, p.3691-5 (June 1983).
The free energy and enthalpy of protein incorporation into membranes are calculated with special emphasis on the hitherto neglected effects of immobilization of protein and perturbation of lipid order in the membrane. The free energy change is found to be determined by the hydrophobic effect as the driving force for incorporation and the protein immobilization effect which leads to a considerable reduction of the free energy gained from the hydrophobic effect. For incorporation of a hydrophobic, bilayer-spanning α-helix, the free energy change obtained is of the order of -15 kcal/mol (1 cal=4.184 J) in agreement with experimental results. The lipid perturbation effect yields only a small contribution to the free energy change due to an energy/entropy compensation inherent in lipid order. This effect dominates the enthalpy change, giving rise to values of the order of 100 kcal/mol with a pronounced temperature dependence around the lipid phase transition as observed experimentally. The kinetics of protein incorporation are even more strongly affected by the lipid perturbation effect, leading to an abrupt decrease of the rate of incorporation below the lipid phase transition. (33 refs.)

103802 Translocation pathway in the catalysis of active transport. C.Tanford (Dept. of Physiology, Duke Univ. Medical Center, Durham, NC, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.12, p.3701-5 (June 1983).
Possible pathways for translocation across a membrane in active transport processes are examined theoretically. Thermodynamic and kinetic requirements are readily satisifed by an alternating-access mechanism of the kind that has been proposed in the past by several investigators. The essential features of this mechanism (for transport of a single species) are shown to be defined by four explict conditions. (i) The transport protein must have at least two distinct conformation states, each accessible from only one side of the membrane. (ii) Binding affinity for the transported species is high in the state accessible from the uptake side of the membrane and much lower in the state accessible from the discharge side. (iii) The change from one conformation to the other involves movement of the binding site itself (with the transported species remaining attached) or rearrangement within the site that is topologically equivalent to such movement. (iv) Return to the original conformation occurs with unoccupied binding sites. The analysis demonstrates that a passage through the membrane that is simultaneously accessible from both sides cannot be used for active transport regardless of what the energetics of opening or closing of the passage may be. (22 refs.)

103803 Structure-function relationships for a voltage-dependent ion channel: properties of COOH-terminal fragments of colicin E1. M.vB.Cleveland (Dept. of Biological Sci., Columbia Univ., New York, NY, USA), S.Slatin, A.Finkelstein, C.Levinthal.
Proc. Natl. Acad. Sci. USA, vol.80, no.12, p.3706-10 (June 1983).
The effects of planar lipid bilayer membranes of carboxyl-terminal fragments derived from the bacteriocin colicin E1 by either proteolysis or CNBr cleavage are indistinguishable from those of the voltage-dependent parent colicin molecule. An upper limit to the length of the COOH-terminal peptide required for channel formation is 152 amino acid residues from the COOH-terminal end, as indicated by the CNBr fragment. In addition, use of carboxypeptidase shows that the COOH-terminal end of the molecule remains on the side of the membrane to which it was added. COOH-terminal peptides of colicin E1 spontaneously associate with oil or hexane droplets in an aqueous system and remain at the interface between the two phases to a significantly greater degree than other colicin E1 fragments or cytochrome *c*. These results, together with the amino acid sequence, suggest a model wherein the colicin E1 channel is formed first by spontaneous attachment to a membrane of an α-helical hairpin centered at a 35-residue hydrophobic region near the COOH-terminal end. Application of a potential of the correct polarity then

facilitates a major conformational change in the protein, allowing insertion of the remainder of the COOH-terminal end to form the open channel. (20 refs.)

103804 Linearisation by optimal control. C.L.Simionescu (Dept. of Analysis, Univ. of Brasov, Brasov, Rumania).
Control of Distributed Parameter Systems 1982. Proceedings of the Third IFAC Symposium, Toulouse, France, 29 June-2 July 1982 (Oxford, England: Pergamon 1983), p.443-50
The electrochemical equilibrium of some excitable membranes is described by a quasilinear system of differential and partial differential equations, the unknowns being the electrical potential and the functions describing the chemical properties of the excitants. The model has been established by Hodgkin and Huxley (1952) and then reconsidered by Noble (1962) and Besseau (1971). The aim of the paper is to obtain approximations for the solution of the Hodgkin-Huxley and Korteweg-de Vries-Burgers equations, by means of both concepts. (16 refs.)

87.25 CELLULAR BIOPHYSICS

103805 The biomedium. Adsorbed water as a model for the aqueous medium supporting life functions. G.F.Cerofolini (Istituto di Chimica Fisica, Politecnico di Milano, Milano, Italy).
Adv. Colloid & Interface Sci. (Netherlands), vol.19, no.1-2, p.103-36 (July 1983).
A proposed new model for water in biosystems assumes that most of the intercellular water is adsorbed on macromolecules. This model is useful to describe several phenomena characteristic of the cellular level: Na^+/K^+ ratio, metabolism, growth, reproduction and morphology. (45 refs.)

103806 On the slow component of P-515 and the flash-induced reduction of cytochrome *b*-563 in chloroplast membranes. O.van Kooten, A.G.M.Gloudemans, W.J.Vredenberg (Lab. of Plant Physiological Res., Agricultural Univ., Wageningen, Netherlands).
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.9-14 (July 1983).
Absorbance changes of P-515 and of cytochrome *b*-563 induced by double flashes (spaced by a dark time of 125 ms) have been studied in intact spinach leaves. The slow component (reaction II) of the P-515 response is only observed in a first flash, whereas cytochrome *b*-563 oxido-reduction occurs in both flashes. This leads to the conclusion that the slow phase of P-515 cannot be taken as a measure of an all-or-none electrogenic electron transfer in a Q-cycle. (29 refs.)

103807 Study of charge separation at the reaction centres of photosystem II of higher plants by magnetic modulation of fluorescence. L.I.Kolesnikova, M.M.Triebel, Ye.L.Frankevich (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.581-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.565-71 (1982).
The modulation of the fluorescence of the leaves of higher plants by an external magnetic field has been studied. It was found that the intensity of fluorescence increases on exposure to a magnetic field by values of up to 0.3 per cent on induction $B\simeq10$-20 mT. The magnetic effect is linked with spin phenomena on charge separation in photosystem II. The characteristic of the magnetic effect for fluorescence in different portions of the induction curve have been studied and it is shown that two types of magnetic effect exist corresponding to the open and closed reaction centres. In the first the field of semi-saturation of the effect $B_{1/2}=20$ mT, in the second $B_{1/2}=1.6$ mT. The lifetimes of the charge pairs at the open and closed centres have been determined (250 psec and >6 nsec). (17 refs.)

103808 Effect of dispersion of electric parameters of bacterial cells on their orientation in an alternating electric field. V.M.Fomchenkov, A.L.Mazanov, V.N.Brezgunov (All Union Appl. Microbiology Res. Inst., Serpukhov, USSR).
Biophysics (GB), vol.27, no.4, p.692-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.665-9 (1982).
On the basis of an electrophysical model of the bacterial cell the authors calculate the frequency dependence of the orientating moment of forces acting on it in an alternating electric field. The dependence of the relative value of the moment on the electric and geometric parameters of the model is studied. It is shown that allowance for the frequency dispersion of the electric parameters leads to a change in the course of the frequency dependence of the orienting moment in the region of low and medium frequencies. The results correspond to those of electrooptical measurements made on E. coli cells. (15 refs.)

103809 Analysis of the cable structure of blue-green algae. S.A.Levin, T.V.Potapova, V.P.Skulachev, L.M.Chailakhyan.
Biophysics (GB), vol.27, no.4, p.714-19 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.684-8 (1982).
Using extracellular electrodes the authors have studied special aspects of the electrical responses on local illumination of filamentous cyanobacteria (blue-green algae) Phormidium uncinatum. Recording the electrical responses at different distances from the site of illumination, and comparison of these data with results obtained on a physical model of Ph. uncinatum, made it possible to evaluate the parameters of the cable which may serve as a model of the object: $RC=440$ sec/cm^2 and $\lambda_{min}>0.07$ cm. From these values, and assuming that the membrane capacitance $C=10^{-6}$ F/cm^2, the authors evaluate the intercellular resistance $R_M=10^7\ \Omega$ and conductivity of the surface membrane $G_{Sp}\leq10^{-6}\ \Omega^{-1}\ cm^{-2}$. (5 refs.)

103810 Model of mechanical auto-oscillations in Myxomycetes plasmodium. Yu.M.Romanovskii, N.P.Khors (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.740-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.707-10 (1982).
A mathematical model of the push-pull movements of the protoplasma is proposed. The model is intended for a two-chamber system the auto-oscillations of which are caused by the action of the active force on contractions of the filaments of the membrane of the strand. The evaluations of the speed of flow of the protoplasma, the decay time in a passive system and also the general course of the time relations of speed and the changes in radius also agree with the experimental data. (12 refs.)

103811 Symmetry of the process of electron transfer on the donor and acceptor sides of the photosynthetic reaction centre. V.P.Shinkrev, A.B.Rubin (Biology Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.756-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.722-4 (1982).
The scheme of electron transfer in photosynthetic reaction centres (PRCs) is considered. If this scheme is inverted by 180° for holes then the scheme obtained is entirely analogous to the original scheme. From comparison of these schemes it follows that the kinetic behaviour of the oxidised forms of the carriers denoted $A_s...A_1$ corresponds to that of the reduced forms of the carriers denoted $D_1...D_n$. On replacing electron by hole transfer there is a change in the sign of the potentials of semi-reduction of the electron carriers to the opposite. The kinetic duality of electron and hole transfer in the donor and acceptor parts otf the PRC makes it possible, is analysing electron transfer, to confine the analysis merely to the donor or merely to the acceptor side of the PRC. (6 refs.)

103812 Effect of plant 'hardening' on the crystallization of intracellular water in the tissues. N.G.Bakradze, K.M.Moistrapishvili, L.V.Keshelashvili (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).
Biophysics (GB), vol.27, no.4, p.774-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.736-8 (1982).
The process of preparing a plant for exposure to low-temperature is called 'hardening'. It has been shown that a result of 'hardening' in a certain cooling regime the branches of many species of woody plants withstand the temperature of liquid nitrogen (I. Tumanov and O. Krasavtsev, 1959). This means that with stepped fall in the temperature of the ambient medium definite rearrangements occur in plants leading to a change in the state of the system giving it the ability to survive after exposure to such low temperatures. In this paper the authors try to describe the process of 'hardening' in terms of crystallization of the intracellular water in the tissues of the grapevine. Results for core, xylem, pholem and primary cortex tissues are reported. The results show that the process of plant 'hardening' substantially changes the physical properties of the system and more prolonged investigations of this process may give answers to many questions connected with the front hardiness of perennial plants. (3 refs.)

103813 Spectroscopic discrimination of the three rhodopsinlike pigments in Halobacterium halobium membranes. J.L.Spudich (Dept. of Anatomy, Albert Einstein Coll. of Medicine, New York, NY, USA), R.A.Bogomolni.
Biophys. J. (USA), vol.43, no.2, p.234-6 (Aug. 1983).
Membranes of Halobacterium halobium contain two photochemically retinal pigments in addition to the proton pump bacteriorhodopsin. One, halorhodopsin, is also an electrogenic ion pump with a fast (on a scale of milliseconds) photoreaction cycle. The other, s-rhodopsin, is active in the same spectral region, but has a much slower photoreaction cycle (on a scale of seconds). s-rhodopsin is not an electrogenic ion pump and its properties suggest it functions as the receptor pigment for phototaxis. All three pigments have very similar absorption spectra. The recent isolation of mutants deficient in both bacteriorhodopsin and halorhodopsin and in retinal synthesis has allowed the authors to resolve the absorption spectra of s-rhodopsin and halorhodopsin. At neutral pH s-rhodopsin has an absorption maximum at 587 ± 2 nm and halorhodopsin at 578 ± 2 nm. At pH 10.8, λ_{max} for s-rhodopsin is shifted to 552 nm and extinction decreases slightly (15%) while halorhodopsin loses all extinction above 500 nm. Both effects are fully reversible and allow determination of the amounts of s-rhodopsin and halorhodopsin in membrane preparations containing both pigments. Both pigments were present in earlier studies of *H.* halobium membranes, and in view of these findings, several observations must be reinterpreted. (19 refs.)

103814 Movement of polymorphonuclear leukocytes: an elastimetry analysis. A.T.W.Cheung, M.E.Miller, E.J.Kawaoka (Dept. of Pediatrics, Univ. of California, Davis, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.53-61 (1983).
By utilizing the technique of cell elastimetry, which measures the negative pressure required to aspirate human polymorphonuclear leukocytes (PMNs) into a micropipette, a correlation between PMN deformability and cellular movement is confirmed. The effects of the synthetic chemotactic peptide, N-formyl-methionyl-leucyl-phenylalanine (f-met-leu-phe) on the deformability and chemotaxis of PMNs have been investigated, and a relationship between peptide concentrations and PMN deformability, which parallels the effects of the peptide on filter (chemotactic) studies, has been established. Experimental evidence indicates that alterations in PMN deformability occur as a natural consequence of stimulation of PMNs with a chemoattractant and that cellular deformation is a prerequisite to PMN movement. (14 refs.)

103815 Elastooptic photon signal modulation in collagenic fiber optics of tendon. K.E.Simanonok (Dept. of Animal Physiology, Univ. of California, Davis, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.83-92 (1983).
In a test of a hypothesis of cell-to-cell communication via their endogenous photon emissions, the nearly pure collagen fibers in tendon were found to exhibit the fiber optic property of axially conducting light, providing a mechanism for photon exchange between nonadjacent cells. Further, it was found that light penetrates farther along the tendon fibers when tension is applied to an end-illuminated tendon, establishing that an elastooptic mechan-

ism exists for the modulation of photon signals in transit between cells, in the hypothesized system of cell-to-cell photon communication. (10 refs.)

103816 The effect of hyperthermia on hemopoietic progenitor cells of the mouse. G.Van Zant, D.Flentje, M.Flentje (Mallinckrodt Inst. of Radiology, Washington Univ. School of Medicine, St. Louis, MO, USA).
Radiat. Res. (USA), vol.95, no.1, p.142-9 (July 1983).
The effect of heat on four lineage-specific clonogenic cells from mouse bone marrow has been studied. The thermal sensitivities of two red cell precursors, one primitive (BFU-E) and one more differentiated (CFU-E), a granulocyte-macrophage precursor (CFU-GM), and a megakaryocyte precursor (CFU-M) were determined after exposure to 42, 43, and 44°C. It was found that the erythroid precursors were much more heat sensitive than either the CFU-GM or CFU-M. At 42°C the CFU-E and BFU-E had a D_0 of about 30 min, while the CFU-GM and CFU-M had D_0 values of about 60 min. Thus the four progenitors could be divided into two distinct classes with respect to their sensitivity to hyperthermia. These results suggest that erythropoiesis is more likely to be suppressed than either thrombopoiesis or leukocyte production when hyperthermia is applied in a clinical setting. (24 refs.)

103817 Participation of photosystem II in regulation of photosynthetic electron transport in the green alga Chlamydobotrys stellata. D.Mende, W.Wiessner (Univ. Gottingen, Gottingen, Germany).
Photobiochem. & Photobiophys. (Netherlands), vol.6, no.1, p.1-7 (July 1983).
Reports on 559 nm absorption changes induced by single flash illumination and on delayed light emission after single and double flash excitation. (1) In autotrophic cells an absorption change at 559 nm can be seen only after DCMU treatment. Its reduction and oxidation half-times are 150 and 350 μs, respectively. After adaptation to photoheterotrophy, the 559 nm signal is present already without any treatment. The reduction proceeds within <5 μs and its oxidation within 60 μs. (2) Delayed light emission by autotrophic cells shows a <5 μs component after single flash excitation and a 35 μs component after double flash excitation. Adaptation to photoheterotrophic growth conditions leads to a disappearance of the <5 μs and 35 μs components and brings about a 60 μs component after single as well as after double flash excitation. The results are discussed with respect to the function of cytochrome b_{559} in a cyclic Photosystem II which disconnects the photosynthetic electron transport between Photosystems II and I. (28 refs.)

103818 Transepithelial transport in cell culture. A theoretical and experimental analysis of the biophysical properties of domes. C.Tanner, D.A.Frambach, D.S.Misfeldt (Palo Alto Veterans Administration Medical Center, Palo Alto, CA, USA).
Biophys. J. (USA), vol.43, no.2, p.183-90 (Aug. 1983).
Dissociated cells of transporting epithelia, when cultured on an impermeant substratum, form polarized monolayers frequently characterized by the presence of domes. If the assumption is made that the monolayer exhibits a uniform stretch modulus of elasticity and tension of cell-dish adhesion, *Ta*, then biophysical properties of the epithelium can be predicted. The authors have shown that for such epithelia, domes should (a) have circular bases, (*b*) be sections of spheres with a constant height to radius, h/r, ratio, (*c*) have a dome-wall tension, T_w, that is constant, and (*d*) have a dome volume that is a function of radius alone. Additionally, a Laplace equation derived for this geometry predicted the hydrostatic pressure from within to outside domes as a decreasing function of radius alone. By microscopy, domes had predominantly circular bases and were found to be sections of spheres with a constant height, *h*, to radius, *r*, ratio of 0.684. Using the Laplace equation derived for this geometry and measurements of ΔP and *r*, the tension of cell-dish adhesion, T_a, and dome-wall tension, T_w, were found to be constants of 6.60 and 7.08 torr, respectively. Combining the constants for T_a and h/r ratio, and the fact that domes are sections of spheres, ΔP and dome volume were shown to be known functions of radius alone. In addition, the modulus of elasticity of the epithelium was calculated to be 4.82×10^3 dyn/cm^3. (13 refs.)

103819 Estimating kinetic constants from single channel data. R.Horn, K.Lange (Dept. of Physiology & Biomath., Univ. of California at Los Angeles School of Medicine, Los Angeles, CA, USA).
Biophys. J. (USA), vol.43, no.2, p.207-23 (Aug. 1983).
The process underlying the opening and closing of ionic channels in biological or artificial lipid membranes can be modeled kinetically as a time-homogeneous Markov chain. The elements of the chain are kinetic states that can be either open or closed. A maximum likelihood procedure is described for estimating the transition rates between these states from single channel data. The method has been implemented for linear kinetic schemes of fewer than six states, and is suitable for nonstationary data in which one or more independent channels are functioning simultaneously. It also provides standard errors for all estimates of rate constants and permits testing of smoothly parameterized subhypotheses of a general model. The authors illustrate their approach by analysis of single channel data simulated on a computer and describe a procedure for analysis of experimental data. (46 refs.)

103820 Diffusion profiles of Na$^+$-fluorescein in frog ventricular muscle. G.Salama, M.Morad (Dept. of Physiology, Univ. of Pennsylvania School of Medicine, Philadelphia, PA, USA).
Biophys. J. (USA), vol.43, no.2, p.225-9 (Aug. 1983).
Frog ventricular muscle strips were placed on a single sucrose-gap chamber to measure the interdiffusion of solutes across the sucrose-Ringer's solution partition. Steady-state diffusion profiles of fluorescein sodium developed along the axis of the muscle in the physiological node by continuously perfusing the sucrose pool with 210-mM sucrose plus fluorescein (5-10 mM). Fluorescein was found to diffuse freely through the extracellular space of the ventricular muscle without binding to the tissue. The fluorescence of Na$^+$-fluorescein in the muscle (measured at 530 ± 30 nm) varied linearly with the dye concentration in the sucrose perfusate. The diffusion profiles of dye in the test node depended on the tightness or snaring of the muscle strip by the latex diaphragms, the diameter of the muscle strip, and changes in hydrostatic pressure between the sucrose and Ringer's solution pools. Fluorescein concentration in the cross section of test node closest to the latex partition (sucrose-Ringer's solution interface) ranged between 4-13% of the dye concentration in the sucrose pool. These values are more than five times smaller than those estimated theoretically, assuming free diffusion. The experimental findings indicate that the presence of a physical barrier, such as a rubber diaphragm, limits free interdiffusion of solutes across the sucrose gap. The presence of such a barrier thus prevents large concentration gradients from occurring in the extracellular spaces along the physiological node. (12 refs.)

103821 Single voltage-dependent chloride-selective channels of large conductance in cultured rat muscle. A.L.Blatz, K.L.Magleby (Dept. of Physiology & Biophys., Univ. of Miami School of Medicine, Miami, FL, USA).
Biophys. J. (USA), vol.43, no.2, p.237-41 (Aug. 1983).
Single-channel currents of an anion-selective channel in the plasma membrane of cultured rat muscle cells (myotubes) were recorded with the patch-clamp technique (O.P. Hamill et al., Pfluegers Arch. Eur. J. Physiol., 391, p.85-100, 1981). The channel is selective for Cl$^-$ over cations, and has an unusually large single-channel conductance of $\sim$430 pS in symmetrical 143 mM KCl. The channel is often active at 0 mV, opening and closing spontaneously. When active, steps from 0 mV to either negative or positive membrane poten-

tials close the channel to an apparent inactivated state. The mean effective time that a channel is open before it inactivates is ~1.19 s for steps to −30 mV and 0.48 s for steps to +30 mV. Returning the membrane potential to 0 mV results in recovery from inactivation. Calcium ions are not required for channel activity. (25 refs.)

103822 Transit time conception for ion diffusion through membrane channels (biomembranes). H.Schroder (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
J. Chem. Phys. (USA), vol.79, no.4, p.1991-6 (15 Aug. 1983).
The diffusion path of an ion is considered as a one-dimensional random walk between binding sites along the channel, where the potential energy profile may consist of an arbitrary sequence of different barriers and binding sites. It is shown that the conception of discrete transit times leads to a very simple calculation of transport quantities such as diffusion constant and stationary transmembrane current. The diffusion constant obtained is the discrete counterpart of the diffusion constant obtained from the exact solution of the Smoluchowski equation. The resulting current-voltage characteristics indicate that the assumption of a discrete random walk represents a fairly good approximation. Furthermore, the first passage time problem for the present model is discussed and solved for the homogeneous case with the aid of a difference equation for successive first passage times. (14 refs.)

103823 Rate theoretical analysis of ion transport in membrane channels with elastically bound ligands (biomembranes). H.Schroder (Tech. Hochschule Darmstadt, Darmstadt, Germany).
J. Chem. Phys. (USA), vol.79, no.4, p.1997-2005 (15 Aug. 1983).
The presentation consists of two parts. In the first one, a model Hamiltonian for a channel with elastically bound ligands is constructed. In the second one, escape rates are derived from the Hamiltonian and transport properties of the channel are discussed considering diffusion of ions as a random walk between binding sites. Rate theory as traditionally applied considers a potential energy profile as a sequence of rigid barriers. A realistic molecular channel, however, consists of elastically bound atomic groups (ligands) which are subject to temperature induced motion, and which can respond more or less to the presence of an ion. The elastic deformation of the channel gives rise to a correction of the interaction energy between the ion and the channel as a whole. The result is an effective potential for fixed position of the ion. Moreover, due to the finite masses of the ligands and their coupling to the ion in motion, the latter will experience inertia effects, which lead to an effective ion mass. It is shown that the introduction of an effective potential requires a canonical transformation of the generalized momenta. The corresponding Hamiltonian is directly used to calculate the jumping rates over a barrier, with the effective ion mass depending on all ligand masses and the geometry of the channel. In the present case, a model Hamiltonian for a helical arrangement of dipoles as hindered rotators is discussed, followed by an investigation of the diffusion constant for this system. (22 refs.)

103824 In situ electrophoresis of cancer cell membrane components. Y.-S.Nie, Y.-B.Feng, M.-Q.Tan (Inst. of Biophys., Acad. Sinica, Beijing, China), N.-M.Chao, D.-P.Zhao.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.317-24 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Biomembranes show some properties of a liquid crystal. The molecules of the membrane can diffuse along the membrane plane. ISE (in situ electrophoresis) is one of the new techniques to measure the lateral diffusion of the molecules. By this technique, the authors studied the membrane fluidity of Ehrlich ascitic cancer cell of a mouse, and obtained the diffusion coefficient $D=3.2\times10^{-10}$ cm^2/sec and the electrophoretic mobility $m=1.3\times10^{-4}$ (μ/sec)/(v/cm) of the Con A receptors of the membrane at 22°C. A larger dispersion of the diffusion coefficient was noticed. (10 refs.)

103825 Diffusion and the physics of chemoreception. F.W.Wiegel (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).
Phys. Rep. (Netherlands), vol.95, no.5, p.283-319 (May 1983).
This review provides a manual which enables the reader to perform calculations on the rate with which a biological cell can capture certain chemical compounds (ligands) which are essential to its survival and which diffuse in its environment. After a discussion of spatial diffusion and the capture of ligands by a single receptor in the cell membrane, the theory of one-stage chemoreception is developed for the general case in which the cell is spherical and arbitrary forces act between the ligand and the cell. The method can also be applied to cells with other shapes. Next the author discusses membrane diffusion and develops a theory of two-stage chemoreception. Some hydrodynamic effects are also discussed. (73 refs.)

103826 Cell polarity: endogenous ion currents precede and predict branching in the water mold Achyla. D.L.Kropf (Nat. Jewish Hospital & Res. Center, Denver, CO, USA), M.D.A.Lupa, J.H.Caldwell, F.M.Harold.
Science (USA), vol.220, no.4604, p.1385-7 (24 June 1983).
The hyphae of the water mold Achyla bisexualis generate electrical currents that enter the growing tips and leave farther back. An inward-moving current also precedes branching and predicts the site of branch emergence; during the branching process, the current at the original tip declines or even reverses transiently without any change in growth rate. The inward current probably acts as an early signal during branch differentiation. The flow of specific ions rather than the flow of electrical charge probably serves to localize growth. (13 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

103827 Effect of discreteness of charge on the potential distribution in bilayer lipid membranes. M.M.Kozlov, V.S.Markin (Inst. of Electrochem., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.652-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.629-34 (1982).
The potential of discrete charges located in the plane at a certain depth within the membrane is considered. In the approximation of the constant dielectric permeability of the membrane an expression has been found for the micropotential distribution. The case of charges on the membrane surface is separately considered. A refined variant of the method of the cutout disk is developed making it possible with good accuracy to find the potentials from discrete lattices. (10 refs.)

103828 Two components of the calcium current of mollusc neurones. N.K.Chemeris, M.A.Poskonova, B.Yu.Kafengauz (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.4, p.763-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.727-9 (1982).
Reports voltage clamp experiments on dialysed neurones of the mollusc Limnaea stagnalis. From the result it is concluded that, at a minimum, there are 2 pharmacologically distinguishable Ca^{2+} conducting channels having rapid and slow inactivation. (6 refs.)

103829 Dependence of cellular potential on ionic concentrations. Data supporting a modification of the constant field equation. D.C.Chang (Dept. of Physiology, Baylor Coll. of Medicine, Houston, TX, USA).
Biophys. J. (USA), vol.43, no.2, p.149-57 (Aug. 1983).
The resting potential in the squid axon has been measured at various concentrations of Cl, K, Na, and Ca ions. The results of these measurements are compared with the Goldman-Hodgkin-Katz (GHK) equation and a modified constant field equation. This modified equation was derived by including currents carried by divalent ions and the effects of the unstirred layer and the periaxonal space. It is shown that, although the GHK equation can fit the V vs. $[K]_0$ data well, it has difficulty explaining the observed dependence of V on $[Na]_0$ when the axon is bathed in K-free artificial sea water. The use of the modified constant field equation removes this difficulty. (21 refs.)

103830 EMG levels in the occipitofrontalis muscles under an experimental stress condition. D.W.Pritchard, M.M.Wood (Flinders Univ. of South Australia, Bedford Park, Australia).
Biofeedback & Self-Regul. (USA), vol.8, no.1, p.165-75 (March 1983).
In view of the importance attached to the frontalis muscles by researchers into the etiology of head pain and its treatment by biofeedback techniques, it is surprising that no data have yet been reported on the functioning of the occipitalis muscles, which have a close physiological relationship to the frontales. This study explores the response of the frontalis and occipitalis muscles under a condition of experimental stress. Migraine and tension-headache sufferers were separately compared with a headache-free control group under four conditions: baseline, while listening to instructions, while carrying out an auditory vigilance task, and for a further resting period equivalent to baseline. Results showed that tension levels in the frontalis muscles were not elevated at rest in any of the experimental groups, nor were they significantly responsive to the experimental task. The occipitales however proved to have significantly higher levels in both the tension-headache and migraine groups during the task and recovery periods. The results for the tension group reached significance because of a drop in control group values. These results may have significance in determining the best site for electrode placement in biofeedback. (50 refs.)

103831 Cerebellar stimulation for spasticity. J.R.Bloedel, T.J.Ebner (Univ. of Minnesota Medical School, Minneapolis, MN, USA).
IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.3, p.36-43 (Sept. 1983).
This review focuses on the research underlying the development of cerebellar stimulation for treating spasticity. The authors consider: the pathophysiological characteristics of spasticity; the role of the cerebellum in motor behaviour; stimulation of the cerebellum to treat spasticity; the effects of cerebellar stimulation in nonprimates; studies in spastic primates. (6 refs.)

103832 Stationarity, randomness, and serial dependence in neuronal spike trains. C.J.Sherry, W.R.Klemm (Dept. of Biology, Texas A&M Univ., College Station, TX, USA).
J. Electrophysiol. Tech. (GB), vol.10, no.2, p.59-73 (1983).
Spike trains without obvious serial dependencies are commonly described as reflecting a renewal process, in which the intervals are randomly and independently generated. The authors present a simple, straightforward but statistically rigorous way to test for randomness and stationarity in neuronal spike trains. This method is based on quantile analysis of cumulative probability distributions. The method can be used to test null hypotheses about any two interval distributions. Application of the method for spike trains from rat cerebellar cortex revealed that randomness and independence can be separate phenomena that require separate evaluation. (19 refs.)

103833 Relationships between characteristics of electrical stimulation muscle pain and blink responses in man. R.Duranti, R.Galletti, T.Pantaleo (Univ. Degli Studi, Florence, Italy).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.637-44 (June 1983).
Reports research on 11 healthy volunteers with the aim of investigating the relationship between blink response, a feature of the startle reaction, and muscular pain evoked by muscle electrical stimulation (train of stimuli). At a repetition rate of 0.1 Hz, a close relationship was found between the threshold for muscle pain and that for the blink response, without apparent habituation. At the same rate and with stimulation intensity maintained at pain threshold, the subject could voluntarily inhibit the blink response, but not pain. Under the same conditions both pain and blink response were inhibited during a mental task. By increasing the current intensity pain became more intense and the blink response tended to increase in amplitude and to decrease in latency. Similar effects were achieved by increasing the repetition rate with the current intensity maintained at pain threshold. Habituation of the blink response, but not of pain, was found at repetition rates of 1 Hz or more. Present results indicate that nociceptive inputs from muscle have a facilitatory effect on central mechanisms subserving the blink response. It is suggested that the comparative analysis of pain sensation and the blink response may be a useful tool for pain research in man. (36 refs.)

103834 Modelling compound action potentials of peripheral nerves in situ. III. Nerve propagation in the refractory period. D.F.Stegeman (Lab. of Medical Phys. & Biophys,, Univ. of Nijmegen, Nijmegen, Netherlands), J.P.C.De Weerd, S.L.H.Notermans.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.668-79 (June 1983).
For pt.II see ibid., vol.54, p.516-29, 1982. Compound nerve action potentials (CAPs) of sural nerves of health persons were measured in the relative refractory period of the fibres. Double stimuli were used with interstimulus intervals ranging from 0.7 and 4.0 msec. The CAP latency increase, its amplitude decrease and its wave shape alterations with decreasing interstimulus interval are discussed, using a model description. Recovery functions for the single fibre action potential in the relative refractory period are defined. These recovery functions, however, cannot sufficiently explain the CAP amplitude diminutions actually measured. Apparently in the relative refractory period increasing number of fibres ceases to propagate an action potential when the stimulus interval is shortened. This effect, which is caused by subthreshold stimulation, predominantly involves the slower fibres. The usual derivation of refractory period parameters in clinical practice is reviewed. (32 refs.)

103835 Stretch reflex modulation during a cyclic elbow movement. W.A.MacKay, H.C.Kwan, J.T.Murphy, Y.C.Wong (Dept. of Physiology, Univ. of Toronto, Toronto, Ontario, Canada).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.687-98 (June 1983).
Small torque pulses were pulses were delivered to the forearm in order to test the stretch reflex of the brachialis and triceps arm muscles in 11 normal subjects performing a cyclic movement about the elbow in the horizontal plane. The flexion-extension movement was paced by a metronome and performed under various loading conditions. Reflexes for each muscle were tested either in each 50 msec segment of the 2 sec cycle period, or in a smaller number of selected phases. A late reflex, appearing at a latency of about 60 msec, was modulated extensively during the movement cycle. The amplitude of the late reflex increased markedly at the onset of a muscle contraction. In many of the subjects reflex responsiveness began to increase as early as 200 msec prior to the onset of voluntary muscle activity. Peak reflex responses were elicited by stimuli delivered 100-150 msec prior to the peak rate of increase of dynamic load. The increase in responsiveness was followed by a drop which was generally coincident in time with the peak rate of increase of the load opposing muscle contraction. The modulation of the late reflex is appropriately timed for reflex-generated tension to help counteract dynamic loads, intrinsic to the movement. (31 refs.)

103836 Spectral analysis of neocortical and hippocampal EEG in the protein malnourished rat. J.D.Bronzino, K.Austin, C.J.Siok, C.Cordova, P.J.Morane (Trinity Coll., Hartford, CT, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.699-709 (June 1983).
Power spectral analysis techniques were utilized to quantify changes in the cortical and hippocampal EEG obtained from rats reared on either an 8% or 25% casein diet as they mature from 14 to 22 days of age. Analyses of the power spectral data obtained from the frontal cortex of rats reared on the 25% casein diet during this preweaning period (14-22 days) indicated increases in the power in the 0.5-3.5 c/sec frequency band primarily during slow-wave sleep. Prenatal protein malnutrition (8% casein diet) significantly reduced the low frequency power content in the cortical EEG obtained during slow-wave sleep at 18 and 22 days of age. Analyses of power spectral data obtained from the hippocampal EEG during REM sleep also revealed developmental and diet-related differences. The frequency at which the peak power occurs in the theta band (4-11 c/sec) was found to increase normally in a linear fashion from 14 to 22 days of age (from 4.4 to 5.5 c/sec) in rats reared on the 25% casein diet. In addition, power in the 4-7 c/sec band significantly increased during this preweaning period. Prenatal protein malnutrition significantly slowed the development of theta frequency and produced higher values of power in the component of theta rhythm. (25 refs.)

103837 Simulation of macro EMG motor unit potentials. S.Nandedkar, E.Stalberg (Dept. of Clinical Neurophysiology, Univ. Hospital, Uppsala, Sweden).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.52-62 (July 1983).
Macro EMG motor unit potentials (MUPs) have been simulated. The effects on MUP parameters of number of fibres, fibre diameter, end-plate scatter, nerve branch delay, motor unit territory and electrode position have been studied. The MUP shape is sensitive to electrode position in the vicinity of the end-plates. It is mainly reflecting the end-plate scatter and the nerve delays. Away from the end-plates the wave shape is principally determined by the fibre diameter distribution. Total number of muscle fibres and their mean diameter act as gain factors at all recording positions. In the simulations the area of the signal appears to be a better measure of the strength of the motor unit than the amplitude. Macro EMG offers a much less selective recording than conventional EMG and single fibre EMG and therefore new aspects of the motor unit can be quantified. Preliminary results from simulations of neuromuscular disorders are consistent with actual findings. (22 refs.)

103838 The dielectric properties of the cerebellum, cerebrum and brain stem of mouse brain at radiowave and microwave frequencies. N.R.V.Nightingale (Dept. of Phys., Queen Elizabeth Coll., London, England), V.D.Goodridge, R.J.Sheppard, J.L.Christie.
Phys. Med. & Biol. (GB), vol.28, no.8, p.897-903 (Aug. 1983).
The relative permittivity and conductivity of the cerebellum, cerebrum and rain stem of mouse brain were measured at a temperature of 37°C over a frequency range of 72 MHz to over 5 GHz using time-domain spectroscopy. An analysis of the data suggests that the water exists in various forms of binding with an average relaxation frequency less than free water. (10 refs.)

103839 Potassium currents in the frog node of Ranvier. J.M.Dubois (Lab. de Neurobiologie, Ecole Normale Superieure, Paris, France).
Prog. Biophys. & Mol. Biol. (GB), vol.42, no.1, p.1-20 (1983).
This review summarises the different results in the literature concerning the potassium currents of frog node and Ranvier, and compares the properties of the nodal K channels to those of K channels in other preparations. (95 refs.)

103840 Inhibitory conductance changes at synapses in the lamprey brainstem. M.R.Gold, A.R.Martin (Dept. of Physiology, Univ. of Colorado School of Medicine, Denver, CO, USA).
Science (USA), vol.221, no.4605, p.85-7 (1 July 1983).
Although the conductance and kinetic behavior of inhibitory synaptic channels have been studied in a number of nerve and muscle cells, there has been little if any detailed study of such channels at synapses in the vertebrate central nervous system or of the relation of such channels to natural synaptic events. In the experiments reported here, current noise measurements were used to obtain such information at synapses on Muller cells in the lamprey brainstem. Application of glycine to the cells activated synaptic channels with large conductances and relaxation time constants (70 picosiemens and 33 milliseconds, respectively, at 3° to 10°C). Spontaneous inhibitory synaptic currents had a mean conductance of 107 nanosiemens and decayed with the same time constant. In addition, the glycine responses and the spontaneous currents had the same reversal potential and both were abolished by strychnine. These results support the idea that glycine is the natural inhibitory transmitter at these synapses and suggest that one quantum of transmitter activates about 1500 elementary conductance channels. (8 refs.)

103841 Ventricular fibrillation and fluctuations in the magnitude of the repolarization vector. D.R.Adam, A.O.Powell, H.Gordon, R.J.Cohen (Div. of Health Sci. & Technol., Harvard-MIT, Cambridge, MA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.241-4
Susceptibility to ventricular fibrillation, as estimated by the measurement of the Ventricular Fibrillation Threshold (VFT), has been related to the degree of both the spatial inhomogeneity of the ventricular repolarization process and also the temporal, beat-to-beat variation in the pattern of ventricular repolarization. Specifically, as the VFT is reduced, the repolarization process is found to develop a periodic behavior, reflected in an alternans pattern of variation in T-wave morphology. The authors investigate whether this increase in temporal fluctuations is due solely to mechanical or electrical angular changes of the repolarization wavefront propagation or due to a more fundamental alteration in electrical conduction processes. The hypothesis was tested by investigating the effects of reducing the Ventricular Fibrillation Threshold (VFT), on both single lead surface electrocardiogram (ECG) and the magnitude of the instantaneous cardiac dipole as measured by vectorcardiography. Canine studies are performed. (6 refs.)

103842 The apparent repetition frequency of ventricular fibrillation. J.N.Herbschleb, I.van der Tweel, F.L.Meijler (Dept. of Cardiology, Univ. Hospital Utrecht, Utrecht, Netherlands).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.249-52
The auto power spectra of the recorded electrical activity of the heart during ventricular fibrillation (VF) strongly suggests that during VF action potentials occur at very regular time intervals. These intervals, however, are approximately twice as short as the shortest RR-intervals encountered in, e.g. sinus-rhythm during heavy exercise or ventricular tachycardia. A mathematical model of 1000 interconnected 'cells' showed a persistent repetitive activity, with the rate of the model as a whole two times higher than the individual components. An analysis of the individual states of all 1000 'cells' indicated that approximately 30% of the 'cells' were activated synchronously and regularly, another 30% behaved in the same way, but with a shift of half a period compared to the first group, thus causing the two times higher frequency of the whole. Data from literature and the authors' own observations disclose that fibrillation as a sequel to tachycardia may indeed contain a repetition frequency approximately twice the frequency of the tachycardia. 103843 **Objective measurement of sensory functions.** N.Sugie.
J. Soc. Instrum. & Control Eng. (Japan), vol.22, no.3, p.274-81 (March 1983). In Japanese.
For visual-acuity measurements there are three objective instrumentation methods: (1) the preferential looking (PL) method, which can be carried out with a simple apparatus; (2) the visually evoked potential (VEP) method, which requires a complicated apparatus for generating and controlling a stimulus pattern; and (3) the optokinetic nystagmus (OKN) method, which allows measurements to be made in a short time. Measuring the binocular stereopsis provides an effective method for finding strabismus in human infants. For this there is a method based on VEP. In addition, VEP can be used to measure opponent-colours response. Auditory function can be revealed by measuring brain stem potentials. (27 refs.) *K.B.*

103844 **On the relation between aniseikonia and axial anisometropia.** J.Rabin, A.Bradley, R.D.Freeman (School of Optometry, Univ. of California, Berkeley, CA, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.553-8 (July 1983).
A dichoptic, size-matching technique was used to evaluate aniseikonia in a sample of axial anisometropes. During testing, the subjects were optically corrected to minimize differences in retinal image size. A clinically significant degree of aniseikonia was measured which varied in proportion to the magnitude of anisometropia. These results may reflect interocular differences in the spatial density of the retinal elements secondary to anisometropic ocular growth. (11 refs.)

103845 **Zone of zero-associated phoria in patients with convergence insufficiency.** R.P.Rutstein (School of Optometry, Univ. of Alabama, Birmingham, AL, USA), L.B.Godio.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.582-5 (July 1983).
The zone of zero-associated phoria (ZZAP) was determined for patients with convergence insufficiency. The ZZAP for these patients differs from that of asymptomatic patients. It is concluded that the ZZAP may be used as a supplemental test to help the clinician detect convergence insufficiency and possibly other binocular deficiencies. (30 refs.)

103846 **New measures of fixation disparity in the diagnosis of binocular oculomotor deficiencies.** A.L.Duwaer (Dept. of Biological & Medical Phys., Erasmus Univ., Rotterdam, Netherlands).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.586-97 (July 1983).
Two new measures of fixation disparity have been successfully used to evaluate the occurrence of binocular oculomotor deficiencies under (normal) viewing conditions with no interposed prisms. They are the threshold for the perception of misalignment between briefly presented dichoptic nonius lines and the SD of this threshold. The effectiveness of these new measures of fixation disparity for diagnosing binocular oculomotor deficiencies, which are symptomatically manifested as asthenopia, was found to surpass the diagnostic effectiveness of two measures of fixation disparity in current use: the mean amount of fixation disparity at the point where there are no prisms before the eyes and the slope of the fixation disparity curve near this point. The high diagnostic effectiveness of the new measures of fixation disparity, which are related to the spread of the fixation disparity, suggests that the binocular oculomotor deficiency underlying asthenopia is in essence an inaccurate and unstable alignment of the two eyes. (18 refs.)

103847 **Two-dimensional structure of the receptive fields of the cat visual cortex.** V.D.Glezer, V.Ye.Gauzel'man, T.A.Schcherbach, V.M.Bondarko (Pavlov Inst. of Physiology, Acad. of Sci., Leningrad, USSR).
Biophysics (GB), vol.27, no.4, p.749-54 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.715-19 (1982).
Study of the responses of the neurones of the receptive fields of the cat visual cortex to sinusoidal gratings of different spatial frequency and orientation gave the two-dimensional space frequency characteristics. It is shown that the frequency optimal for the field does not change with orientation. Theoretical analysis of the role of the factor of the limited size of the field showed that tuning both in spatial frequency and orientation must be sufficiently wide. The results indicate that the receptive fields are grating filters of spatial frequencies. (16 refs.)

103848 **Developmental changes in the human visual system as reflected by the latency of the pattern reversal VEP.** A.Moskowitz, S.Sokol (Dept. of Ophthalmology, Tufts Univ. School of Medicine, Boston, MA, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.1-15 (July 1983).
Pattern reversal visually evoked potentials (VEPs) were recorded from 439 infants and young children ranging in age from 1 month to 5 years in response to large and small checks. Qualitative analysis of the VEP wave form showed that the first major positive component, P_1, is consistently present at all ages, while the frequency of occurrence of later positive components is more variable. The proportion of infants showing late positive components increases with age; by 1 year, the frequency of occurrence of late components for large checks is more adult-like than for small checks. The latency of P_1 was analyzed quantitatively. Results showed that P_1 latency decreases rapidly during the first year of life for both large and small checks and that the time course of the latency change differs as a function of check size. VEPs to large checks attain adult-like P_1 latency values by about 1 year of age, while the P_1 latency of VEPs to small checks has still not reached adult levels by 5 years of age. (58 refs.)

103849 **Perimetry, visual evoked potentials and visual evoked spectrum array in homonymous hemianopsia.** G.G.Celesia, J.T.Meredith, K.Pluff (Dept. of Neurology, Williams S. Middleton Memorial Veterans Hospital, Madison, WI, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.16-30 (July 1983).
Confrontation field examination, perimetry, visual evoked potentials (VEPs) to pattern hemi-field stimulation and visual evoked spectrum array to flash stimulation were compared in 50 patients with homonymous hemianopsia. The visual field could be examined by confrontation in all patients and the field defect was demonstrated in 96% of cases. Goldmann perimetry could only be performed in 60% of patients, but always quantitatively defined the margins of the defect. VEPs could only be tested in 77% of patients and demonstrated an abnormality in 79% of cases. VEPs were absent to stimulation of the affected hemifield in every case of homonymous field defects with macular splitting. Visual evoked spectrum array could be tested in 95% of patients and revealed abnormalities in 67% of cases. The relative value of each test is discussed. (39 refs.)

103850 **Visual evoked-response correlates of speechreading performance in normal-hearing adults: a replication and factor analytic extension.** V.J.Samar, D.G.Sims (Nat. Tech. Inst. for the Deaf, Rochester Inst. of Technol., Rochester, NY, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.2-9 (March 1983).
The relationship between the latency of the negative peak occurring at approximately 130 msec in the visual evoked-response (VER) and speechreading scores was investigated. A significant product-moment correlation of −.58 was obtained between the two measures, which confirmed the fundamental effect but was significantly weaker than that previously reported in the literature (−.90). Principal compenents analysis of the visual evoked-response waveforms revealed a previously undiscovered early VER component, statistically independent of the latency measure, which in combination with two other components predicted speechreading with a multiple correlation coefficient of .84. The potential significance of this new component for the study of individual differences in speechreading ability is discussed. (12 refs.)

103851 **Mutual coupling between the ocular circadian pacemakers of Bulla gouldiana.** M.H.Roberts, G.D.Block (Dept. of Biology, Univ. of Virginia, Charlottesville, VA, USA).
Science (USA), vol.221, no.4605, p.87-9 (1 July 1983).
The ocular circadian pacemakers of Bulla gouldiana were found to be mutually coupled, and their interaction could be observed in an isolated nervous system maintained in vitro. Experimentally induced phase separations between the two ocular pacemakers were reduced when the eyes were allowed to interact for 48 hours. The reduction in phase separation did not occur however when the cerebral commissure was severed, indicating that this neural tract is a critical pathway coupling these two circadian clocks. 103852 **Wavelength-dependent rod-cone transition of the electroretinographic response.** W.J.Donovan, W.S.Baron (SRI Internat., Menlo Park, CA, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.559-66 (July 1983).
Signal-averaging and vector voltmeter techniques have been used to measure the rod-cone response transition of the primate corneal electroretinogram (ERG). Lights of 580 nm or shorter wavelength, flickering sinusoidally at 5 Hz, produced nearly sinusoidal ERGs with a rod-type spectral sensitivity. For stimuli of 600 nm or longer wavelength, the ERG exhibited cone as well as rod response components; the ERG response became increasingly nonlinear and measurements of sensitivity and phase grew more variable. The results show how phase information may reveal changes in response nonlinearities. Response shape and vector voltmeter phase readings are more accurate indicators of the boundary between rod-only vs. rod-cone mixed responses than are vector voltmeter magnitude readings. Shifts in the rod-cone response boundary could perhaps be exploited clinically to test for some anomalous visual processes. (23 refs.)

103853 **Color of visual display terminals and the eye: green VDTs provide the optimal stimulus to accommodation.** J.G.Sivak, G.C.Woo (School of Optometry, Univ. of Waterloo, Waterloo, Ontario, Canada).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.640-2 (July 1983).
The longitudinal chromatic aberration of the human eye is substantial and therefore the color of the phosphor chosen for a visual display terminal

(VDT) will affect refractive state and accommodative demand. For most working distances, green stimuli (λ max 520nm) are optimal. (17 refs.)

103854 Chromatic valence and hue sensation. Y.Ejima (Dept. of Electrical Engng., Kyoto Inst. of Technol., Kyoto, Japan), S.Takahashi.
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1048-54 (Aug. 1983).
Red-green and yellow-blue chromaticnesses were scaled for various monochromatic lights by a just-noticeable-difference method. The just-noticeable difference of each chromaticness, i.e. redness, greenness, yellowness, or blueness, was defined by the change of the cancelling light intensity that was required to produce a just-noticeable difference in the amount of the opponent-hue attribute of each monochromatic light. The results showed that an approximately logarithmic transformation took place at the two opponent-colour coding systems and that there existed an interaction between red-green and yellow-blue opponent colour coding systems in such a manner that the effective contribution of one opponent-colour response to the perceived opponent-hue attribute was reduced by increasing the magnitude of the other opponent-colour response. This interaction is considered to be responsible for the well-known veiling effect. (15 refs.)

103855 Linearity law reexamined for flicker photometry by the summation-index method. M.Ikeda (Dept. of Information Processing, Tokyo Inst. of Technol. Graduate School, Yokohama, Japan).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1055-61 (Aug. 1983).
The summation-index technique was applied to flicker photometry to investigate the linearity law. Two test stimuli of different wavelengths were mixed, and the luminous efficiency of the mixture was measured under three different adapting conditions: no adaptation, 507-nm adaptation, and 650-nm adaptation. Most of the wavelength combinations and adapting conditions gave a summation index of 0.30, which is the linearity in the visual system that is responsible for the flicker perception, namely, the achromatic channel. An exception was the red and green combination under the no-adaptation condition, which gave a slightly smaller summation index than 0.30, indicating that these two stimuli do not add linearly. The subsummation was interpreted as cancellation of red and green responses in the red-versus-green opponent channel. The subsummation disappeared when the flicker frequency was increased from 5 to 12 Hz, confirming the interpretation. (21 refs.)

87.32S Psychophysics of vision, visual perception, binocular vision

103856 Border enhancement as a function of binocular fixation performance. A.Remole (School of Optometry, Univ. of Waterloo, Waterloo, Ontario, Canada).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.567-77 (July 1983).
Traditionally, fixation disparity is measured by interocular vertical alignment of unfusable monocular targets. The disparity generally increases with forced ocular vergences, producing characteristic individual functions. This study explores a new method of monitoring binocular fixation performance; the method is based on the effect of the distance of the border stimulus from the foveal center on the lateral spread of border enhancement. That is, as this distance increases, the enhancement spread increases. It is found that, as increasing ocular vergence is applied, the enhancement also increases, in a manner resembling conventional fixation disparity measurements. However, some dissimilarities between the border enhancement functions and the conventional functions suggest that the directional values used as a basis for the latter undergo modifications. (21 refs.)

103857 Application of two-dimensional Fourier transforms to problems of visual perception. F.L.Royer (Cleveland Veterans Administration Medical Center, Cleveland, OH, USA), M.S.Rzeszotarski, G.C.Gilmore.
Behav. Res. Methods & Instrum. (USA), vol.15, no.2, p.319-26 (April 1983). (12th National Conference on the Use of On-Line Computers in Psychology, Minneapolis, MN, USA, 1982).
Neurophysiological and psychophysical evidence indicates that the visual system performs a sort of Fourier analysis of retinal variations in brightness through multiple spatial frequency-tuned channels. Two types of applications of techniques of two-dimensional Fourier analysis are discussed: (1) modelling and simulation of visual functions, and (2) generation of stimuli in which the spatial frequency information is controlled. Examples of both these applications are presented. (22 refs.)

103858 Visual motion and cortical velocity. A.Johnston, M.J.Wright (Dept. of Psychology, Brunel Univ., Uxbridge, England).
Nature (GB), vol.304, no.5925, p.436-8 (4 Aug. 1983).
Visual acuity decreases with distance from the fovea in proportion to the estimated cortical magnification factor, M (the extend of striate cortex in millimetres corresponding to a degree of arc in visual space). The authors have used M-scaling to investigate motion perception as a visual field variable. They report that both the lower threshold of motion and adaption to motion are uniform for M-scaled stimuli, and are related to the velocity of the 'cortical image.'. (19 refs.)

103859 Statistical differences of reaction time in Schizophrenic and normal person groups to four modes of light stimulation. H.Miike, Y.Ebina (Faculty of Engng., Yamaguchi Univ., Ube, Japan), M.Momota.
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.377-84 (May 1983). In Japanese.
The reaction time to four light stimulus modes is statistically examined in normal and schizophrenic person groups. Two modes are presented at constant and random time intervals at a constant position. The other presentation methods are to use spatially constant (SC) and random (SR) positions at random time intervals. The difference in the two person groups is evaluated by the degree of overlap and level of significance of four statistics; average (AV), standard deviation (SD), median (ME) and shape factor of histogram (SF). Maximum differences are found in the SR mode and the discriminant functions ME and SF are most effective in discriminating between the two groups. (18 refs.)

87.34 AUDITION

103860 Perceptual prominence of harmonic components in vowel-like sounds. O.Kakusho, H.Nakashima, M.Yanagida, R.Mizoguchi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan), T.Kobayashi.
Acustica (Germany), vol.53, no.3, p.132-42 (July 1983).
The perceptual sensitivity of the human auditory system to the harmonic components in vowel-like sounds is investigated in order to identify dominant components in both natural and synthetic vowels. A new concept of the removal-detectable components (RDCs) in the spectrum of vowel-like sounds is introduced as a component whose removal is perceptually detectable in either phonological or tonal quality. The properties of RDCs are discussed on the $\Delta F_i - A_i$ plane, where ΔF_i and A_i denote the frequency difference between two adjacent local peaks and the area surrounded by the line connecting the peaks and the spectral envelope, respectively. In the preliminary investigation for the present research, it was confirmed that the mutual phase relation among the components plays little role in the removal-detectability experiment. The RDCs in synthetic vowels are identified through paired comparison test by two male subjects. The distribution diagram of RDCs on a modified $\Delta F_i - A_i'$ plane enables one to distinguish the formant peaks from spurious ones on irregular short-time frequency spectra of natural vowels. The correct identification rate of peak components due to formants for five Japanese vowels was found to be more than 98% for over 1000 frames of short-time frequency spectra of natural vowels uttered by seven male adults and was found to be perfect for time-averaged frequency spectra of the same vowels. (7 refs.)

103861 Vowel identification and dichotic fusion of time-varying synthetic speech sounds. H.Kuwabara (NHK Broadcasting Sci. Res. Labs., Tokyo, Japan).
Acustica (Germany), vol.53, no.3, p.143-51 (July 1983).
Two kinds of perceptual experiments were performed for synthetic unsteady vowels. The synthetic stimuli were symmetric three-vowel sequences of the forms [uVu] and [eVe]. The first experiment was conducted to investigate the perceptual phoneme-boundary for the middle vowels of [uVu] stimuli, and a large amount of boundary shift in comparison with the boundary of the steady-state counterparts was found to occur. The second experiment was designed to find out the possible location within the auditory nerve system of the inner mechanism that gives the boundary-shift, making use of a dichotic fusion paradigm. The result shows that the mechanism is not located in the peripheral system, but is more likely a process of the central brain function. (13 refs.)

103862 Note on a non-linear model of the basilar membrane. C.H.Loh (Dept. of Theoretical & Appl. Mech., Univ. of Auckland, Auckland, New Zealand).
Acustica (Germany), vol.53, no.3, p.159-62 (July 1983).
The present analysis yields a simple procedure for finding the non-linear response of the basilar membrane. The required calculations are minimal and are more economical than direct numerical techniques. The chief disadvantage is the fact that the approximations used are asymptotic and thus not fully exact. Although the analysis has been restricted to a pure-tone stimulus, the perturbation method can be extended to include multi-tonal stimuli. The various primaries would then interact to produce harmonics and intermodulation components. (13 refs.)

103863 Brain stem auditory, pattern-reversal visual, and short-latency somatosensory evoked potentials: latencies in relation to age, sex, and brain and body size. T.Allison, C.C.Wood, W.R.Goff (Neuropsychology Lab., Veterans Administration Medical Center, West Haven, CT, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.619-36 (June 1983).
To determine standards of normality for auditory, somatosensory and visual evoked potentials commonly used in the assessment of neurological disease, 8 auditory evoked potential, 1 visual evoked potential (VEP) and 12 somatosensory evoked potential components were recorded to stimulation of left and right ears, eyes, and median nerves in 286 normal subjects ranging in age from 4 to 95 years. Peak and interpeak latencies, and left-right differences in latency, were analyzed as function of age, sex, and estimates of brain and body size. Major features of the results were: (1) Peak latencies of all components showed statistically significant increases in latency with age except for VEP P100. (2) In adults the peak latencies of all components were significantly later in males than in females. (3) Most interpeak latencies showed significant differences in relation to age or sex. (4) Age and sex are useful predictors of latency for nearly all peak and interpeak latencies. (5) Left-right latency differences showed little age-related, and no sex-related change. (42 refs.)

103864 Variations in early and late event-related components of the auditory evoked potential with task difficulty. D.S.Goodin, K.C.Squires, A.Starr (Dept. of Neurology, Univ. of California, Irvine, CA, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.680-6 (June 1983).
A variation in the difficulty of an auditory discrimination was used to investigate the relationship between the event-related P_{165}, N_2 and P_3 components of the auditory evoked potential. Equivalent increases in the latencies of all 3 components were found with increased task difficulty. The P_{165} component, however, could be differentiated from the two later components since it increased in amplitude with increased task demands while the N_2 and P_3 amplitudes remained constant. It is suggested that the P_{165}, N_2 and P_3 components comprise a functional sequence in the processing of rare events and possibly involved in a subject's preparations for the future. (24 refs.)

103865 Effect of contralateral and ipsilateral masking of acoustic stimulation on the latencies of auditory evoked potentials from cochlea and brain stem. E.H.J.F.Boezeman (Dept. of Clinical Neurophysiology, Valeriuskliniek & Academic Hospital, Free University, Amsterdam, Netherlands), T.S.Kapteyn, S.L.Visser, A.M.Snel.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.710-13 (June 1983).
Masking techniques were applied to a group of 10 subjects with normal hearing to investigate the influence of masking on the latencies of brain stem auditory evoked potentials. The levels of sufficient masking and overmasking were determined. Central masking, as established in a psychophysiological manner, cannot be clearly demonstrated by auditory brain stem evoked potentials. When masking the untested ear, the alterations in the response are small and this can be ignored in clinical practice if masking of the untested ear is necessary. (20 refs.)

103866 Auditory nerve-brain stem evoked potentials and EEG during severe hypoglycemia. E.Deutsch (Dept. of Ear, Nose & Throat, Bikur Cholim Hospital, Jerusalem, Israel), H.Sohmer, J.Weidenfeld, S.Zelig, I.Chowers.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.714-16 (June 1983).
To investigate the effects of severe hypoglycemia on the ability of the brain to generate electrical activity, the EEG and auditory nerve-brain stem evoked potentials (ABP) were recorded before and during the development of insulin-induced hypoglycemia in rats (ABP only) and cats (ABP and EEG). No significant ABP changes were seen in rats in which the average blood glucose levels had reached 0.38 mmol/l (=7 mg%). In cats, even though the EEG was depressed, no ABP latency changes and only slightly significant amplitude changes were seen in animals in which the average blood glucose level was 0.8 mmol/l. In both animals blood glucose levels were below 1.66 mmol/l for an average duration of 90 min. Therefore, even though it has been shown that the brain structures involved in generation of the ABP have higher metabolic rates, they seem to be resistant to deviations from homeostasis such as hypoglycemia. (9 refs.)

103867 Wave I of early auditory evoked potentials in multiple sclerosis. H.C.Hopf, K.Maurer (Dept. of Clinical Neurology, Johannes Gutenberg Univ., Mainz, Germany).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.31-7 (July 1983).
Early auditory evoked potentials (EAEPs) were recorded in a series of 71 consecutively examined patients suffering from clinical definite or probable multiple sclerosis (MS). Wave I abnormalities, i.e. delayed latency, with or without reduced amplitude, were observed in 15 such patients and were interpreted as due to MS in 8 of them. As EAEP wave I is identical with the potential N1 in electrocochleography and corresponds to activity of the most distal part of the acoustic nerve or the spiral ganglion, it is concluded that the peripheral part of the acoustic nerve is involved in about 10% of MS patients. In two cases normalization of initially delayed wave I latencies were demonstrated during follow-up recording. The pattern of a late wave I but normal hearing in 3 patients is interpreted in terms of a desynchronized compound nerve activity with fully preserved conductivity, segmental demyelination of a considerable number of acoustic nerve fibres being the most likely cause. (45 refs.)

103868 Far-field cochlear microphonics in man and their relation to cochlear integrity. M.Euler, J.Kiessling (Phys. Technol., Univ. Duisburg, Duisburg, Germany).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.86-9 (July 1983).
Far-field cochlear microphonics (CM) in man have been measured as a function of frequency by phase-sensitive detection. CM amplitude, dispersion and input-output functions vary periodically with frequency and exhibit certain frequency windows, where responses are approximately frequency specific, in contrast to the commonly accepted model of basal turn CM generators as main sources. Pathological cochleae show abnormal amplitude and phase functions. The results offer new diagnostic possibilities, because hair cell function can be evaluated by a routine non-invasive procedure down to the low frequency speech range. (11 refs.)

103869 Discrimination of speech processed by low-pass filtering and pitch-invariant frequency lowering. C.M.Reed, B.L.Hicks, L.D.Braida, N.I.Durlach (MIT, Cambridge, MA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.409-19 (Aug. 1983).
Consonant discriminability by normal-hearing listeners was studied for monosyllables processed using frequency lowering with either uniform (linear) or nonuniform (warped) compression of the frequency axis. The bandwidth of the compressed signal was either 2500 or 1250 Hz and five compression characteristics were studied, in addition to low-pass filtering, for each of the two bandwidths. Stimuli were 24 consonant-vowel syllables made up of 24 consonants and three vowels, recorded three times by each of two male and female speakers. A 'roving-speaker, roving-vowel, roving-utterance', two-interval, forced-choiced procedure with feedback was employed. As expected, performance for the 2500-Hz bandwidth was superior to that for the 1250-Hz bandwidth. For each bandwidth, compression schemes which accomplished greater lowering of the high frequencies relative to the low frequencies resulted in the highest performance. Overall performance for the best frquency-lowering system studied, however, was roughly comparable to that obtained for low-pass filtering. Patterns of performance over articulatory features were different for frequency lowering and filtering. In general, lowering was superior to filtering for contrasts for fricative sounds but inferior for contrasts of nasals and semivowels. (23 refs.)

103870 Coarticulation in sequences of two nonhomorganic stop consonants: perceptual and acoustic evidence. B.H.Repp (Haskins Labs., New Haven, CT, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.420-7 (Aug. 1983).
This study investigated whether any perceptually useful coarticulatory information is carried by the release burst of the first of two successive, nonhomorganic stop consonants. The CV portions of natural VCCV utterances were replaced with matched synthetic stimuli from a continuum spanning the three places of stop articulation. There was a sizable effect of coarticulatory cues in the natural-speech portion on the perception of the second stop consonant. Moreover, when the natural VC portions including the final release burst were presented in isolation, listeners were significantly better than chance at guessing the identity of the following, 'missing' syllable-initial stop. The hypothesis that the release burst of a syllable-final stop contains significant coarticulatory information about the place of articulation of a following, nonhomorganic stop was further confirmed in acoustic analyses which revealed significant effects of CV context on the spectral properties of the release bursts. The relationship between acoustic stimulus properties and listeners' perceptual responses was not straightforward, however. (12 refs.)

103871 Intense sounds may alter the mechanical properties of the cochlear partition. D.McFadden (Dept. of Psychology, Univ. of Texas, Austin, TX, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.447-55 (Aug. 1983).
Morphological and structural changes have been observed in various cochlear elements following exposure to intense sounds. Whether these changes are sufficient to locally alter the mechanical properties of the cochlear partition is unknown. Here a psychophysical test for mechanical changes in the partition is developed and applied. Monaural exposures to an intense 1700-Hz tone were preceded and followed by a binaural task in which the subject adjusted the interaural time difference of a 250-Hz tone in order to perceive it as centered inside his head. If the local gradients of mass, stiffness, and/or coupling were altered by the exposure, then the post-exposure settings should contain a time lead toward one ear or the other, depending upon the direction of the mechanical changes. Following exposure to an intense tone, the maximum temporary threshold shift (TTS) is often displaced upward in frequency from the exposure stimulus—an effect widely known as the half-octave shift in TTS. Time leads toward the nonexposed ear in the post-exposure centering task would be in accord with a mechanical-change explanation of the half-octave shift. Settings in this direction were observed with the most intense and longest durations of exposure used, but with less intense or shorter exposures, the post-exposure settings were initially toward the exposed ear. Thus, the psychophysical evidence reported here supports the idea that exposure to intense sounds does produce temporary, local changes in cochlear mechanics, but if fails to provide a simple confirmation of the possibility that these mechanical changes underlie the half-octave shift in TTS. (39 refs.)

103872 Effects of auditory fatigue on speech intelligibility and lexical decision in noise. C.Sorin, C.Thouin-Daniel (CNET, Lannion, France).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.456-66 (Aug. 1983).
The influence of weak auditory fatigue on speech identification and lexical decision (word/nonword) was studied. It appears that, at a low listening level and in presence of a strong masking noise, auditory fatigue gives rise to: (1) a decrease in identification scores, (2) more frequent confusions for fricatives, (3) a reduction in correct lexical decision scores, (4) an increase in the tendency to respond 'word' more often than 'nonword', (5) a slight increase in reaction times for incorrectly repeated items. The intelligibility impairment can be attributed to a combination of masking and fatigue effects. Errors in lexical decisions and changes in response times are explained by an adaptation of the lexical decision processes to the degraded perceptual representation of the stimuli. There is no clear evidence in this experiment that a very central component of auditory fatigue influences lexical decisions. (40 refs.)

103873 Gap detection as a function of frequency, bandwidth, and level. M.J.Shailer, B.C.J.Moore (Dept. of Experimental Psychology, Univ. of Cambridge, Cambridge, England).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.467-73 (Aug. 1983).
The threshold for detection of a temporal gap in a noiseband was measured. A notched noise masker was used to restrict listening to a limited spectral region. Threshold was measured as a function of center frequency, bandwidth, and level. For a signal bandwidth of one-half the center frequency, the gap threshold decreased from 22.5 ms for a center frequency of 0.2 kHz to 3.2 ms at 8.0 kHz: a wideband condition provided an estimate of 2.3 ms, a value in agreement with previously published estimates. Bandwidth manipulation showed that the variation with frequency was not due to changes in absolute bandwidth alone. The effect of changes in level was determined at three frequencies, 0.4, 1.0, and 6.5 kHz, using a signal bandwidth of half the center frequency. At all frequencies gap threshold decreased as the signal spectrum level was raised from 10 to 25 dB, but a further increase to 40 dB showed no additional improvement. At frequencies up to about 1.0 kHz, the variation of gap threshold with frequency matches well the reciprocal of the bandwidth of the auditory filter, as determined from masking experiments using a notched-noise masker. This suggests that the temporal response of the auditory filter may limit gap detection at low frequencies. (26 refs.)

103874 Effects of perilymph viscosity on low-frequency intracochlear pressures and the cochlear input impedance of the cat. S.Koshigoe, Wai-Kwong Kwok, A.Tubis (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.486-92 (Aug. 1983).
Cochlear model calculations are shown to be in reasonable agreement with recent low-frequency measurements of intracochlear pressures and the cochlear input impedance of the cat [V. Nedzelnitsky, ibid., vol.68, p.1676-1689 (1980); T.J. Lynch, III, V. Nedzelnitsky, and W.T. Peake, ibid., vol.72, p.108-130 (1982)]. Included in the cochlear model are perilymph viscosity, the measured variation of the area of the scala vestibuli with distance from the stapes [P. Dallos, ibid., vol.48, p.489-499 (1970)], and finite impedance of the round window membrane. The WKB approximation and its extension to the low-frequency region is used in order to exhibit explicitly the dependence of the model results on the cochlear parameters. (35 refs.)

103875 The transmission of signals by auditory-nerve fiber discharge patterns. D.H.Johnson, Ananthram Swami (Dept. of Electrical Engng., Rice Univ., Houston, TX, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.493-501 (Aug. 1983).
Recent developments in the theory of point processes are used to analyze the accuracy by which signals are conveyed by the discharges of single auditory-nerve fibers. It is shown that the only spike trains which can convey a signal without distortion are those well-described by a Poisson process model. Theoretical predictions are made of the distortion present in the transmission of signals by auditory-nerve fiber discharge patterns. Absolute refractory effects are shown to result in more distortion than relative refractory ones. Procedures are developed to compensate for these distortions. The procedures designed to compensate for absolute refractory effects operate on the PST histogram. Computer simulations are used to confirm the theoretical predictions and to assess the accuracy of the compensation techniques. (23 refs.)

103876 Representation of stop consonants in the discharge patterns of auditory-nerve fibers. M.I.Miller, M.B.Sachs (Dept. of Biomedical Engng., Johns Hopkins Univ. School of Medicine, Baltimore, MD, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.504-17 (Aug. 1983).
The representation of the speech syllables /da/ and /ba/ in populations of auditory-nerve fibers was studied. Post-stimulus-time histograms were computed from 20-ms segments of fiber spike trains occurring in response to the stimulus. Discrete Fourier transforms with a resolution of 50 Hz were computed from each histogram. As a measure of the response of the population of fibers to each harmonic of the 50-Hz resolution frequency of the transform, the magnitude of the response to that frequency was averaged across all fibers whose characteristic frequencies were within one-fourth octave of that harmonic. The authors have previously called this measure the average localized synchronized rate (ALSR). Response profiles for the 20-ms segments of the stimulus was generated by plotting the ALSR versus frequency. Time-varying spectral features of the /da/ and /ba/ stimuli are well preserved by such profiles. For example, the onset spectrum and formant transition of the consonant-vowel syllable are well represented. Furthermore, the fine structure in the speech spectrum related to the pitch of the excitation source is maintained in these ALSR plots. Average discharge rate profiles were generated in a manner similar to that for the ALSR; in this case average rate replaces Fourier transform components as response measure. Such average rate profiles can represent the transitions of at least formants two and three. However, such average rate profiles do not represent the steady-state formants or the voice pitch. (43 refs.)

103877 Dichotic listening performance, language impairment, and lesion location in aphasic listeners. N.Niccum, A.B.Rubens, O.A.Selnes (Hennepin County Medical Center, Minneapolis, MN, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.42-9 (March 1983).
This investigation sought to identify relations between dichotic listening performance and both specific language functions and CT scan evidence of lesion location in order to determine whether the nature of these relations would support either 'dominance effect' or 'lesion effect' interpretations of the dichotic scores. Twenty-five aphasic patients completed the authors' digit dichotic listening test, the Boston Diagnostic Aphasia Examination (BDAE),

an experimental sentence comprehension test, and a digit immediate memory span test. Right ear scores (and the ear advantage) accurately reflected the integrity of the central auditory structures for all but one of the patients, and thus were interpreted as 'lesion effects.' These same right ear scores also were related more strongly to performance on phrase repetition subtests of the BDAE and to scores obtained on the authors' sentence comprehension test than to the other language measures analyzed. These relations were maintained even when general measures of auditory comprehension and immediate memory were held constant through the use of partial correlations. Both 'dominance' and 'lesion' effect interpretations were discussed, but the 'lesion effect' interpretation more adequately characterized the data. That is, the integrity of the posterior, superior temporal area seemed to be essential for perception of right ear stimuli on the digit dichotic test and for accurate performance on specific language tests. (20 refs.)

103878 Threshold inaccuracies in an elderly clinical population: ear canal collapse as a possible cause. L.J.Randolph, R.L.Schow (Idaho State Univ., Pocatello, ID, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.54-8 (March 1983).
In a sample of 80 persons in the 60-79-year age range, threshold shifts suggestive of collapsible ear canals were found in over one third of the subjects. A very conservative interpretation of the data suggests that at least 10-16% of these 60-79-year old elderly subjects have collapsible ear canals. Neither sex nor age was related significantly to prevalence. Results of this study indicate that in testing elderly persons there are threshold inaccuracies, relating possibly to collapsible ear canals, which, if not taken into account, may cause unacceptably large errors in both clinical and research applications. (21 refs.)

103879 The determination of tinnitus loudness considering the effects of recruitment. R.S.Tyler (Univ. of Iowa, Iowa City, IA, USA), D.Conrad-Armes.
J. Speech & Hear. Res. (USA), vol.26, no.1, p.59-72 (March 1983).
Reports an attempt to determine a meaningful measure of tinnitus loudness that considers loudness recruitment. Sixteen subjects with sensorineural tinnitus adjusted the level of a pure tone so that it was (a) at threshold, (b) equal in loudness to the tinnitus, and (c) uncomfortably loud. The pure-tone frequency was (a) at the frequency of the tinnitus pitch, and (b) at the octave frequency between 500 and 4000 Hz having the pure-tone threshold closest to 0 dB HL. In addition, the subjects adjusted the level of a broadband noise so that it (a) was at threshold, (b) just masked the tinnitus, and (c) was uncomfortably loud. These measurements were performed both in the ear ipsilateral and in the ear contralateral to the tinnitus. Formulae based on abnormal loudness functions and uncomfortable loudness levels are presented that convert equal-loudness matches in dB sensation level (SL) into loudness in sones. The level of broadband noise (in dB SL) required to mask tinnitus was about the same in the ipsilateral and in the contralateral ear for most of the subjects, regardless of the ear in which the tinnitus was localized. This noise level (in dB SL) required to mask the tinnitus correlated well with the level (in dB SL) of a tone at the most normal frequency judged equal in loudness to the tinnitus. (55 refs.)

103880 The annoyance of tinnitus and the noise required to mask it. M.J.Penner (Univ. of Maryland, College Park, MD, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.73-6 (March 1983).
For 11 patients with tinnitus and sensorineural hearing loss, the intensity of bilateral broad-band noise required to mask the tinnitus increased by as much as 41 dB over a 30-minute period. A significant correlation was obtained between the rate of change in the noise over time and reported annoyance of the tinnitus as measured on a 5-point rating scale. The total change in the noise level and the initial noise level required to mask the tinnitus were not significantly correlated with the annoyance of the tinnitus. (13 refs.)

103881 Audiologic correlates of hearing handicap in the elderly. B.E.Weinstein, I.M.Ventry (Teachers Coll., Columbia Univ., New York, NY, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.148-51 (March 1983).
This investigation was conducted to determine the relationship between self-assessed hearing handicap and audiometric measures in a large sample of noninstitutionalized elderly individuals. Eighty subjects underwent a complete audiological evaluation and responded to the Hearing Measurement Scale (HMS). Each of the correlations between measures of sensitivity and the HMS score was statistically significant. The speech discrimination scores showed a somewhat lower correlation with the HMS score than did pure-tone measures. The implications of these findings are discussed. (9 refs.)

103882 Iris pigmentation and AC thresholds. A.F.Roche, D.Mukherjee, Wm.C.Chumlea, R.M.Siervogel (Fels Res. Inst., Wright State Univ., Yellow Springs, OH, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.151-4 (March 1983).
Data from 160 white children were used to analyze possible associations between iris pigmentation and AC pure-tone thresholds. Iris pigmentation was graded from iris color using glass models of eyes, and AC thresholds were obtained under carefully controlled conditions. Analyses of variance using two groupings of iris color grades showed no evidence of an association between iris color grade and AC thresholds. Furthermore, inspection of arrays of the actual glass eye models, in conjunction with the order of mean thresholds at each test frequency, did not indicate the presence of an association between iris color grades and thresholds. It was conducted that while iris pigmentation may be related to some aspects of hearing ability, it does not appear to be related to AC thresholds in children. (23 refs.)

103883 Three models of temporal summation evaluated using normal-hearing and hearing-impaired subjects. G.M.Gerken, A.D.Gunnarson, C.M.Allen (Callier Center for Communication Disorders, Univ. of Texas, Dallas, TX, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.256-62 (June 1983).
Temporal summation effects were measured in normal-hearing and hearing-impaired subjects using stimuli of different durations and temporal patterns. Threshold decreased with increasing stimulus duration for either single- or multiple-burst stimuli, but the hearing-impaired group showed smaller threshold shifts, which differed from those obtained with the normal-hearing group at the .0001 level of significance. Three models of temporal summation were evaluated: One model employed a time constant in an exponential function, one used a power function characterized by an exponent, and the last combined the properties of the exponential and power functions and was also characterized by an exponent. Estimates of the parameters that best described the data were obtained for each model. Data from the hearing-impaired subjects provided the most critical test of the models. The power function model and the combined model were both satisfactory with the range of stimulus durations used, but the exponential model failed to describe the data from the hearing-impaired subjects. It is suggested that there may not be a decrease in the time constant for temporal summation for subjects with sensorineural hearing-loss, but that a factor related to the utilization of sensory input is altered. (24 refs.)

103884 Variability in matches to subjective tinnitus. M.J.Penner (Univ. of Maryland, College Park, MD, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.263-7 (June 1983).
For patients with noise-induced sensorineural hearing loss the results of matching a binaurally presented comparison tone to subjective tinnitus during a 20-day test period are reported. As a control, results of matching an external comparison tone to a standard tone are also presented. The variability for tinnitus measurements was extremely large relative to comparable measures for objective stimuli. The relevance of this finding to the nature of tinnitus and to the construction of tinnitus maskers is discussed. (20 refs.)

103885 Physiological evidence for central modulation of voice tremor. G.F.Inbar, G.Eden (Dept. of Electrical Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Biol. Cybern. (Germany), vol.47, no.1, p.1-12 (1983).
This paper presents an attempt to define the physiological parameter used to describe 'voice tremor' in psychological stress evaluating machines, and to find its sources. This parameter was found to be a low frequency (5-20 Hz) random process which frequency modulates the vocal cord waveform and (independently) affects the frequency range of the third speech formant. The frequency variations in unstressed speakers were found to be the result of forced muscular undulations driven by central nervous signals and not of a passive resonant phenomenon. In this paper various physiological and clinical experiments which lead to the above conclusions are discussed. (17 refs.)

103886 Formant frequencies, bandwidths, and Qs in helium speech. E.O.Belcher (Appl. Phys. Lab., Univ. of Washington, Seattle, WA, USA), S.Hatlestad.
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.428-32 (Aug. 1983).
Uses linear prediction analysis to estimate a diver's vocal tract response for isolated vowels spoken in air at 1 atm and in heliox at simulated depths of 54-, 120-, 300-, and 500-m seawater. The authors specifically measured formant frequency, bandwidth, and Q changes as a function of environment. The formant frequencies shifted upward nonlinearity in helium speech. The formant bandwidths in helium speech increased as much as 14 times their corresponding bandwidths in normal speech. The ratios of formant Qs (helium speech to normal speech) ranges from 0.3 (low formants) to 2 (high formants). (12 refs.)

103887 Effects of physiological aging on selected acoustic characteristics of voice. L.A.Ramig (Univ. of Colorado, Boulder, CO, USA), R.L.Ringel.
J. Speech & Hear. Res. (USA), vol.26, no.1, p.22-30 (March 1983).
The relationship between age-related changes in body physiology and certain acoustic characteristics of voice was studied in a sample of 48 men representing three chronological age groupings (25-35, 45-55, and 65-75) and two levels of physical condition (good and poor). A fundamental frequency analysis program (SEARP) was used to measure mean fundamental frequency, jitter, shimmer, and phonation range from samples of connected speech and sustained vowel production. Subjects in good physical condition produced maximum duration vowel phonation with significantly less jitter and shimmer and had larger phonation ranges than did subjects of similar chronological ages who were in poor physical condition. These differences were most apparent in the productions of the elderly subjects. While chronological aging is undoubtedly a contributor to such changes in the acoustic characteristics of voice, these results suggest that age-related changes in body physiology, or physiological aging, also must be considered. (47 refs.)

103888 Contextual effects in the measurement of hearing-impaired speakers' intelligibility. R.W.Sitler, N.Schiavetti (State Univ. of New York, Geneseo, NY, USA), D.E.Metz.
J. Speech & Hear. Res. (USA), vol.26, no.1, p.30-5 (March 1983).
Previous research has indicated that hearing-impaired speakers' intelligibility scores are better when sentences are used than when word lists are used as speech materials in word indentification tests. The speech intelligibility of 20 hearing-impaired speakers was measured with word indentification tests using isolated words (W-22 monosyllables) and words in sentence context (CID sentences). Analysis of individual speakers' intelligibility data revealed that sentence intelligibility scores were higher than word intelligibility scores only for the better speakers and that no differences were apparent between sentence and single-word intelligibility for the poorer speakers. These findings agree with the results of research with normal speech degraded in intelligibility by noise or filtering and indicate that an interaction may exist between context and overall intelligibility in which only speech that has a certain degree of overall intelligibility may show further intelligibility improvement with increased contextual clues. (23 refs.)

103889 A cinefluorographic investigation of repeated fluent productations of stutterers in an adaption procedure. G.N.Zimmerman (Univ. of Iowa, Iowa City, IA, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.35-42 (March 1983).
Cinefluorography was used to study three stutterers and two nonstutterers repeating a passage made up of monosyllables. CVC target words of the form /caet/ were embedded in the passage and were analyzed to determine the effects of repeating the passage on velocities, displacements, and durations of movements of the tongue, jaw, and lower lip. Coordination among the articulators was also assessed. The investigation was undertaken to test the hypothesis that decreases in velocities and displacements, increased movement durations, and decreased latency between the onsets of jaw movements and of tongue tip movements would be associated with the repeated readings. The hypothesis was not supported by the results. A post hoc analysis showed that a decrease in the variability of instantaneous velocities (and by inference a

decrease in variation in muscle stiffness) was associated with practice for the three stutterers but not for the nonstutterers. Inferences about the adaptation effect are made related (a) to the stabilization of tonic muscle activity which may be associated with a decrease in arousal, and (b) to the effects of practice. (26 refs.)

103890 The influence of stress, position, and utterance length on the pressure characteristics of English /p/ and /b/. J.E.Flege (Univ. of Florida, Gainesville, FL, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.111-18 (March 1983).
This study examines pressure characteristics of /p/ and/b/ as a function of position with regard to stress and position within the utterance. Eight female talkers produced utterances which varied in length from one to five disyllables ([pape] or [babe]). Results demonstrate the importance of utterance position for the magnitude of supraglottal pressure in stops. Except in voiceless stops found in the first words of utterances, pressure was greater in the prestressed than in the poststressed position. The pressure difference distinguishing /p/ and /b/ was reduced considerably when these stops occurred in absolute utterance-initial position. A post hoc analysis revealed that pressured increased much more slowly in initial than in noninitial stops and that /p/ and /b/ were not distinguished by the rate at which supraglottal pressure increased when these stops occurred in utterance-initial position. Finally, it was found that the pressure of stops in the first words of utterances increased as a function of utterance length, suggesting preplanning for sentence production at the respiratory level. (34 refs.)

103891 A 3-year longitudinal study of school-aged children's fundamental frequencies. S.Bennett (Univ. of Maryland, College Park, MD, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.137-42 (March 1983).
Describes the longitudinal changes that took place in the average fundamental frequencies (f_0) of 25 boys and girls over a 3-year period ($\bar{x}$ age range=8:2-11:2). Results showed that developmental changes in the central tendency of f_0 can be detected over a 1-year period. For the group, the amount of decrease per 12-month interval averaged about 12 Hz, with a standard deviation of about 8 Hz. Cross-sectional observations of 7-11-year-old children's fundamental frequency characteristics do not reflect accurately the development course of f_0, in large part because the between-subject standard deviations are larger than the age-related changes that occur in children's voices at this stage of development. (22 refs.)

103892 Perception of intonational contrasts in alaryngeal speech. J.Gandour, B.Weinberg (Purdue Univ., West Lafayette, IN, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.142-8 (March 1983).
The achievement of intonational contrasts by 4 normal and 16 laryngectomized speakers was assessed. The laryngectomized subjects represented four clinical subgroups of alaryngeal speech: esophageal, tracheoesophageal, Western Electric #5 electrolarynx, and Servox electrolarynx. High-quality tape recordings of each subject's productions of two pairs of sentences (Bev loves Bob) spoken in statement and question form were presented to 40 listeners for evaluation using a two-interval-alternative-forced-choice procedure. Intonational contrasts were achieved in a highly effective manner by the normal, esophageal, and tracheoesophageal speakers. In contrast, users of electronic artificial larynges were generally unable to achieve these intonational distinctions except for one user of the Western Electric #5 electrolarynx Western Electric no.5 electrolarynx;. (21 refs.)

103893 Linguistic processing and reaction time differences in stutterers and nonstutterers. C.R.Hand, W.O.Haynes (Auburn Univ., Auburn, AL, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.181-5 (June 1983).
Linguistic processing by the left and right cerebral hemispheres was investigated in 10 adult male stutterers and 10 matched nonstutterers. Subjects performed a lexical decision task in which nonword and real-word stimuli were presented tachistoscopically to the right and left visual hemifields. Vocal and manual reaction times to real words were measured to assess hemispheric participation in processing linguistic information and to determine differences between response modes. The stuttering group exhibited a left visual field efficiency or right hemisphere preference for this task and were slower in both vocal and manual reaction times. Ramifications for hemispheric processing theories and laryngeal dysfunction hypotheses are discussed. (30 refs.)

103894 Airflow characteristics of fricative consonants produced by normally hearing and hearing-impaired speakers. R.L.Whitehead, S.M.Barefoot (Nat. Tech. Inst. for the Deaf, Rochester Inst. of Technol., Rochester, NY, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.185-94 (June 1983).
The rates of airflow were investigated for fricative consonants produced by normally hearing speakers and by hearing-impaired speakers who varied in degree of hearing loss and speech intelligibility. Subjects consisted of 20 normally hearing adults (10 men and 10 women), 20 moderately-to-severely hearing-impaired adults with intelligible speech (10 men and 10 women), and 20 profoundly hearing-impaired adults with semi-intelligible speech (10 men and 10 women). Average airflow rates were obtained for the fricatives /s/, /z/, /f/, and /v/ in CV and VCV syllables. In general, it was found that normally hearing, intelligible hearing-impaired, and some semi-intelligible hearing-impaired speakers produced voiceless fricatives with substantially greater airflow rates than they produced voiced cognates. The data also revealed that both male and female semi-intelligible hearing-impaired speakers produced fricatives in the CV context with greater amounts of airflow and fricatives in the VCV environment with less airflow than did the normally hearing and intelligible hearing-impaired speakers. Further, the male and female semi-intelligible hearing-impaired speakers failed to demonstrate the trend, as exhibited by the other speakers, for lingua-alveolar fricatives to be produced with greater air flow than the labiodental fricatives. The data from this investigation provide additional evidence to support the assumption that some hearing-impaired speakers fail to control and coordinate the biomechanical aspects of speech properly. (31 refs.)

103895 Airflow characteristics of stop-plosive consonant productions of normal-speaking children. R.W.Trullinger (VA Medical Center, Augusta, GA, USA), F.W.Emanuel.
J. Speech & Hear. Res. (USA), vol.26, no.2, p.202-8 (June 1983).
This study of children's speech was designed to investigate peak oral-nasal airflow during the production of stop-plosive consonants in isolated syllable contexts. The subjects were 30 normal-speaking children: five girls and five boys at each of three age levels (8, 9, and 10 years). Each subject produced each of six stop-plosive consonants (/p/, /b/, /t/, /d/, /k/, and /g/) in each of three syllable contexts (CV, VCV, and VC) with each of two vowels (/i/ and /a/). A pneumotachometer and an oscillographic recorder were used to obtain permanent airflow records of the test syllables. It was found that the peak flows varied according to the age of subjects, consonant voicing, place of consonant production, consonant position within the test syllable, and the vowel in combination with the test consonant. Results were compared to related findings previously obtained for children and adults. (19 refs.)

103896 The effects of varying lower-lip displacement on upper-lip movements: implications for the coordination of speech movements. J.W.Folkins, R.N.Linville (Univ. of Iowa, Iowa City, IA, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.209-17 (June 1983).
Upper-lip and lower-lip movements were transduced in the inferior-superior dimension in five normal-speaking subjects during four tasks. In task 1 visual feedback was used to manipulate the maximum displacement of the lower lip during speech. The upper lip elevated significantly less for the opening gesture when the amount of opening from the lower lip was increased. The upper lip moved to significantly lower positions for bilabial closure when the distance to be moved by the lower lip was increased. In task 2 the same procedures were followed with a bite block between the teeth. The bite block did not significantly change the interactions between lips for the opening gesture. The interactions were larger for bilabial closure with the bite block. In task 3 different vowels instead of visual feedback were used to manipulate lower-lip displacement. The relations between lips were similar to those found in task 1. In task 4 it was shown that these relations between lips are not found in nonspeech lower-lip movements. The interactions between lips are discussed in relation to models of speech motor control, including spatial targets, mass-spring systems, and planned trajectories. (33 refs.)

103897 'Compensatory articulation' under conditions of reduced afferent information: a dynamic formulation. J.A.S.Kelso (Haskins Labs., New Haven, CT, USA), B.Tuller.
J. Speech & Hear. Res. (USA), vol.26, no.2, p.217-24 (June 1983).
A well-established feature of speech production is that talkers, faced with either anticipated or unanticipated perturbations, can spontaneously adjust the movement patterns of articulators such that the acoustic output remains relatively undistorted. Less clear is the nature of the underlying processes involved. The authors examined five subjects' productions of the point vowels /i, a, u/ in isolation and of the same vowels embedded in a dynamic speech context under normal conditions and under a combined condition, in which (a) the mandible was fixed by means of a bite block; (b) proprioceptive information was reduced through bilateral anesthetization of the temporomandibular joint; (c) tactile information from the oral mucosa was reduced by application of a topical anesthetic; and (d) auditory information was masked by white noise. Minimal distortion of the formant patterns was found in the combined condition. These findings are unfavourable for central (e.g. predictive simulation) or peripheral closed-loop models, both of which require reliable peripheral information; they are more in line with recent work suggesting that movement goals may be achieved by muscle collectives that behave in a way that is qualitatively similar to a nonlinear vibratory system. (45 refs.)

103898 Spectrographic analysis of vowel and word duration in apraxia of speech. M.Collins, J.C.Rosenbek (Wm. S. Middleton Memorial VA Hospital, Madison, WI, USA), R.T.Wertz.
J. Speech & Hear. Res. (USA), vol.26, no.2, p.224-40 (June 1983).
Most normal speakers of English reduce the duration of the stem word vowel as words increase in length. Theoretically, this durational reduction reflects low-level linguistic knowledge. The authors posed two questions in this study: First, do speakers with apraxia of speech progressively reduce vowel durations as words increase in length, and, second, do these vowel and word durations differ significantly from normal productions? The authors asked 11 apraxia of speech patients and 11 normal speakers to repeat three sets of three words which progressively increased in length, and they analyzed these productions spectrographically. The results revealed that both groups reduced vowel duration as words increased in length. Word and vowel duration for apraxia of speech patients, however, were often significantly longer than those for normal speakers. The results suggest that vowel reduction is a robust phenomenon which resists impairment in apraxia of speech, despite often significant disturbances in motor programming. (22 refs.)

103899 Acoustic patterns of apraxia of speech. R.D.Kent (Boys Town Inst., Omaha, NE, USA), J.C.Rosenbek.
J. Speech & Hear. Res. (USA), vol.26, no.2, p.231-48 (June 1983).
Apraxia of speech (or verbal apraxia) is a controversial disorder, considered by some to be an impairment of the motor programming of speech. Because the disorder is characterized by 'higher order' errors such as metathesis and segment addition as well as by errors of apparent dyscoordination of articulation, it seems to reflect a relatively high level of damage to the nervous system. This report presents acoustic descriptions of the speech of seven persons diagnosed as having apraxia of speech but without severe aphasic impairment, especially agrammatism. The acoustic results indicate a variety of segmental and prosodic abnormalities, including slow speaking rate with prolongations of transitions, steady states, and intersyllable pauses; reduced intensity variation across syllables; slow and inaccurate movements of the articulators; incoordination of voicing with other articulations; initiation difficulties; and errors of selection or sequencing of segments. These error patterns are discussed with respect to a theory of motor control based on spatial-temporal schemata. In addition, consideration is given to the controversy about phonologic versus motor programming impairment in apraxia of speech. (53 refs.)

103900 Perceptual organization of speech sounds by infants. J.Hillenbrand (Northwestern Univ., Evanston, IL, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.268-81 (June 1983).
An operant head-turn procedure was used to test whether 6-month-old infants recognize the auditory similarity of speech sounds sharing a value on a phonetic-feature dimension. One group of infants was reinforced for head turns when a change occurred from a series of repeating background stimuli containing nasal consonants ([m, n, η]) to repetitions from a category of syllables containing voiced stop consonants ([b, d, g]), or to a change from stops to nasals. The stimuli were naturally produced by both male and female talkers. The performance of infants in this 'phonetic' group was compared to that of infants in a 'nonphonetic' control group. Using the same procedures, these infants were reinforced for head turns to a group of phonetically unrelated speech sounds. Results indicated that the performance of infants in the group trained on phonetically related speech sounds was far superior to that of infants in the nonphonetic control group. These findings suggest that prelinguistic infants can perceptually organize speech sounds on the basis of auditory properties related to feature similarity. (36 refs.)

103901 Phonological correlates of middle-ear involvement in speech-delayed children: a methodological note. L.D.Shriberg, A.J.Smith (Univ. of Wisconsin-Madison, Madison, WI, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.293-7 (June 1983).
The purpose of this note is to illustrate the potential contribution of phonological analysis to the study of the origins of developmental phonological disorders (delayed speech). Speech samples from two clinical populations of children with delayed speech were inspected. Within each group, children were subdivided on the basis of case records data on their histories of middle-ear involvement. In both clinical samples, children with positive histories of middle-ear involvement had statistically higher frequencies of occurrence of two sound change categories. Several analyses of one of the sound change cate-

gories were undertaken to determine whether these errors could be related to current deficits in underlying forms, to phonetic output constraints, or to perceptual-acoustic characteristics of the sounds involved. (18 refs.)

103902 Formant frequency fluctuation as an index of motor steadiness in the vocal tract. B.R.Gerratt (VA Medical Center, West Los Angeles, CA, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.297-304 (June 1983).
Involuntary movement of the articulatory structures can interfere with the accurate placement of the articulators during consonant production and may also result in distortion of vowel quality. An acoustic method was used to assess motor steadiness in the vocal tract musculature superior to the glottis during vowel production by five subjects with abnormal involuntary orofacial movements associated with tardive dyskinesia and 10 normal subjects. A linear predictive coding technique of spectral analysis yielded formant frequencies from the sustained productions of /a/. Based on the premise that changes in vocal tract configuration can be measured as changes in formant frequency, the sequential segment-to-segment fluctuations of the second formant frequency of these vowel samples were computed and used as an index of motor steadiness. Results showed that formant frequency fluctuation measures for four of the five tardive dyskinetic patients were substantially larger than those of the normal subjects, indicating a reduction of motor steadiness in these four subjects. Factors influencing the validity of this procedure and implications for its use are discussed. (16 refs.)

87.38 MECHANO- AND CHEMIO-CEPTIONS

(inc. biosonic generation, detection and guidance)

103903 Behavior of a single neuron in a recurrent excitatory loop. O.Diez Martinez, J.P.Segundo (Dept. of Anatomy & Brain Res. Inst., Univ. of California, Los Angeles, CA, USA).
Biol. Cybern. (Germany), vol.47, no.1, p.33-41 (1983).
This paper examines the practical possibility and the consequences of recurrent excitation, or positive feedback, on the impulse discharge of a single nerve cell. The latter was the neuron in the slowly-adapting crustacean stretch-receptor organ: each of its action potentials triggered an excitatory sensory stimulus via an external artificial electronic circuit. (27 refs.)

103904 Origins of short latency somatosensory evoked potentials to median nerve stimulation. T.Nakanishi, M.Tamaki, Y.Ozaki, K.Arasaki (Dept. of Neurology, Univ. of Tsukuba, Ibaraki-Ken, Japan).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.74-85 (July 1983).
Short latency SEPs recorded in hand-scalp, ear-scalp and upper neck-scalp leads with stimulation of the median nerve were examined in 27 normal subjects and in 11 selected patients with unilateral complete loss of position sense in order to provide information concerning the generator sources of these potentials. Evidences obtained from both normal subjects and patients suggest the following origins for these short latency SEPs. In hand reference recording, P_1 may arise in the brachial plexus just beneath the clavicle, P_2 in the cervical dorsal column, P_3 mainly in the caudal brain stem, and P_4 primarily in the brain stem lemniscal pathways and partly in the thalamus. The initial negative potential recorded in upper neck-scalp leads may originate largely in the cervical dorsal columns. The early positive potential recorded in ear-scalp leads may reflect activity mainly in the brain stem lemniscal pathways and partly in the thalamus. The initial negative component of the cortical SEPs (N1) may arise in the thalamus, and the subsequent positive component (P1) may reflect activity in the primary somatosensory cortex. (26 refs.)

103905 Vibrotactile forward masking: evidence for channel independence. G.A.Gescheider, M.J.O'Malley (Dept. of Psychology, Hamilton Coll., Clinton, NY, USA), R.T.Verrillo.
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.474-85 (Aug. 1983).
Threshold shifts for the decision of vibrotactile test stimuli were determined as a function of the intensity of a masker. A 50-ms sinusoidal test stimulus was applied to the thenar eminence of the hand 25 ms after the termination of a 700-ms sinusoidal masker applied to the same site. The intensity of the masker was varied over a range of 0-44 dB SL. The frequency of the masker was either 15 or 250 Hz and the frequency of the test stimulus was either 15, 25, 100 or 250 Hz. The results support the hypothesis that the detection of vibrotactile stimuli is mediated by at least two receptor systems which do not mask each other. (33 refs.)

103906 Regenerative impulses in taste cells. S.Roper (Dept. of Anatomy & Physiology, Univ. of Colorado Medical School, Denver, CO, USA).
Science (USA), vol.220, no.4603, p.1311-12 (17 June 1983).
Taste cells and nongustatory epithelial cells in the isolated lingual mucosa from the mud puppy Necturus maculosus were impaled with microelectrodes. The taste cells, but not surrounding epithelial cells, were electrically excitable when directly stimulated with current passed through the recording electrode. Action potentials produced by taste cells had both a sodium and a calcium component. (17 refs.)

103907 Reversible loss of gravitropic sensitivity in maize roots after tip application of calcium chelators. J.S.Lee, T.J.Mulkey, M.L.Evans (Dept. of Botany, Ohio State Univ., Columbus, OH, USA).
Science (USA), vol.220, no.4604, p.1375-6 (24 June 1983).
The application of calcium chelating agents (EDTA or EGTA) to the tips of maize roots caused a loss of gravitropic sensitivity. When the chelator was replaced with calcium chloride, gravitropic sensitivity was restored. Asymmetric application of calcium chloride near the tip of a vertical root caused curvature toward the calcium source. When the calcium was applied to the upper surface of the tip of a root oriented horizontally, the root curved upward even though control roots exhibited strong downward curvature. Application of calcium chloride to the tips of decapped roots, which are known to be gravitropically insensitive, did not restore gravitropic sensitivity. However, asymmetric application of calcium chloride near the tips of decapped roots caused curvature toward the calcium source. Calcium may play a key role in linking gravity detection to gravitropic curvature in roots. (14 refs.)

(inc. magnetocardiography)

103908 Possible adaptation to strong magnetic fields. Z.N.Nakhilnitskaya, L.D.Klimovskaya, Z.F.Kuzmina, V.N.Mastryukova, N.P.Smirnova, A.D.Strzhizhovsky, G.V.Cherkasov (Inst. of Biomedical Problems, Min. of Health, Moscow, USSR).
Acta Astronaut. (GB), vol.10, no.3, p.159-61 (March 1983).
Animal adaptation to a strong magnetic field was investigated. Mice were exposed to 30-day total-body continuous effects of a constant magnetic field (CMF) of 1.6 T, and their physiological responses were assessed. Analysis of the data obtained showed that different parameters varied in a dissimilar manner. Red blood changes returned to normal in the course of the experiment. Leucocytosis and increased content of catecholamines and corticosterone of blood and adrenals persisted throughout the exposure. Changes in the spermatogenic epithelium were most distinct after the exposure. The recovery of certain parameters during the CMF exposures is indicative of adaptation of some physiological systems. The adaptation is, however, incomplete as suggested by the long persisting stress manifestation. Reticulocytopenia and spermatogenetic abnormalities found after the exposure are of particular importance. (5 refs.)

103909 Demonstration of useful differences between magnetoencephalogram and electroencephalogram. D.Cohen, B.N.Cuffin (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.38-51 (July 1983).
An experimental comparison is made between MEG and EEG maps due to a neural source which appears to behave as a dipole (N20 of the somatic evoked response). The same three differences as predicted theoretically are seen, therefore the predicted differences are confirmed experimentally. The first two differences, due only to the tangential component of the dipole, are that the MEG pattern is rotated by 90° from the EEG pattern and is one-third tighter. The first allows the MEG to localize a tangential dipole better in a preferred direction, across the dipole (while the EEG does so along the dipole); the second allows the MEG to localize somewhat better in its preferred direction than the EEG does in its preferred direction. The third difference is due only to the radial component of the dipole; while the MEG receives no contribution from this component, the EEG pattern is asymmetrical and is heavily weighted by it. This allows the MEG to reveal tangential sources which are obscured by the radial sources in the EEG. (20 refs.)

87.45 BIOMECHANICS, BIORHEOLOGY, BIOLOGICAL FLUID DYNAMICS

103910 Effect of the time of the day on left ventricular systole and diastole dynamics. K.Markiewicz, M.Cholewa, J.Bechler (First Dept. of Internal Diseases, Inst. of Internal Medicine, Military School of Medicine, Lodz, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.5-6, p.551-8 (Sept.-Dec. 1982).
Synchronous recording of ECG from the second lead, phonocardiograph from the Erb's point and right carotid sphygmogram was performed in 20 healthy men aged 20 to 25 years four times during a 24-hour period: at 9 am, at 4 pm, at 2 am after awakening, and at 2 am during all-night activity. The polycardiograms obtained were analysed by the method of Weissler calculating the measured and corrected left ventricular contraction periods. An increase was observed in the dependence of the diastole time (D), total electromechanical contraction time (QS_2) and the left ventricular ejection time (LVET) on the heart rate in the night hours. Moreover, the functional reserve of the heart increased during the night as demonstrated by prolongation of the D time and decrease of QS_2 in the heart cycle (R-R). It was found also

that during the night hours the LVET and QS_2 values and the pre-ejection period were significantly greater independently of the degree of activity than in the morning and afternoon ($p<0.05$). (20 refs.)

103911 Elasticity of the foot on modelling human movements. A.V.Zinkovskii, V.A.Chistyakov (Lenigrad Polytech. Inst., Leningrad, USSR).
Biophysics (GB), vol.27, no.4, p.745-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.711-14 (1982).
An anthropomorphic model is designed taking into account the elasticity of the foot in human movements. The foot in the model is represented in the form of an elastic rod. The computer-synthesized movements of the model are in good imitation of human movements in performing a jump. (9 refs.)

103912 Regulation of human balance on a small bearing surface. Ye.T.Petrenko (Kazakh Inst. of Phys. Culture, Alma Ata, USSR).
Biophysics (GB), vol.27, no.4, p.772-4 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.734-5 (1982).
The investigation reported was on 15 gymnasts, Masters of Sport. The subjects maintained their balance by standing on one leg of the full foot (bearing surface 170-190 cm^2) and on tiptoes (bearing surface 28-32 cm^2). During exercises the author recorded stabilograms, micro-displacements of the centre of gravity (CG) of the body, electrogoniograms of the angular displacements in the ankle and knee joints and electromyograms (EMG) of the muscles of the shin of the support leg. The results indicate intensification of the processes of regulation of balance in extremal conditions. It may be assumed that the agreement of the peaks of the maximum of the frequency spectra of the fluctuations in CG, the goniograms and the EMGs reflects the processes of co-tuning of the system of execution to the optimal frequency of regulation. The maintenance of balance on tiptoe is possible only as a result of previous prolonged training. This indicates the prime importance of the central mechanisms of the control system in maintaining stability on small bearing surfaces. (4 refs.)

103913 Determination of femoral head containment during gait. G.T.Rab (Dept. of Orthopaedic Surgery, University of California, Davis, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.31-8 (1983).
Using three-dimensional gait data, a mathematical model of the proximal femur was developed that will predict the loading conditions in the child's hip joint during walking. The model is based on knowledge of rim coordinates of the acetabulum, and consists of rotating unit vectors eminating from the center of the epiphysis. The results will be used in a variety of three-dimensional stress analyses of the femoral head in Legg-Perthes disease (a disorder of femoral head collapse). (4 refs.)

103914 Discrimination of systolic blood pressure. L.J.Vidergar (Wayne State Univ., Detroit, MI, USA), R.M.Lee, M.S.Goldman.
Biofeedback & Self-Regul. (USA), vol.8, no.1, p.45-61 (March 1983).
The ability of humans to discriminate systolic blood pressure (BP) was investigated in two experiments. In Experiment 1, 14 normal subjects were asked to make estimates of their systolic BP while performing both BP-elevating and BP-lowering tasks. They were given intermittent feedback throughout all 10 45-min sessions. Results indicated significant correlations and small absolute differences between estimated and measured BP for all subjects in almost all sessions. Experiment 2, undertaken 6 months after Experiment 1, assessed whether estimation accuracy by subjects who had available both external and interoceptive cues surpassed that of subjects which access to external cues only. Three subjects from the original group who showed consistently high motivation, and who improved in accuracy across the 10 sessions in the previous experiment, made estimates of BP while performing novel tasks with no feedback. Correlations between estimated and measured BP remained high for 2 of the 3. (15 refs.)

103915 Reduction of blood pressure by indirect biofeedback. J.R.Erbeck, L.F.Elfner, D.F.Driggs (Florida State Univ., Tallahasse, FL, USA).
Biofeedback & Self-Regul. (USA), vol.8, no.1, p.63-72 (March 1983).
Forty-five randomly assigned subjects served in either a relaxation control, an EMG plus thermal, or a thermal biofeedback group. All groups received the same relaxation manipulation. Experimental results demonstrated a significant drop in both diastolic and systolic blood pressure for the feedback treatment. Diastolic measures showed a somewhat greater decrease for the EMG plus thermal treatment condition. A learning effect was demonstrated both within and across the three experimental sessions. Given that the sample was normotensive, the 20% reduction in blood pressure was notable. The results support the idea that blood pressure biofeedback is not a necessary condition for reduction of arterial blood pressure. (12 refs.)

103916 Mechanical properties of banana fibres (Musa sepientum). A.G.Kulkarni, K.G.Satyanarayana, P.K.Rohatgi (Regional Res. Lab., CSIR, Kerala, India), K.Vijayan.
J. Mater. Sci. (GB), vol.18, no.8, p.2290-6 (Aug. 1983).
The stress-strain curve for banana fibre is determined. Properties such as the initial modulus (YM), ultimate tensile strength (UTS) and percentage elongation are evaluated as a function of fibre diameter, test length and speed of testing. It is found that YM, UTS and % elongation show little variation in their values for fibres of diameter ranging from 50 to 250 μm. The UTS and breaking strain are found to decrease with an increase in the test length while both breaking strength and breaking strain remain constant with the increase of speed of testing from 0.5 to 100×10^{-3} m and thereafter they both decrease. These observed properties are explained on the basis of the internal structure of the fibre, namely, the number of cells, spiral angle and the number of defects. Scanning electron microscopic (SEM) studies of the frcatured surfaces of these fibres indiacte that the failure is due to pull-out of microfibrils accompanied by tearing of cell walls; the tendency for fibre pull-out seems to decrease with increasing speed of testing. (15 refs.)

103917 The dynamic mechanical properties of human skin in vivo. R.O.Potts, D.A.Chrisman,Jr., E.M.Buras,Jr. (Gillette Res. Inst., Rockville, MD, USA).
J. Biomech. (GB), vol.16, no.6, p.365-72 (1983).
The propagation and attenuation of shear waves in human skin is investigated over a frequency range of near zero to 1000 Hz. The results show that at frequencies below a few hundred Hz, shear waves propagate along the skin surface and thus provide information on the dynamic mechanical properties of the stratum corneum. The surface waves, however, are rapidly attenuated with increasing frequency so that at frequencies above about 500 Hz the energy is propagated only as bulk shear waves. Thus, at high frequencies the properties measured are those of the dermis. (10 refs.)

103918 In vitro contact stress distributions in the natural human hip. T.D.Brown, D.T.Shaw (Dept. of Orthopaedic Surgery, Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Biomech. (GB), vol.16, no.6, p.373-84 (1983).
Time variant distributions of intra-articular contact stress were assembled from direct measurement in seventeen grossly normal fresh cadaveric hips. Local stresses were sensed by arrays of 24 compliant miniature transducers inset superficially in the femoral head cartilage. Local contact stress magnitude was usually found to rise nearly linearly with applied joint loads in excess of about 1000 N. The sites of maximum local stress were found to underlie the general region of the acetabular dome. For a resultant joint load of 2700 N, the spatial mean contact stress and peak local contact stress averaged 2.92 MN m^{-2} and 8.80 MN m^{-2}, respectively, for the 68 loading cycles analysed. The full contact stress patterns were irregular and complex, but most commonly the general feature was a central band or 'ridge' of pressure elevation, oriented in an approximately anterior-to-posterior direction. (32 refs.)

103919 A survey of finite element analysis in orthopedic biomechanics: the first decade. R.Huiskes (Lab. for Experimental Orthopedics, Univ. of Nijmegen, Nijmegen, Netherlands), E.Y.S.Chao.
J. Biomech. (GB), vol.16, no.6, p.385-409 (1983).
The finite element method (FEM), an advanced computer technique of structural stress analysis developed in engineering mechanics, was introduced to orthopedic biomechanics in 1972 to evaluate stresses in human bones. Since then, this method has been applied with increasing frequency for stress analyses of bones and bone-prosthesis structures, fracture fixation devices and various kinds of tissues other than bone. The aims of these investigations were to asses relationships between load carrying functions and morphology of the tissues, and to optimize designs and fixation techniques of implants. Although the amounts of significant findings and useful concepts generated by the FEM during the first decade of its application in this field were limited, many publications have served to illustrate its capabilities and limitations. The method is now well established as a tool for basic research and for design analysis in orthopedic biomechanics, and the number of publications in which it is used is increasing rapidly. In the meantime, following developments in engineering mechanics, the capabilities of the method are augmented which, together with an increasing sophistication of computers, guarantees exciting possibilities for the future. (12 refs.)

103920 Quantification of intersegmental reactions during rapid swing motion. S.J.Phillips (Dept. of Phys. Education, Univ. of Maryland, College Park, MD, USA), E.M.Roberts, T.C.Huang.
J. Biomech. (GB), vol.16, no.6, p.411-17 (1983).
A simple mathematical model was developed to quantify the nonmuscular reactions between two adjacent segments undergoing rapid free-segment motion. Newtonian equations of motion were used to simulate the trajectories of the two segments using the input parameters of linear acceleration and muscular moment acting only about the proximal end of the proximal link. The intersegmental muscular force and moment were mathematically considered to be zero, and no constraints were placed on the motion of the two segments. The motion of the thigh and shank during the swing phase of running was simulated by the model and compared to the real motion obtained from cinematographic records. The simulation demonstrated that proximal thigh motion has a significant effect on the distal shank motion. Depending on the initial conditions, intersegmental reactions alone can produce large increases in distal segment speed. The role of the knee musculature in preventing these reactions during the swing phase of running was inferred. (12 refs.)

103921 Tendon excursion and moment arm of index finger muscles. K.N.An, Y.Ueba, E.Y.Chao, W.P.Cooney, R.L.Linscheid (Dept. of Orthopedics, Mayo Clinic/Mayo Foundation, Rochester, MN, USA).
J. Biomech. (GB), vol.16, no.6, p.419-25 (1983).
Tendon excursions during rotation of individual index finger joints were recorded continuously throughout the joints' ranges of motion. Both intrinsic and extrinsic muscles were studied during flexion-extension and abduction-adduction functions. Excursions and joint-displacement relationships were observed to not always be linear. Moment arms of tendons with respect to joint centers were further derived from excursion data. The significance of this information to tendon transfer techniques is discussed. These data are also important for theoretical modeling in muscle force determination. (12 refs.)

103922 Mechanical analysis of the human pelvis and its application to the artificial hip joint—by means of the three dimensional finite element method. H.Oonishi (Dept. of Orthopedic Surgery & Artificial Joint Section, Osaka-Minami Nat. Hospital, Osaka, Japan), H.Isha, T.Hasegawa.
J. Biomech. (GB), vol.16, no.6, p.427-44 (1983).
Mechanical analysis of the human pelvis and the hip joint was performed by means of a three-dimensional finite element method by the ASKA program. Two models each standing on one leg were made, one was the pelvis with the physiological hip joint, in the other pelvis part of the cartilage and subchondral bone was replaced with Al_2O_3 ceramic materials. In this study, the authors obtained; (1) the various deformations and displacements of the whole pelvis, the pelvic ring and the acetabulum and (2) the principal stress, the maximum shear stress and the Von Mises stress on the surface of the whole pelvis and in various horizontal sections of the whole pelvis. (7 refs.)

103923 Mathematical modeling of the stress strain-strain rate behavior of bone using the Ramberg-Osgood equation. T.K.Hight (Dept. of Mech. Engng. & Materials Sci., Duke Univ., Durham, NC, USA), J.F.Brandeau.
J. Biomech. (GB), vol.16, no.6, p.445-50 (1983).
The Ramberg-Osgood equation is used to model the viscoplastic properties of compact bone. Because of the exponential nature of this equation a special optimization technique is used for curve fitting. Results are presented for the application of this equation to three sets of strain rate dependent stress-strain curves from the literature. Good to very good curve fits are achieved. This technique holds promise both as a relatively simple means of quantifying the viscoplastic nature of compact bone response and also as a mechanism for mathematically modeling that behavior. (11 refs.)

103924 Peristaltic transport of a solid bolus. A.Bertuzzi (Istituto di Analisi dei Sistemi ed Informatica, CNR, Roma, Italy), S.Salinari, R.Mancinelli, M.Pescatori.
J. Biomech. (GB), vol.16, no.7, p.459-64 (1983).
An analysis of the peristaltic propulsion of a solid spherical bolus enclosed in a contractile membrane is presented. The model is based on in vitro preparations of intestinal segments, and utilizes a simplified representation of the mechanical properties of the muscular coats of the wall. The sequence of deformed configurations of the membrane and the displacement of the bolus are obtained by numerical solution of the model equations. The analysis presented in this paper could be useful for other studies in biomechanics (e.g. uterine contraction and motion of red blood cells in narrow capillaries). (18 refs.)

103925 The influence of superficial tissue on response of the primate knee to traumatic posterior tibial drawer. R.C.Haut (Biomedical Sci. Dept., General Motors Res. Labs., Warren, MI, USA).
J. Biomech. (GB), vol.16, no.7, p.465-72 (1983).
The posterior cruciate ligament is the primary restraint against large posterior displacement of the tibia in the isolated knee joint. However, muscle tone and superificial tissue may contribute to stability of the knee at traumatic levels of posterior tibial drawer. The influence of these parameters on joint resis-

tance was studied for the knee flexed at 90°. Experiments were conducted on an anesthetized primate with resting and tensed extensor muscles. Experiments were also conducted on postmortem and isolated knee joints. The experiments show that anteriorly-oriented superficial tissue contributes significantly to the stiffness and strength of the knee. Contraction of extensor muscles can increase the strength of the flexed knee by more than 50%. In posterior drawer, data from the isolated knee joint provides a lower bound on the actual strength of the living knee. (8 refs.)

103926 Effect of pressurization on methylmethacrylate-bone interdigitation: an in vitro study of canine femora. M.M.Panjabi, V.K.Goel, H.Drinker, J.Wong, G.Kamire, S.D.Walter (Section of Orthopaedic Surgery, Yale Medical School, New Haven, CT, USA).
J. Biomech. (GB), vol.16, no.7, p.473-80 (1983).
Aseptic mechanical loosening of the femoral and acetabular components is a major long term complication of total hip arthroplasty. Pressurized injection of bone cement (polymethylmethacrylate) has been advocated for increasing cement-bone interlock. To determine the relationship between cement intrusion pressure and its penetration into cancellous bone, an in-vitro study of paired, fresh frozen canine femora was conducted. Methacrylate cement was injected at predefined constant pressures from 0.11 to 1.23 MPa (16-175 psi). The penetration was quantified for each injection pressure. The results showed a positive logarithmic relationship between the relative penetration and the intrusion pressure, the former reaching a near asymptotic value at approximately 0.70 MPa (100 psi). Unequal radial distribution of cement within the metaphysis was demonstrated. Greater penetration was observed into the proximal postero-lateral cancellous bone bed as compared to other regions. The relationship between cement penetration and bone size was explored at a single constant pressure of 0.35 MPa (50 psi). Although absolute cement penetration was found to be linearly related to the bone size, the relative penetration remained nearly constant with bone size. (19 refs.)

103927 Stress wave propagation in bone. R.R.Pelker (Section of Orthopaedic Surgery, Yale Univ. School of Medicine, New Haven, CT, USA), S.Saha.
J. Biomech. (GB), vol.16, no.7, p.481-9 (1983).
The traveling wave characteristics for a single compressive pulse were studied in fresh and embalmed human long bones. The stress wave was generated by the longitudinal impact of a steel ball on one end of a bone and was monitored by bonded strain gages. The dynamic properties, namely velocity, attenuation coefficient and dispersion were correlated with the mineral density, porosity, and cross-sectional area of the specimens. Statistically significant relationships were found between several of these parameters. These stress wave propagation characteristics are important for one's understanding of the dynamic loading of bone and they may also provide a basis for the development of noninvasive techniques for studies of diseased or fractured bone. (49 refs.)

103928 Strain measurement in the medial collateral ligament of the human knee: an autopsy study. S.Arms, J.Boyle, R.Johnson, M.Pope (Dept. of Orthopaedics & Rehabilitation, Univ. of Vermont, Burlington, VT, USA).
J. Biomech. (GB), vol.16, no.7, p.491-6 (1983).
A strain transducer was developed which employs a magnetic field sensing device to detect linear displacement. The transducer was attached to the medial collateral ligament (MCL) of human autopsy specimens, minimally influencing their physiologic behavior. A strain 'map' of the MCL as a function of knee flexion (full extension to 120°) both with and without abduction force was obtained. The investigation revealed consistent differences in the strain patterns between proximal, middle and distal segments of the anterior and posterior borders of the MCL. Anatomic variations in the pattern of collagen fibers within the MCL, interactions between posterior oblique capsular fibers and the MCL, and the skeletal configuration may account for these varied strain patterns. (13 refs.)

103929 Balancing a force on the fingertip of a two-dimensional finger model without intrinsic muscles. C.W.Spoor (Dept. of Anatomy & Embryology, Univ. of Leiden, Leiden, Netherlands).
J. Biomech. (GB), vol.16, no.7, p.497-504 (1983).
A slightly flexed human middle finger can balance an external force on the fingertip. Internal stabilization is also possible, which means that the externally unloaded finger can be kept stiff. The authors analyse whether in these situations the intrinsic hand muscles are needed. Distances from tendons to flexion axes, taken from the literature, are substituted in the moment equilibrium equations of a two-dimensional finger model. Diagrams illustrate the statically indeterminate problem of solving tendon forces. The possibilites for equilibrium without intrinsics appear to depend mainly on four tendon-to-joint distances. These distances determine to which of two groups a finger belongs: (1) one in which intrinsics are not necessary for internal stabilization nor for balancing a force on the fingertip in any direction in the sagittal plane; (2) one in which, without intrinsics, internal stabilization is impossible and only dorso-distally directed forces on the fingertip can be balanced. (11 refs.)

103930 Velocity measurements in steady flow through axisymmetric stenoses at moderate Reynolds number. S.A.Ahmed, D.P.Giddens (School of Aerospace Engng., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Biomech. (GB), vol.16, no.7, p.505-16 (1983).
The velocity field in the neighborhood of axisymmetric constrictions in rigid tubes was investigated using laser Doppler anemometry and flow visualization. Upstream flow conditions were steady; and Reynolds number were in the range 500-2000, values which are representative of the larger arteries in humans. Stenoses of 25, 50 and 75% area reduction were studied. Velocity profiles are presented in sufficient detail to allow comparison with computational biofluid dynamics models. Wall shear stresses were estimated from the near wall velocity gradient, and the nature of observed poststenotic flow disturbances is discussed. Results indicate that flow disturbances of discrete oscillation frequency may be more valuable than turbulence as an indicator of early stages of stenosis development. Additionally, despite the fact that poststenotic turbulence exists for the higher degrees of stenosis and Reynolds numbers, the resulting wall shear stresses are only three to four times greater than the Poiseuille value and are considerably less than the wall shear stress within the stenosis itself. (24 refs.)

103931 Changes in knee function associated with treadmill ambulation. G.M.Strathy, E.Y.Chao, R.K.Laughman (Dept. of Orthopedics, Mayo Clinic/Mayo Found., Rochester, MN, USA).
J. Biomech. (GB), vol.16, no.7, p.517-22 (1983).
A comparison of level walking, on a walkway and on a treadmill, was performed using ten normal subjects. Motion about the knee was measured using a triaxial electrogoniometer, and foot-floor contact patterns were recorded by means of four foot switches attached to the sole of each shoe. On the walkway, the data were collected with the subject moving at a comfortable walking speed. The treadmill was then set at the average velocity obtained on the walkway. Knee joint rotation in the coronal and transverse planes did not change significantly between the walkway and the treadmill. In the sagittal plane, significant differences were found for total motion ($p<0.01$), swing phase motion ($p<0.01$), knee position at heel strike ($p<0.05$), and maximum swing phase extension ($p<0.01$). A comparison of the foot-floor contact patterns between walkway and treadmill ambulation revealed reduced heel contact time, with an increase in toe contact while on the treadmill. It was concluded that sagittal plane knee kinematics during level treadmill walking differ significantly from level overground walking. (12 refs.)

103932 Calf muscle moment, work and efficiency in level walking; role of series elasticity. A.L.Hof, B.A.Geelen, J.Van den Berg (Lab. of Medical Phys., Univ. of Groningen, Bloemsingel, Netherlands).
J. Biomech. (GB), vol.16, no.7, p.523-37 (1983).
Moment and work of the human calf muscles in level walking were determined by means of an EMG to force processor, based on a muscle analogue (see Hof and Van den Berg, ibid., vol.14, p.7470-92, 1981). Nine subjects (four women, five men) walked on a level treadmill at speeds between 0.5 and 2.5 m s^{-1}, at their self-chosen pace and at a forced pace with steplengths between 0.3 and 1.1 m. The interaction between the contractile and the series elastic component in the muscle could be studied by means of the analogue. A great part of the work done on the muscle and of the positive work done by the contractile component are stored in the series elastic component. The stored energy is released at a high rate in push-off. This mechanism ideally requires a concerted contraction, i.e. a contraction in which the activation is matched to the load to the effect that the length of the contractile component remains constant. The muscle then behaves like a spring. Consequences are (a) only little of the negative work gets lost, (b) the length of the contractile component remains close to the optimum of the force-length relation, (c) the shortening speed of the contractile component is now in the range where the muscle works at a high efficiency, and (d) high power peaks can be delivered due to the 'catapult action'. (48 refs.)

103933 Stresses in the closed mitral valve: a model study. T.Arts, S.Meerbaum (Dept. of Medicine, Cedars Sinai Medical Center, Los Angeles, CA, USA), R.Reneman, E.Corday.
J. Biomech. (GB), vol.16, no.7, p.539-47 (1983).
The tensile force in the chordae tendineae was related to transvalvular pressure using a mathematical model of mechanics of the closed mitral valve. Circumferential stress as well as bending stress in the valve leaflets were neglected. Without precisely knowing the mechanical properties of the leaflet material, the geometry of the leaflets was estimated by applying Laplace's law, which relates leaflet stress to leaflet curvature. Independent of the shape of the mitral valve orifice, under all circumstances the tensile force in the chordae tendineae was calculated to be equal or greater than half the force exerted on the mitral valve orifice by the transvalvular pressure. (13 refs.)

103934 On the mechanical resonances of a human tibia in vitro. G.Van der Perre, P.Cornelissen (Biomech. & Biomaterials Section, Katholieke Univ. Leuven, Heverlee, Belgium).
J. Biomech. (GB), vol.16, no.7, p.549-52 (1983).
Some comments concerning basic vibration theory, experimental techniques and mathematical modelling are given in connection with a paper by R.J. Collier et al. (ibid., vol.15, p.545-53, 1982) in which the mechanical resonances of an in vitro human tibia were analyzed experimentally. (6 refs.)

103935 Interactive control of isolated heart experiments. J.A.van Alste, A.L.Schoute, S.R.Vaartjes, H.B.K.Boom (Twente Univ. of Technol., Enschede, Netherlands).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.255-8
Presents a study of the pressure generating properties of working isolated left ventricles of rabbit hearts including the dependence on time, ventricular volume and flow at any chosen moment. An experimental set-up is built of which the central part consists of a servomotor driven piston pump. This volume actuator is connected to the left ventricle via a cannula tied in the mitral orifice and is controlled by a small computer. This computer also controls the electrical stimulator, artificial valves, a pressure calibration circuit and the end diastolic pressure or end diastolic volume. The experimental protocol requires many repetitive functions, with adjustable interval times and magnitudes. A special language syntax has been developed for (i) experiment definition, (ii) experiment composition in advance, (iii) real-time control during the actual experiment and (iv) registration of the actual protocol parameters. The interactive control was realized using the special language and an interpreter as one of the parallel processes for the experimental control. (4 refs.)

87.50 BIOLOGICAL EFFECTS OF RADIATIONS

(inc. effects of fields)

103936 Response of human lymphocyte chromosomes to fractionated neutron irradiation in vitro. A.V.Sevan'kaev, V.A.Nasonova, G.I.Golovinova (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.332-6 (1983). In Russian.
A comparative study was made of the yield of chromosome aberrations in a human lymphocyte culture after a single and fractionated exposure to neutron radiation at the beginning of the G_1 phase and during the S phase of the mitotic cycle. It was shown that the degree of the chromosome affection in both phases does not depend upon the irradiation schedules. (19 refs.)

103937 Relative biological effectiveness of neutrons in conditions of mixed γ- and neutron-irradiation. L.N.Postnikov, A.G.Sverdlov, G.A.Lavrova, N.G.Nikanorova (B.P. Konstantinov Leningrad Inst. of Nuclear Phys., USSR Acad. of Sci., Gatchina, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.337-43 (1983). In Russian.
Experimental animals (mice and rats) were exposed to mixed γ/neutron radiation. Relative biological effectiveness of a neutron component ($RBE_n/_x$) was shown to decrease with decreasing share of neutrons in the combination. This is considered as a manifestation of nonadditivity of the effects of neutrons and sparsely ionizing radiation. (19 refs.)

103938 Influence of alternating magnetic field on the bactericidal effect of ionizing radiation. M.A.Tumanyan, I.I.Samoilenko (N.F. Gamaleya Sci. Res. Inst. of Epidemiology & Microbiology, USSR Acad. of Medical Sci., Moscow, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.415-19 (1983). In Russian.
A study was made of the effect of an alternating magnetic field (AMF) and ionizing radiation delivered separately or in a combination on microorganisms differing in radioresistance. The AMF (240 and 750 E) had no pronounced bactericidal action. A synergistic increase in the sterilizing effect of ionizing radiation was demonstrated after incubation of irradiated bacteria in the AMF. A radiation-magnetic technique is proposed for sterilization of preparations and articles made of nonthermoresistant materials which enables one to decrease by 1.5 times the bactericidal dose of ionizing radiation. (11 refs.)

103939 Micronucleus induction in Vicia faba roots. II. Biological effects of neutrons below 1 cGy. I.Marshall (Kernforschungszentrum Karlsruhe, Inst. fur Kernphys., Karlsruhe, Germany), M.Bianchi.
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.163-73 (Aug. 1983).
For pt.I see ibid., vol.44, no.2, p.151-62, 1983. A dose-effect relationship has been established for high-energy neutrons (maximum energy 600 MeV) within a dose range of 0.2 to 80 cGy and for low-energy neutrons produced by a ^{252}Cf source (mean energy 2.35 MeV) for doses between 0.2 and 5 cGy. The frequency of micronuclei was found to increase linearly with dose. The relative biological effectiveness values calculated using ^{60}Co radiation as a reference were, in the high-dose region, 4.7 ± 0.4 and 11.8 ± 1.3 for the high- and low-energy neutrons, respectively. At doses below 1 cGy constant values of 25.4 ± 4.4 and 63.7 ± 12 were reached for the respective neutron energies. (28 refs.)

103940 V79 survival following simultaneous or sequential irradiation by 15-MeV neutrons and ^{60}Co photons. P.D.Higgins, P.M.DeLuca,Jr., D.W.Pearson (Dept. of Medical Phys., Univ. of Wisconsin, Madison, WI, USA), M.N.Gould.
Radiat. Res. (USA), vol.95, no.1, p.45-56 (July 1983).
A unique tandem source irradiation facility, composed of an intense d-T neutron source and a ^{60}Co teletherapy unit, was used to investigate biological responses for different neutron/photon configurations. V79 Chinese hamster cells, attached as monolayers in log-phase growth, were irradiated at 37°C by either 14.8-MeV neutrons, ^{60}Co, or a mixture of 40% neutrons and 60% photons in simultaneous or sequential application. Measurements of cell survival indicate an increased effectiveness in cell killing for simultaneously administered neutrons and photons compared to that measured or predicted for sequentially applied beam modalities. An understanding of the magnitude of these interactive effects is important both for calculating accurate effective doses for neutron radiotherapy of deep-seated tumors, for which the photon component is appreciable, and for determination of environmental hazards to people occupationally exposed to mixtures of photons and neutrons. (16 refs.)

103941 The RBE for mouse skin irradiated with 3-MeV neutrons: single and fractionated doses. M.C.Joiner, R.L.Maughan, J.F.Fowler, J.Denekamp (Gray Lab. of the Cancer Res. Campaign, Mount Vernon Hospital, Northwood, England).
Radiat. Res. (USA), vol.95, no.1, p.130-41 (July 1983).
Early skin reactions on the feet of mice were measured after irradiation with 240-kVp X-rays or with neutrons from a 4-MV Van de Graaff accelerator. The results are compared with previous experiments using cyclotron-produced neutrons (Field and Hornsey 1971, 1979). Single doses, or 2, 5, or 9 equal fractions, were given to measure the RBE and repair capacity for neutrons and X-rays over the neutron dose per fraction range from 1.0 to 13.0 Gy. The RBE increased with decreasing dose per fraction, and these data could be fitted with a straight line on a log-log plot. The RBE was 4.6 at 1.0 Gy and fell to 2.1 at 13.0 Gy. These RBE values are significantly higher than those from cyclotron-produced 7.5-MeV neutrons, especially at low doses per fraction. The repair capacity was calculated from a comparison of the single-dose and fractionated data over a skin reaction range from 0.6 to 2.4. The D_2-D_1 value was 5-10 Gy for X-ray doses up to 18 Gy and <1.5 Gy for 7 Gy of neutrons. This reduced repair capacity after neutrons was even more apparent with further fractionation, becoming close to zero for neutron doses below 3 Gy. These data were used to construct quasi-survival curves for epidermal cells. (25 refs.)

87.50B Interactions of biosystems with radiations

103942 Normalization of ultrasonic scattering measurements to obtain average differential scattering cross sections for tissues. J.A.Campbell, R.C.Waag (Dept. of Electrical Engng., Univ. of Rochester, Rochester, NY, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.393-9 (Aug. 1983).
An integral expression is derived for the normalization of ultrasonic scattering data to obtain an average differential scattering cross section per unit volume for tissue which is modeled as a random, fluidlike medium. The expression assumes narrowband signals and involves the incident beam, receiver beam pattern, and time gates. The beams and gates combine to form a window which limits the scattering volume. The derivation of the expression requires that the dimensions of the window be large compared to the correlation length of the scattering medium. Numerical values of the normalizing integral are given for cylindrical and beamlimited scattering volumes as a function of incident frequency and scattering angle under the assumptions of Gaussian beams and rectangular time gates. A set of curves is presented to relate the percent difference between the result of backscatter from a cylindrical scattering volume and from a beamlimited scattering volume which does not include the truncation effect of the cylinder boundary. Although similar in form to normalizations used by others, the integral in this paper is obtained from a derivation which treats physical parameters rigorously and provides a precise statement of conditions which are sufficient to obtain system-independent scattering data. (16 refs.)

103943 Refractometry of fungi. S.Joseph (Dept. of Cell Biology & Anatomy, Univ. of Sheffield, Sheffield, England).
J. Microsc. (GB), vol.131, pt.2, p.163-72 (Aug. 1983).
Immersion refractometry is based on matching the refractive index of the medium to that of the cytoplasm of the cell, in which case the latter will have minimum contrast in the phase contrast microscope and will practically disappear. The cytoplasm is then said to be at the match point with the medium. Since the refractive index of a solution is related to its concentration by the formula $n - n_0 = \alpha C$, the values for the refractive indices can be expressed in terms of the concentration of solids (g/100 ml) which in fact has been done throughout this work. The properties of a suitable immersion medium, its preparation and interpretation of numerical results are discussed. Refractometric measurements were carried out on fungal hyphae and spores. The solid concentration in hyphae varies according to their age, physiological state and function. The solid concentration of mature, resting spores was found to be in the range of 45-54%, with the exception of powdery mildew spores in which the concentration of solids was 30-32%. The germination of spores is preceded by a fall in the concentration of solids, and subsequent swelling before the emergence of the germ tube. When the solid concentrating in pregermination spore has fallen to about 20-30%, metabolic activity can take place and germination can occur. (21 refs.)

87.50C Bioacoustics (sonic and ultrasonic effects on living matter)

103944 Ultrasound does not affect human lymphocyte transformation in vitro. A.K.Katoh, S.Charoensiri (Dept. of Pathology, Mercy Hospital, Pittsburgh, PA, USA).
J. Clin. Ultrasound (USA), vol.11, no.6, p.305-7 (Aug. 1983).
The lymphocyte transformation test has been used in testing the effect of ultrasound on human lymphocytes. The test utilizes the mitogenic lectins, phytohemagglutinin, concanavalin A, and pokeweed mitogen to stimulate the incorporation of ^{3}H-thymidine into resting lymphocytes after several days in culture. Ultrasound, which is increasingly used in diagnostic radiology, has been reported as an immunosuppressive agent in mice (Anderson and Barrett, 1979). Lymphocyte transformation has been used clinically as a test measuring the effectiveness of immunoenhancing and immunosuppressive therapies. The experiments reported here do not demonstrate an immunosuppressive role for ultrasound on human lymphocytes. (5 refs.)

103945 Mechanism of action of ultrasound of low intensity on mitochondria. V.A.Selivanov, V.P.Zinchenko, A.P.Sarvazyan (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.4, p.679-83 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.653-6 (1982).
Ultrasound with an intensity of 0.2 W/cm^2 acts on the transport of ions across the mitochondrial membrane. In the presence of 1 mM EGTA in the incubation medium ultrasound delays the release of K^+ into the external medium after addition of uncoupler (2,4-DNP). After addition to the initial medium of 100-400 mM Ca^{2+} exposure to ultrasound reduces the amount of Ca^{2+} adsorbed by the mitochondria and increases the rate of electroneutral $Ca^{2+}/2H^+$ exchange. When no Ca^{2+} ions are added to the incubation medium ultrasound does not influence the rate of respiration coupled and uncoupled by 2,4-dinitrophenol or the process of oxidative phosphorylation. (12 refs.)

103946 Study of ultrasonic haemolysis of erythrocytes in normal and pathological conditions. F.I.Braginskaya, G.G.Sultanova, V.B.Akopyan, D.B.Korman, K.Ye.Kruglyakova (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.4, p.709-14 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.679-83 (1982).
A method of automatic recording of the kinetics of ultrasonic (US) haemolysis has been devised. The quantitative parametrs characterizing the mechanical stability of the erythrocytes (time and rate of haemolysis, time of semidestruction, percentage distribution of erythrocytes by haemolytic stabity) have been studied. The results fundamentally differ for the erythrocytes in normal conditions and in the tumours studied. It is shown that the mechanical stability of the erythrocytes increases in the presence of tumour in the body as compared with normal. Analysis of the curves of differential distribution of

the erythrocytes by their resistance to US reveals accumulation of red blood cells, the membranes of which possess enhanced resistance. The effective rate constants of haemolysis of the erythrocytes in a suspension on exposure to ultrasound are calculated. (8 refs.)

103947 The induction of hyperthermia by ultrasound: its value and associated problems. I. Single, static, plane transducer. G.ter Haar (Phys. Div., Inst. of Cancer Res., Sutton, England), J.W.Hopewell.
Phys. Med. & Biol. (GB), vol.28, no.8, p.889-96 (Aug. 1983).
The temperature distributions that may be achieved in mammalian tissues by ultrasonic heating have been studied. Thigh muscle of Large White pigs has been irradiated with 0.75 and 3.0 MHz ultrasound at spatial average intensities in the range 1.5-3.0 W cm^{-2} in both pulsed and continuous modes of delivery. Resultant temperature profiles are described and some of the problems arising are discussed. (11 refs.)

Intense sounds may alter the mechanical properties of the cochlear partition ... .See Entry 103871

Changes in the immunobiological reactivity under the combined effect of microwave-, infrasonic- and γ-radiations ....See Entry 103948

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

103948 Changes in the immunobiological reactivity under the combined effect of microwave-, infrasonic- and γ-radiations. Yu.G.Grigor'ev, G.V.Batanov, V.S.Stepanov (Inst. of Biophys., USSR Ministry of Health, Moscow, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.406-9 (1983). In Russian.
In experiments on rats and rabbits a study was made of the combined effect of 9.3 GHz and 0.1 GHz microwaves (200 and 1530 $\mu W/cm^2$, respectively), infrasound (8 Hz, 115 db), and γ-radiation (cumulative dose 5.5 Gy) on cell and humoral immunity, and on autoimmune processes. It was shown that preirradiation with microwaves increased the resistance of the organism to γ-radiation, and microwaves combined with infrasound enhanced the biological effect of γ-radiation. (13 refs.)

103949 Blue light effect on proton pumping by bacteriorhodopsin. K.Ohno, R.Govindjee, T.G.Ebrey (Dept. of Physiology & Biophys., Univ. of Illinois, Urbana, IL, USA).
Biophys. J. (USA), vol.43, no.2, p.251-4 (Aug. 1983).
Proton pumping in closed vesicular systems containing bacteriorhodopsin that is initiated by an orange flash is diminished by a subsequent blue flash. This blue light effect is due to light absorbed by the photocycle intermediate M412 (M), which was formed by the orange flash. A kinetic analysis of the blue-light-induced reduction of proton pumping shows that of the two components of M, only the slowly decaying component is involved in the reduction of proton movement. This may be the first correlation between a proton movement and a specific photochemical intermediate of bacteriorhodopsin. Furthermore, the authors report that blue light, acting on the slowly decaying intermediate, probably causes a movement of the protons in a direction opposite to that normally seen for light absorbed by bacteriorhodopsin. (15 refs.)

103950 Pulsing electromagnetic fields induce cellular transcription. R.Goodman (Dept. of Pathology, Columbia Univ., New York, NY, USA), C.A.L.Bassett, A.S.Henderson.
Science (USA), vol.220, no.4603, p.1283-5 (17 June 1983).
Weak, pulsing electromagnetic fields can modify biological processes. The hypothesis that responses to such induced currents depend on pulse characteristics was evaluated by using transcription as the target process. Two pulses in clinical use, the repetitive single pulse and the repetitive pulse train, were tested. These pulses produced different results from each other and from controls when transcription in dipteran salivary gland cells was monitored with tritiated uridine in transcription autoradiography, cytological nick translation, and analysis of isolated RNA fractions. The single pulse increased the specific activity of messenger RNA after 15 and 45 minutes of exposure. The pulse train increased specific activity only after 45 minutes of exposure. (18 refs.)

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

103951 Ionizing radiation: sources and biological effects.
Nucl. Saf. (USA), vol.24, no.3, p.372-82 (May-June 1983). (no refs.)

103952 Effect of X-ray irradiation on the intensity of superweak luminescence of the whole blood. I.V.Lisovskii, V.V.Chumakov, E.N.Dombrovskii.
Med. Radiol. (USSR), vol.28, no.7, p.50-1 (July 1983). In Russian.
X-ray irradiation of white rats by doses of 5-10 Gr produced intensification of superweak luminescence of the whole blood 24 hr after irradiation. There was no evidence of a precise dose-effect relationship according to the criterion of superweak luminescence of the blood: nevertheless, irradiation of the animals with doses of 5-8 Gr caused a statistically significant difference in the intensity of blood luminescence by comparison with that in rats irradiated with doses of 9-10 Gr, which brought about the development of an intestinal syndrome. (5 refs.) *A.J.B.*

103953 A cytophotometric study of protein in tumours after irradiation and the use of dihydromonocalcium phosphate. S.S.Yakovleva.
Med. Radiol. (USSR), vol.28, no.7, p.52-4 (July 1983). In Russian.
The author et al. previously demonstrated experimentally a significant increase in the effectiveness of the treatment of tumours by X-ray irradiation and administration of dihydromonocalcium phosphate (DMP). In the present study the mechanism of the antitumoural effect of this combined treatment is investigated by means of an examination of the protein content of tumours in white rats after irradiation and the use of DMP. The results indicate that under the conditions of X-ray irradiation, which scarcely alters the dimensions of the tumoural cells, the concentration and overall content of protein in the cells decreases, and adenosine triphosphate derived from DMP causes calcification of the tumours with subsequent deletion of the cellular elements. The combined treatment of X-ray irradiation and administration of DMP produces a marked reduction of the area of the tumoural cells. (9 refs.) *A.J.B.*

103954 Short-term induced hyperglycemia in experimental tumour radiation therapy. N.R.Vepkhvadze.
Med. Radiol. (USSR), vol.28, no.7, p.54-5 (July 1983). In Russian.
Recent studies have demonstrated the successful use of short-term induced hyperglycemia (SIH) as a modifying agent in the radiation therapy of tumours, e.g. its use both before and after irradiation of a substantial form of Erlich's carcinoma in mice (see S.P. Jarmonenko et al., ibid., no.2, p.46-50, 1981). The present work is an investigation of the effect of SIH in conjunction with radiation therapy on white male rats injected with sarcoma-45. SIH was induced by multiple intraperitoneal injections of a 40% solution of glucose. The results showed that SIH substantially reinforced the antitumoural effect of irradiation. This was manifested by acceleration of the rate of regression of tumours, an increase in the number of animals displaying temporal remission, and also by increase in the number of 'cured' animals. The creation of SIH after irradiation, rather than before, appeared to be the more effective. (4 refs.) *A.J.B.*

103955 Mechanism of radiation-induced damage of secondary DNA structure. B.I.Sukhorukov, L.I.Shabarchina (Inst. of Biological Phys., USSR Acad. of Sci., Pushchino, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.296-301 (1983). In Russian.
Describes the mechanism of radiation-induced damage of a secondary DNA structure that a double-helical brim conformation adjacent to a local defect in the secondary structure, and the thermoactivated threshold process of a 'confluence' of the defects are present in the irradiated DNA. It is supposed that the major type of the radiation damage to the spatial DNA structure is a triple helix repaired with the aid of the specific endonuclease. (22 refs.)

103956 Theoretical analysis of the effect of photoreactivation of γ-irradiated E. coli cells. V.A.Pitkevich, V.V.Duba, M.N.Myasnik, I.V.Petrova, V.G.Skvortsov (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.307-11 (1983). In Russian.
The assumption that the formation of purimidine dimers in E. coli cells, placed in a transient aqueous medium exposed to γ-quanta, is conditioned by Cerenkov radiation laid the basis for the development of a biophysical model to explain the photoreactivation effect observed. The dependence of the effect upon γ-radiation energy and the volume of the exposed suspension is predicted and compared with experimental data. (25 refs.)

103957 Paramagnetic centers in tissues of γ-irradiated rats treated with hormones. L.N.Markevich (Inst. of Biological Phys., USSR Acad. of Sci., Pushchino, USSR), I.K.Kolomitseva, L.P.Kayushin, Ya.I.Azhipa.
Radiobiologiya (USSR), vol.23, no.3, p.312-17 (1983). In Russian.
In the experiments reported it was shown that γ-radiation (8-16 Gy) did not influence the number of paramagnetic centers of hemal ($g=2.42$, $g=2.25$) and nonhemal ($g=1.94$) iron of rat tissues: free radicals were significantly reduced 5 min after 16 Gy irradiation. The combined effect of γ-radiation (8 Gy) and ubiquinone-9 decreased the number of the above-mentioned ESR signals after 48 h. The number of free radicals in the rat liver, kidneys and spleen was almost twice reduced 28 days following castration. The administration of methyl testosterone increased the free radical amount in the heart and was ineffective in other rat organs. (15 refs.)

103958 Circulating macromolecular complexes in rats surviving radiation, thermal and mixed radiation-and-thermal traumas. D.V.Korogodin, O.I.Kurochkina, A.M.Poverennyi, A.I.Britun (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.369-71 (1983). In Russian.
In experiments on rats it was shown that radiation and thermal traumas caused a reduction in the number of circulating macromolecular complexes, determined by the nephelometric method, by the end of the first 24 h following the damaging effect; on the 3rd day, the amount of these complexes was a minimum. The combined radiation-and-thermal damage produced an additive effect. The authors discuss the nature of the observed decrease in the number of circulating macromolecular complexes. (5 refs.)

103959 Changes in water-electrolyte exchange in the rat brain after γ-irradiation of the head. I.B.Ushakov, V.P.Fedorov.
Radiobiologiya (USSR), vol.23, no.3, p.372-5 (1983). In Russian.
Biochemical and morphological methods were used to study the direct damaging effect of radiation (5.16 C/kg) on rat brain structures. The reaction of the astrocytic-capillary complex leading to disturbances in trophism and water-electrolyte exchange was investigated. (16 refs.)

103960 Effect of adrenalectomy and irradiation on some indices of protein metabolism in rat erythrocytes. I.A.Serebrennikova, N.I.Kolesova (Tomsk State Medical Inst., Tomsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.381-3 (1983). In Russian.
The experiments reported show that amount of residual and amino nitrogen in erythrocytes increases considerably 24 h after irradiation (5 Gy, 25 MeV betatron) of intact and sham ectomized rats. Adrenalectomy followed by irradiation with the same dose reduces the activity of proteolytic processes in rat erythrocytes. (13 refs.)

103961 The results of cytogenetic analysis of human peripheral blood lymphocytes performed at various times after radiotherapy. A.K.Ryabukha, L.P.Krivosheeva (Central Sci. Res. Inst. of Roentgenology & Radiology, USSR Ministry of Health, Leningrad, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.383-6 (1983). In Russian.
A study was made of the changes in the chromosome apparatus of peripheral blood leukocytes after radiotherapy of patients with uterux cervix cancer (a cumulative dose 70-90 Gy). Cells with chromosome apparatus lesions and a maximum number of chromosome aberrations were intensively eliminated during the first 3-5 years following irradiation. Later (up to 7-9 years) their level stabilized to be 5-6 times higher than the control. (13 refs.)

103962 Modifying effect of radiation on sodium and water transport in rabbit small intestine in different irradiation conditions. A.V.Mtskhvetadze, M.A.Aivazishvili (Georgian Cancer Res. Center, Georgian Ministry of Health, Tbilisi, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.386-9 (1983). In Russian.
A study was made of the effect of X-radiation on sodium and water transport within a section of rabbit small intestine. The effects induced by radiation doses of 0.21 and 0.39 C/kg were compared. The authors discuss the possibility of modification of the radiation lesions by the administration of cystamine prior to irradiation. (5 refs.)

103963 'Pseudonormal' thymocytes: a peculiar response of lymphoid elements of the thymus cortex to high doses of ionizing radiation. S.E.Aleksandrova, V.A.Gulyaev (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.401-3 (1983). In Russian.
The method of electron microscopy was used to study the phenomenon of 'paradoxical resistance' of thymocytes to very high radiation doses (40 and 200 Gy). The formation of 'pseudonormal' thymocytes, which represented a

peculiar form of radiation death of these cells, was shown to be a function of radiation dose and time after irradiation. (5 refs.)

103964 Changes in the small intestine functions of rats after radiation and thermal affection. V.S.Nesterenko, A.V.Piskarev (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.404-6 (1983). In Russian.
A study of the small intestine functions after radiation and thermal affection of rats has revealed an inhibited absorption of carbohydrates, fats and proteins. The disturbance of the resorption of these substances results from a change in the motor-evacuator function and a decrease in the activity of the appropriate enzymes in the small intestine mucosa. (10 refs.)

103965 Postirradiation recovery of yeast Pichia pinus. A.V.Glazunov, P.N.Lobachevskii (Joint Inst. of Nuclear Res., Dubna, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.409-12 (1983). In Russian.
A study was made of the postirradiation recovery of yeast Pichia pinus exposed to γ-quanta and α-particles. No recovery was noted in haploid cells: the nonreversible component $k=1$. In diploid cells, the nonreversible component $k=0.7$ and 0.8 after exposure to γ-quanta and α-particles, respectively. (8 refs.)

103966 Recent results of the German Thorotrast study—epidemiological results and dose effect relationships in Thorotrast patients. G.Van Kaick, D.Lieberman, D.Lorenz, W.J.Lorenz, H.Luhrs, K.K.Scheer, H.Wesch (Inst. fur Nuklearmedizin, Deutschen Krebsforschungszentrums Heidelberg, Heidelberg, Germany), H.Muth, A.Kaul, H.Immich, G.Wagner, K.Wegener.
Health Phys. (GB), vol.44, suppl.1, p.299-306 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
The German Thorotrast Study includes 5159 Thorotrast patients and 5160 control patients. 887 Thorotrast patients and 660 control patients could be clinically and biophysically examined and followed-up. The mean age at injection or hospitalization in the case of the control group was 28 yr. The mean injected volume of Thorotrast was calculated to be 24.7 ml and the X-ray films of 249 Thorotrast patients showed paravascular deposits. In the meantime 432 Thorotrast patients and 122 patients of the control group have died. Among the deceased patients the authors have registered (Thorotrast vs. control): hepatic tumours 152/0; myeloproliferative diseases 10/0; Hodgkin's diseases 2/0; nonHodgkin's lymphomas 5/1; bronchogenic carcinomas 13/6; pleural mesothelioma 1/0; bone sarcoma 1/1(?); sarcoma at injection site 1/0; hepatic cirrhosis 90/6; bone marrow failure 8/1; other neoplastic diseases 46/19; other nonneoplastic diseases 151/88. The cumulative incidence of liver tumors depends on the dose rate to liver tissue and is not influenced by the age at injection. A dose effect relationship for the myeloproliferative diseases is not yet apparent. (17 refs.)

103967 Comparison of radiological changes in humans and beagles with skeletal deposits of radium. J.P.Morgan, R.R.Pool (School of Veterinary Medicine, Univ. of California, Davis, CA, USA).
Health Phys. (GB), vol.44, suppl.1, p.353-63 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Semimonthly injections of ^{226}Ra were given to a group of beagle dogs. Periodic skeletal radiography followed, as well as histological studies of the bones. Measurements were also made of radium body content in 2259 occupationally or iatrogenically exposed persons. Of these, 1768 had skeletal radiography (one or more times). In humans, the radiographic changes were, in decreasing order of frequency, osteolytic cortical and cancellous bone destruction, bone sclerosis, pathological fracture, and avascular necrosis of bone. In beagles, osteolytic destruction and pathological fractures were common, avascular necrosis was not observed, but there was frequently cortical thickening and new-bone formation in cancellous bone. In both population groups, there was a high incidence of bone sarcoma. In the beagles, one high-dosage group numbering 38 dogs had 49 malignant bone tumors. Among the 2259 measured persons, there were 60 who had bone sarcoma, and 29 who had cancer of the mastoids or paranasal sinuses. No significant skeletal effects have been diagnosed radiologically in persons with systematic intakes of ^{226}Ra or ^{228}Ra below about 10 μCi or with skeletal doses below about 100 rad. (15 refs.)

103968 Chromosome damage in peripheral lymphocytes from American thorium workers. S.F.Hoegerman, H.T.Cummins (Center for Human Radiobiology, Argonne Nat. Lab., Argonne, IL, USA).
Health Phys. (GB), vol.44, suppl.1, p.365-71 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
An analysis of the frequency of chromosome aberrations in lymphocytes from 47 thorium workers and three external controls is presented. Thirty-seven of these cases were divided into three age-matched groups based upon the means of the sums of their emanating radium-224 and bismuth-212 (Ra+Bi) burdens. The low burden group (mean Ra+Bi burden$=-0.06\pm0.03$ nCi) had two two-break chromosome aberrations in 1200 cells, the moderate burden group (mean Ra+Bi burden 0.21 ± 0.03 nCi) had three such aberrations in 1000 cells and the high burden group (mean Ra+Bi burden$=0.99\pm0.21$ nCi) had five such aberrations in 1500 cells. While there is a two-fold increase in the two-break aberration frequency in pooled data from the two higher exposure groups (8/2500 cells) as compared with the lowest exposure group (2/1200 cells), the difference between these subsamples is not statistically significant ($p=0.32$). The frequency of dicentrics and centric ring chromosomes (8/3300 cells) in the pooled higher body burden groups from the total sample (mean Ra+Bi burden$=0.56\pm0.9$ nCi) does however show a very highly significant increase over the historical control frequency. (15 refs.)

103969 Dose-response relationships for bone cancers from plutonium in dogs and people. B.A.Muggenburg, J.A.Mewhinney, W.C.Griffith, F.F.Hahn, R.O.McClellan, B.B.Boecker, B.R.Scott (Inhalation Toxicology Res. Inst., Lovelace Biomedical & Environmental Res. Inst., Albuquerque, NM, USA).
Health Phys. (GB), vol.44, suppl.1, p.529-35 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
The risk of bone cancers developing from internally deposited plutonium must be estimated from studies in laboratory animals because no plutonium-induced cancers must have observed in people. Studies of the effects of ^{226}Ra and ^{239}Pu injected into beagle dogs at the University of Utah and $^{238}PuO_2$ inhaled by beagle dogs at the authors' institute provide a key link to understanding the long term effects of inhaled α-emitting radionuclides in people. Injected radium and plutonium are rapidly deposited in bone whereas plutonium deposited in lung by inhalation is translocated to bone more slowly, depending on its chemical form. The development of bone cancers is a late occurring effect seen after either injection of plutonium or radium or inhalation of plutonium. The incidence of bone cancers from α radiation to the skeletons of dogs was compared to bone cancer incidences in radium dial painters to estimate bone cancer risk from inhaled plutonium in people. A risk factor of 1200 bone cancers/10^6 rad to skeleton (average dose) was estimated. (10 refs.)

103970 Relative effectiveness of ^{241}Am vs. ^{226}Ra approached by haemopoietic stem cell studies in various bone marrow sites of contaminated mice. G.E.R.Schoeters, O.L.J.Vanderborght (Radiobiology Dept., Belgian Nuclear Centre, Mol, Belgium).
Health Phys. (GB), vol.44, suppl.1, p.555-70 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Haemopoietic stem cell assays allow investigation of local radiation damage at any time after contamination. These techniques were used to determine the relative effectiveness of ^{241}Am and ^{226}Ra in inducing damage in various cortical and trabecular bone marrow sites. Male Balb/c mice were injected with either 230 or 660 kBq $^{226}RaCl_2$/kg body weight with one of three doses of monomeric ^{241}Am citrate at 138, 552 or 768 kBq ^{241}Am/kg body weight. At 7 time intervals after injection (from 4 hr to 100 days) the colony-forming capacity of pluripotent stem cells (CFU-s) and macrophage-granulocyte committed stem cells (CFU-c) was assayed in sternal marrow, marrow of lumbar vertebrae, of the trabecular distal end of the femur and of the femoral shaft (in which were distinguished axial marrow and marrow situated peripherally near the cortical bone). ^{226}Ra retention and ^{241}Am retention were measured in these bone sites. Skeletal doses and doses to the bone marrow sites were calculated. On the base of injected activity, ^{241}Am was more effective than ^{226}Ra in reducing the number of CPU-s and CFU-c but the effectiveness varied in the various bone marrow sites. CFU-s and CFU-c response is considered in relation to the retrained radioactivity in the surrounding bone matrix and in relation to the mean marrow dose. (42 refs.)

103971 A note on radium body content and breast cancer in UK radium luminisers. K.F.Baverstock, J.Vennart.
Health Phys. (GB), vol.44, suppl.1, p.575-7 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Re-examines data from an earlier report by the authors (see K.F. Baverstock et al., Lancet i, p.430-3, 1981). The authors feel that in that study the excess breast cancer could have been only marginally the result of a soft tissue dose from α-particles. The external γ-ray dose from the working environment might have been responsible. However, attention is drawn to the possibility that causes other than radiation may have contributed. (3 refs.)

103972 UDS and SCE in lymphocytes of persons occupationally exposed to low levels of ionizing radiation. H.Tuschl, R.Kovac, H.Altmann (Inst. fur Biologie, Seibersdorf, Austria).
Health Phys. (GB), vol.45, no.1, p.1-7 (July 1983).
Unscheduled DNA synthesis (UDS) induced by in vitro UV irradiation was investigated in lymphocytes of persons occupationally exposed to low doses of ionizing radiation (maximum registered radiation dose: 98 mrad/month). For radiation exposures >14 mrad/month above background level, increased rates of UDS after in vitro UV irradiation of lymphocytes were found. The bromodeoxyuridine differential chromatid labeling technique was applied to the examination of spontaneous and Mitomycin C (MMC)-induced sister chromatid exchanges (SCE) in the same population. No statistically significant difference could be determined in spontaneously occurring SCEs, while MMC induced SCEs were significantly reduced in persons exposed to radiation doses >14 mrad/month, thus indicating increased repair capability for DNA lesions inflicted by a second insult after protracted low-dose irradiation. (26 refs.)

103973 A demographic model for performing site-specific health risk projections. J.J.Collins, R.T.Lundy, D.Grahn (Argonne Nat. Lab., Argonne, IL, USA).
Health Phys. (GB), vol.45, no.1, p.9-20 (July 1983).
An extension of an earlier life table model for estimating health risks in occupationally exposed workers is presented (see ibid., vol.40, p.439, 1981). The extension of the earlier methodology incorporates specific fertility assumptions and therefore produces a model that is able to perform health risk projections for populations living in or around sites that release agents with potentially adverse health consequences. Results show that fertility patterns are important for assessing risk, even for short-term projections. The interaction of initial age structure, competing risks from other causes of death, and fertility patterns are all important in determining future levels of excess mortality from various pollutants. (10 refs.)

103974 Iodine-129 uptake and effects of lifetime feeding in rats. S.A.Book (Lab. for Energy-Related Health Res., Univ. of California, Davis, CA, USA).
Health Phys. (GB), vol.45, no.1, p.61-6 (July 1983).
Irradiation of thyroid glands in rats at a dose rate of approximately 1 rad/day from continually ingested ^{129}I resulted in no significant increase in thyroid tumors compared to controls, nor in other thyroidal effects, nor was there any difference in longevity between the two groups. Marked decreases in ^{131}I uptake by thyroid glands of ^{129}I-fed rats were observed, but these decreases reflected 'blocking' of the thyroid by the large quantities of iodine required because of the low specific activity of ^{129}I. In view of the lack of effects on the thyroid gland invoked by lifetime exposures to ^{129}I, and considering the low specific activity of the radionuclides and the limited capacity of the thyroid gland for iodine, the hazard from ^{129}I appears to be extremely limited. (24 refs.)

103975 Radiation-induced DNA strand breaks and cell pycnosis in the developing rat cerebellum. H.Cerda (Dept. of Phys. Biology, Gustaf Werner Inst., Uppsala, Sweden).
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.113-21 (Aug. 1983).
DNA strand breaks and cell pycnosis induced by ^{60}Co gamma radiation were studied in the developing rat cerebellum. Rats 2, 5 or 12 days old were irradiated and the repair of DNA strands breaks was studied at various intervals up to seven hours. DNA strand breaks were repaired in 30 min and post-repair DNA degradation was observed about 90 min after irradiation in 12 day old rats and some time later in the younger ones. The pycnotic activity in the external granular layer of the cerebellar cortex seen in histological preparations developed in a similar way, the older rats showing earlier signs of cel pycnosis and a faster degradation of DNA. A correspondences was found between DNA degradation and cell pycnosis. (8 refs.)

103976 Effects of ionizing radiation on nitric oxide myoglobin. I. Effects on the NO-haem moiety. A.R.Kamarei, M.Karel (Dept. of Nutrition & Food Sci., MIT, Cambridge, MA, USA).
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.123-34 (Aug. 1983).
Bovine nitric oxyde myoglobin (NOMb) was irradiated with 40-4000 krad of γ-radiation, and the effects on the haem studied using absorption spectroscopy and electron spin resonance (e.s.r.) spectroscopy. The bright red colour of NOMb changed to brown upon irradiation. This is similar to changes observed in radiation sterilized nitrite-containing meats. NOMb become progressively denitrosylated, with met-myoglobin (metMb) as the immediate product. Upon increasing doses of radiation (up to 800 krad) at 0°C parallel to

NOMb denitrosylation, metMb was gradually converted, by water radiolytic products, to other products, believed to be ferromyoglobin and ferrimyoglobin peroxide. A minor quantity of 'choleglobin-type' pigments may also be formed at the highest doses. (38 refs.)

103977 Effects of ionizing radiation on nitric oxide myoglobin. II. Effects on the globin moiety. A.R.Kamarei, M.Karel (Dept. of Nutrition & Food Sci., MIT, Cambridge, MA, USA).
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.135-42 (Aug. 1983).
For pt.I see ibid., vol.44, no.2, p.123-34, 1983. Irradiation of nitric oxide myoglobin (NOMb) induces changes in the haem as well as protein moiety of NOMb, especially at doses of 400-800 krad. On the basis of the experiments reported the changes in the protein include: (*a*) Conformational changes, with apparent partial denaturation of globin α-helix as evidenced by circular dichroism. (*b*) Preferential scission of the polypeptide chain and dimerization via covalent bond(s) as evidenced by SDS-polyacrylamide gel electrophoresis. Products with a spectrum of hydrodynamic volumes between those of the monomer and the dimer are also formed. (*c*) The shift of NOMb pIs toward more acid pHs (probably due to modification and/or destruction of basic amino acid residues by water radiolytic products) as evidenced by isoelectronic focusing. (23 refs.)

103978 Micronucleus induction in Vicia faba roots. I. Absence of dose-rate, fractionation, and oxygen effect at low doses of low LET radiations. I.Marshall (Kernforschungszentrum Karlsruhe, Inst. fur Kernphys., Karlsruhe, Germany), M.Bianchi.
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.151-62 (Aug. 1983).
Micronucleus indication in Vicia faba roots has been evaluated after irradiation with ^{60}Co γ-rays. The dependence of the damage on dose, dose rate, fractionation, and oxygen has been studied. The best fit to the experimental data in the dose region between 7 and 190 cGy is represented, for single-dose exposures, by a linear+quadratic relationship. In the low-dose region, between 7 and 20 cGy, where the linear dose dependence is dominant, no dose-rate, fractionation, or where the linear dose dependence is dominant, no dose-rate, fractionation, or oxygen effect could be observed. These effects were, however, present in the high-dose region, where the quadratic dependence is dominant. (32 refs.)

103979 Incidence of radiation-induced skin tumours in mice and variations with dose rate. E.V.Hulse, S.J.Lewkowicz, A.L.Batchelor, D.G.Papworth (M.R.C. Radiobiology Unit, Harwell, Didcot, England).
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.197-206 (Aug. 1983).
Mice were exposed to weakly penetrating beta-particles from an external source, using 12 different surface doses ranging from 5.4 to 260 Gy and given at four different dose rates from 200 to 1.7 cGy/mon. As in previous investigations, both epidermal and dermal tumours occurred with the latter predominating. The lowest surface dose to produce a statistically significant increase in skin tumours can have an exceptionally long latent period leads to the suggestion that there is some relatively radioresistant factor which normally restrains potential radiation-induced cancer cells in the skin from becoming tumours until the skin is subjected to high local doses. Tumour-induction was unaffected by reducing the highest zone rate by a factor of 10 and the dose-response curves were almost identical. Further reductions of dose rate, encompassing a further factor of 10, in general resulted in fewer tumours. (25 refs.)

103980 Natural cell-mediated cytotoxicity among A-bomb survivors residing in the United States. E.T.Bloom (Geriatric Res., Education & Clinical Center, West Los Angeles, VA, USA), E.L.Korn, D.S.Toji, T.Makinodan.
Int. J. Radiat. Biol. (GB), vol.44, no.2, p.213-18 (Aug. 1983).
Natural cell-mediated cytotoxicity (NCMC) by lymphocytes from Japanese atomic bomb survivors now living in the United States was measured. Seventy-one individuals were exposed to an estimated '0.00' Gy ('0 rads') (S_0 group) and 58 to greater than '0.00 Gy' (S_+ group) at the time of the bomb. Of this 58, 51 (88 per cent) received less than 0.50 Gy and 30 (52 per cent) received less than 0.10 Gy. NCMC was measured against ^{51}Cr-labelled K562 target cells. Activity by lymphocytes from S_+ group donors was significantly greater than that for the S_0 group ($p=0.028$ by the stratified Wilcoxon rank-sum test). This difference between the S_+ and S_0 populations was detected 35 years after exposure to the bomb. It is therefore feasible and important to examine appropriate biologic parameters to elucidate the effects of low doses of radiation in humans. (25 refs.)

103981 Response of mouse lung to irradiation at different dose-rates. R.P.Hill (Ontario Cancer Inst., Princess Margaret Hospital, Toronto, Ontario, Canada).
Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1043-7 (July 1983).
Groups of LAF1 mice were given thoracic irradiation using ^{60}Co γ-rays at dose-rates of 0.05 Gy/min (LDR) or 1.1 Gy/min (HDR) and the death of the animals was monitored as a function of time. It was found that the time pattern of animal deaths was similar for the two different dose-rates. Dose response curves for animals dying at various times up to 500 days after irradiation were calculated and the LD_{50} values determined. The curves for the LD_{50} values, plotted as a function of the time at analysis for treatment at HDR or LDR, were essentially parallel to each other but separated by a factor (LDR/HDR) of about 1.8. This indicates that the sparing effect of LDR treatment is the same for deaths occurring during the early pneumonitis phase or during the late fibrotic phase of lung damage. The available information on the response of patients to whole thoracic irradiation, given for either palliation or prior to bone marrow transplantation, suggests that for similar dose-rates to those studied here the ratio (LDR/HDR) is only 1.2-1.3. This difference between the animal and human data may reflect the modifying effect of the large doses of cytotoxic drugs used in combination with the irradiation of bone marrow transplant patients. (24 refs.)

103982 RBE of SPLEEN CFU-S to low dose rate Cf-252 or photon radiation in vivo. Y.Maruyama, C.Nava, J.Feola, J.L.Beach, Hung-Nien Hwang, A.Williams (Dept. of Radiation Medicine, Univ. of Kentucky Medical Center, Lexington, KY, USA).
Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1049-56 (July 1983).
The biological effects of low dose rate (LDR) Cf-252 radiation were compared to LDR Cs-137 photon radiation and acute ^{60}Co radiation. The RBE_n for endogenous CFU-S in vivo was 2.1 for neutron radiation at a dose rate of 9.9 cGy/hr of Cf-252 radiation. The value was consistent with previous in vitro experiments where a value of 2.1 was found. For the low doses and low dose rates studied, the authors tested at acute assay dose following the LDR irradition to determine dose-effect and RBE_n. Organ size shrinkage and regeneration patterns after LDR Cf-252 and Cs-137 were also studied and showed greater growth delay for Cf-252 irradiated lympho-hemopoietic tissues. (28 refs.)

103983 1982 Resident's Essay Award: the immunologic effects of lymphoid irradiation in human and non-human primates: cellular changes and the potential for renal transplantation. E.C.Halperin, G.Haas, D.E.Dosoretz, M.Gitterman, L.Barrett, A.B.Cosimi, H.D.Suit (Dept. of Radiation Medicine, Massachusetts General Hospital, Boston, MA, USA).
Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1083-9 (July 1983).
The alterations which occur in T lymphocyte numbers during a course of therapeutic irradiation in humans with Hodgkin's disease were measured. The effects of lymphoid irradiation prior to renal transplantation were studied in cynomolgus monkeys. The irradiation depleted the peripheral blood populations of all lymphocyte populations in both humans and monkeys. It is suggested that while measured cellular changes are reflections of the immunologic state, they are not necessarily the determining factors of graft/host interactions. (17 refs.)

103984 Influence of the physical structure of irradiated starches on their electron spin resonance spectra kinetics. J.J.Raffi, J.-P.L.Agnel (CEN Cadarache, Saint-Paul lez Durance, France).
J. Phys. Chem. (USA), vol.87, no.13, p.2369-73 (23 June 1983).
The authors' study deals with the shape and kinetic changes of the ESR spectra of eight irradiated starches, from several hours to several months after γ-irradiation. Whatever the origin and water content of the starches two major radicals or groups of radicals are observed. The kinetic law depends on the water content; two main zones are pointed out which are relative to the amorphous and crystalline parts of starches. (21 refs.)

103985 Inactivation of Ehrlich ascites tumor cells by heavy ions. U.Bertsche, G.Iliakis (Inst. fur Biophys., J.W. Goethe-Univ. Frankfurt, Frankfurt/Main, Germany), G.Kraft.
Radiat. Res. (USA), vol.95, no.1, p.57-67 (July 1983).
Exponentially growing and plateau-phase cultures of Ehrlich ascites tumor cells were irradiated with heavy ions ($Z \geq 20$) and assayed for loss of reproductive capacity either immediately or at delayed times after irradiation. The results indicated no modification of the exponential dose response due to conditions which usually favor the repair of potentially lethal damage (PLD) at low ionization density. Postirradiation treatment of the cells with β-arabinofuranosyladenine, a DNA synthesis inhibitor known to act on PLD repair, resulted in effects similar to those observed without this drug and confirmed the hypothesis that at such high values of ionization density only lethal, unmodifiable damage can be expressed. The inactivation cross-section values calculated from the slope of the measured survival curves showed no significant correlations with commonly used parameters of radiation quality such as LET or z^2/β^2. Instead, a functional dependence on the primary ion energy was indicated, being smaller by a factor of two at low energies (≤ 2 MeV/amu) compared with values at energies above 4 MeV/amu, where agreement with the morphological nuclear cross section of the culture was found. (19 refs.)

103986 Alternative types of duodenal ulcer induced in mice by partial X-irradiation of the thorax. A.Michalowski, S.Uehara, W.-B.Yin, J.Burgin, J.A.Silvester (MRC Cyclotron Unit, Hammersmith Hospital, London, England).
Radiat. Res. (USA), vol.95, no.1, p.78-86 (July 1983).
The study reported extends the authors' earlier observations (see A. Michalowski, Br. J. Radiol., vol.54, p.713, 1981; A. Michalowski and J. Burgin, in Progress in Radio-Oncology II, p.105-10) on gastrointestinal pathology in thorax-irradiated female CFLP mice. It shows that exposure of the lower mediastinum to single doses of 14-30 Gy X-rays results in the formation of the proximal duodenal ulcer accompanied frequently by erosion of the antral gastric mucosa. X-irradiation of the lateral thoracic fields is responsible for single ulcers in the proximity of duodenal papilla, often associated with a circumscribed area of degeneration of the fundic mucosa of the stomach. In view of the small amount of radiation received by the subdiaphragmatic parts of the alimentary tract, these gastro-duodenal lesions represent abscopal effects of thoracic irradiation. (28 refs.)

103987 Evidence that repair and expression of potentially lethal damage cause the variations in cell survival after X-irradiation observed through the cell cycle in Ehrlich ascites tumor cells. G.Iliakis, M.Nusse (Inst. fur Biophys., Frankfurt/Main, Germany).
Radiat. Res. (USA), vol.95, no.1, p.87-107 (July 1983).
The survival of synchronously growing Ehrlich ascites tumor cells was measured after X-irradiation in various stages of the cell cycle. Cells at the beginning of S or in G2+M phase showed a high level of killing, whereas cells irradiated in G1 or in the middle of S phase were more resistant. These changes resulted from a change in the survival curve shoulder width (D_q) as cells passed through the cell cycle, and the mean lethal dose (D_0) remained practically unchanged (0.8 ± 0.05 Gy). When synchronization of the cell population was further sharpened using nocodazole, exponential survival curves were obtained at the beginning of S phase and at mitosis with a $D_0=0.8$ Gy. When cells (in all stages) were incubated in balanced salt solution for 6 hr after irradiation, repair of potentially lethal damage (PLD) was observed, resulting in an increase in D_q, while D_0 remained constant. Treatment of the cells after irradiation with either caffeine (2-6 mM) or β-arabinofuranosyladenine (β-araA) (60-100 μM) or hypertonic medium resulted in an expression of PLD and reduced the D_q of the survival curve, which approached or reached an exponential line with $D_0=0.8 \pm 0.1$ Gy. It is suggested that the variations observed in cell survival through the cell cycle might reflect variations in the final amount of PLD either repaired or expressed as the cells progress through the various stages of the cell cycle. (52 refs.)

103988 Radiation-induced injury of the esophagus. R.A.Lepke, H.I.Libshitz (Dept. of Diagnostic Radiology, Univ. of Texas, Houston, TX, USA).
Radiology (USA), vol.148, no.2, p.375-8 (Aug. 1983).
Forty patients with functional or morphologic esophageal abnormalities following radiotherapy were identified. Abnormalities included abnormal motility with and without mucosal edema, stricture, ulceration and pseudodiverticulum, and fistula. Abnormal motility occurred 4 to 12 weeks following radiotherapy alone and as early as 1 week after therapy when concomitant chemotherapy had been given. Strictures developed 4 to 8 months following completion of radiotherapy. Ulceration, pseudodiverticulum and fistula formation did not develop in a uniform time frame. Radiation-induced esophageal injury is more frequent when radiotherapy and chemotherapy are combined than it is with radiotherapy alone. (10 refs.)

103989 Discriminant analysis in radiation therapy treatment planning for carcinoma of the cervix uteri. K.R.Hibbitts, D.E.Raeside, G.D.Adams, C.R.Bodardus,Jr. (Dept. of Radiological Sci., Univ. of Oklahoma Health Sci. Center, Oklahoma City, OK, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.12-21 vol.2
Discriminant analysis is applied to radiation therapy treatment planning for carcinoma of the cervix uteri, with the intention of assisting the radiation therapist in assessing the likelihood that a prescribed radiation therapy regime will lead to a successful outcome. (10 refs.)

103990 Computer systems and their applications in nuclear medicine. V.M.Spitzer (Dept. of Radiology, Univ. of Colorado Health Sci. Center, Denver, CO, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.22-31 vol.2
Computer controlled scintillation cameras and digital image processing is commonplace in modern nuclear medicine departments. The nature and origin of diagnostic nuclear medicine data is outlined. Basic computer system configurations which are commercially available for this type of data processing are presented. Some common image processing applications either utilizing or requiring the computer are also included. (19 refs.)

103991 Measurement of liver volume by ultrasound and computed tomography. P.Fritschy, G.Robotti, G.Schneekloth, P.Vock (Dept. of Diagnostic Radiology, Univ. Hospital, Inselspital, Bern, Switzerland).
J. Clin. Ultrasound (USA), vol.11, no.6, p.299-303 (Aug. 1983).
A morphometric method to calculate liver volumes from transverse sections is evaluated (point-integrating method). In the first part of the study, 10 liver specimens were investigated by computed tomography (CT) and ultrasound (US); the calculated volumes were compared to the volumes obtained by water displacement of the organs. While CT showed an ideal agreement (r=0.994), volumes calculated from US sections correlated less well (percentage differences from +12.5% to −9%, r=0.915). In the second part of the study, the livers of 10 randomly selected patients were investigated by CT and US. Liver volumes were calculated using the point-integration method. Compared to the CT examination, US results show a good correlation with a correlation coefficient of r=0.977. The point-integration method is very valuable to measure organ volumes from transverse sections. The method can be applied 'offline' to photographic films, data do not have to be recorded electronically. The time required to calculate the volume of an organ is comparable to other methods. (20 refs.)

103992 Diagnostics with ultrasound. J.M.Thijssen.
PT/Elektrotech. Elektron. (Netherlands), vol.38, no.6, p.44-7 (June 1983). In Dutch.
Diagnostics using ultrasonics has been designated 'echography' in the medical field. The types of scan available and the traces obtained are briefly outlined. A comparative table is given of echograms against X-ray pictures. Advantages of the former include the nonionising effect, better contrast, tissue imaging, dynamic application and cheapness (by a factor of 10). Some types of clinical application are described. These include the pulsed Doppler technique to measure the flow in blood vessels, echo-cardiology and the acquisition of echograms of gynaecological and optical interest. A brief mention is made of other principles with diagnostic possibilities, such as nuclear magnetic resonance, digital subtraction angiography, single photon emission tomography and X-ray computerised tomography. (3 refs.) *G.C.*

103993 Measurement of ultrasonic attenuation within regions selected from B-scan images. K.J.Parker, R.C.Waag (Dept. of Electrical Engng., Univ. of Rochester, Rochester, NY, USA).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.8, p.431-7 (Aug. 1983).
Describes the calculation of absolute ultrasonic attenuation as a function of frequency by processing backscattered signals obtained from a clinical imaging instrument. The signal processing steps are developed from a mathematical model of scattering in an attenuating medium with random inhomogeneities. Attenuation data are derived from the imaging system by recording amplitude-compressed ultrasonic echo waveforms along with transducer position information and time-varying gain values. The input-output characteristics of the receiver are employed to remove the effects of compression and gain. Attenuation values are calculated for selected regions within scans of two tissue phantoms and a normal breast. The values agree with other independent measurements and illustrate the requirements for incorporating quantitative attenuation measurements with clinical imaging. (27 refs.)

103994 Beam steering with linear arrays. O.T.Von Ramm (Dept. of Biomedical Engng. & Medicine, Duke Univ., Durham, NC, USA), S.W.Smith.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.8, p.438-52 (Aug. 1983).
The principles and techniques of real-time imaging with phased array ultrasound scanners are reviewed. Topics include (1) the geometric optics of beam steering and focusing with a linear array in the transmit and receive modes; (2) limitations on image data acquisition due to ultrasound propagation velocity; (3) optical diffraction theory for linear arrays including effects of amplitude grating lobes. Limitations on the image quality of phased array imaging systems are also discussed, including (1) nonideal response of array transducers; (2) target ambiguities caused by phase error grating lobes; (3) refraction errors; (4) delay line design. Finally, an analysis is presented of current techniques for improving ultrasound image quality using phased array methods including phase compensation, spatial compounding, frequency compounding, and parallel processing. (43 refs.)

103995 Ultrasound transducers for pulse-echo medical imaging. J.W.Hunt, M.Arditi, F.S.Foster (Dept. of Medical Biophys., Ontario Cancer Inst., Toronto, Ontario, Canada).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.8, p.453-81 (Aug. 1983).
The transducer is probably the single most important component of any ultrasonic imaging system. A basic introduction to the problems and paradoxes of transducer design is given. After introducing the piezoelectric equations and discussing important transducer material such as lead zirconate titanate and polyvinylidene difluoride, the techniques for modeling the electromechanical impulse response are reviewed. Quarter-wave matching and short pulse techniques are discussed. The prediction of the ultrasound field of plane, spherical, and conical transducers is reviewed with emphasis on the spatio-temporal impulse response technique. Finally, the use of the above approaches is illustrated in a very practical fashion for three interesting transducer geometries: (1) a split aperture device with two focal lengths, (2) a five-element annular array, and (3) a 37.5 degree conical/annular array hybrid transducer. (122 refs.)

103996 An ultrasonic technique for imaging the ventricle in three dimensions and calculating its volume. W.E.Moritz (Dept. of Electrical Engng., Univ. of Washington, Seattle, WA, USA), A.S.Pearlman, D.H.McCabe, D.K.Medema, M.A.Ainsworth, M.S.Boles.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.8, p.482-92 (Aug. 1983).
Real-time two-dimensional ultrasonic scanners provide a series of cross-sectional images of the ventricle. The authors have developed a technique which can determine the spatial position and orientation of a collection of such scans with respect to a reference coordinate system. The scans need not be parallel, may intersect, and need not demonstrate a complete cross section. The borders of interest are digitized to identify a set of points representing the surface of the ventricle. These points are used to generate a 3-D reconstruction of the chamber and are processes to give an estimate of ventricular volume. The technique has been validated using ten formalin-fixed hearts excised from dogs, sheep, and cows, with an actual volume range of 31.8-570.6 cm^3. Each ventricle was imaged five times by three observers for a total of 150 studies, by the least squares linear regression analysis, calculated volume=0.98 (actual volume) + 1.39 cm^3, r=0.99. The average error for all studies was 5 percent, while 88 percent of the individual calculated volume were within 10 percent of the actual volume. The method appears to offer the potential for the accurate assessment of ventricular volume in man. (22 refs.)

103997 Assessment of electromagnetic characteristics of the Willeford Central Auditory Processing Test Battery. S.L.Shea, M.J.M.Raffin (Univ. of Montana, Missoula, MT, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.18-21 (March 1983).
Electromagnetic characteristics of eight tape recordings of the Willeford Central Auditory Processing Test Battery were assessed. Measurements indicate that when recording levels are referenced to the calibration tone preceding a given subtest of that battery, significant intertape differences, intertest differences, and interchannel differences in the recording levels of test items exist. Mean recording levels of items used in the Rapidly Alternating Speech Perception, Low-Pass Filtered Speech, and Competing Sentences subtests typically were within 10 dB of the reference tone. Recording levels for the Binaural Fusion subtest yielded intertape differences of as much as 26.5 dB. Given the large intertape inconsistencies in recording levels, extreme caution should be exercised in the use of these recordings. (14 refs.)

103998 A noninvasive acoustic method using frequency perturbations and computer-generated vocal-tract shapes. D.A.Beckman (Univ. of Arkansas Medical Sci. Campus, Little Rock, AR, USA), D.C.Wold, J.C.Montague,Jr..
J. Speech & Hear. Res. (USA), vol.26, no.2, p.304-14 (June 1983).
Improved processing of acoustic data was investigated with two adult Down's syndrome subjects. Sustained vowel samples were processed through a fast-Fourier-transform spectrum analyzer, and digital waveform data were used to obtain period-by-period measurements of the fundamental frequencies. Unusual frequency perturbation (jitter), later identified as diplophonia, was found for one of the Down's subjects. In addition, the first three formant frequencies of the vowels were determined and, utilizing an algorithm described by Ladefoged et al. (1978), computer-generated vocal-tract shapes were plotted. Differences in vocal-tract shapes, especially for the back vowels, were observed between the Down's female and the normal shape. Correlations between vocal-tract shapes of the Down's subjects and those for a normal man or woman were computed. A partial three-way factor analysis was carried out to determine those load factors or coefficients for each subject that were due to individual differences. These procedures, offering synthesized techniques portraying the interpharyngeal/oral functioning of the speech structures, may eventually have direct noninvasive diagnostic and therapeutic benefit for voice/resonance-disordered clients. (43 refs.)

103999 Work in progress: common carotid artery contours reconstructed in three dimensions from parallel ultrasonic images. D.H.Blankenhorn, H.P.Chin, S.Strikwerda, J.Bamberger (Univ. of Southern California School of Medicine, Los Angeles, CA, USA), J.D.Hestenes.
Radiology (USA), vol.148, no.2, p.533-7 (Aug. 1983).
Three-dimensional sonograms of the common carotid artery were obtained using a device which takes images in parallel planes. Tests in phantoms simulating atherosclerotic vessels the same size as the common carotid artery indicated that the coefficient of variation of a single luminal measurement was 2-5%. (10 refs.)

104000 A comparison of two methods for determining ultrasonic intensity for medical transducers. D.G.Shombert, R.A.Robinson (Nat. Center for Devices & Radiological Health, Food and Drug Administration, Rockville, MD, USA).
Ultrasonics (GB), vol.21, no.5, p.234-6 (Sept. 1983).
The spatial and temporal average intensity (I_{SATA}) is determined for four diagnostic ultrasound transducers by two methods: (a) direct measurements (beam profiling) with a miniature hydrophone, as described in the AIUM-NEMA standard, and (b) estimating from measurements of total power and assumptions about beam size. The latter method is frequently used by diagnostic ultrasound manufacturers when reporting output levels to users and regulatory agencies. However, due to the conventions for defining beam area, this method actually overestimates the spatial average intensity. For the four transducers tested, the estimated I_{SATA} exceeds the measured I_{SATA} by several hundred percent. The spatial peak, temporal average intensity (I_{SPTA}) was

also measured for the four transducers and is less than the estimated I_{SATA} in every case. (4 refs.)

104001 Quantitative ultrasonic imaging in medical diagnosis. M.J.Flynn, P.L.Carson, C.R.Meyer (Dept. of Radiology, Univ. of Michigan, Ann Arbor, MI, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.42-53 vol.2
The use of computers for recording and analysing ultrasonic signals obtained from the insonation of human patients now permits a more definitive diagnosis of several diseases to be made. Recent results of ultrasonic velocity and attenuation imaging for breast diagnosis are presented and approaches for correlating image texture with the histology of diffuse organ diseases are described. (45 refs.)

104002 Computer enhancement and analysis of complete and selective displays of two-dimensional echocardiograms. D.E.Lovelace, S.Rasmussen, B.C.Corya, S.B.Knoebel (Krannert Inst. of Cardiology, Indiana Univ., School of Medicine, Indianapolis, IN, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.321-4
Develops a clinically adaptable computer system for accessing and directly digitizing 100% of unprocessed (raw) ultrasound signals for potential tissue type identification applications. The authors describe the system along with application of combining this system with a mathematically derived integrated backscatter ratio to detect changes in posterior LV myocardium following left circumflex coronary artery ligation in dogs. (no refs.)

104003 Compound sector scan echocardiography using a sub-probe of same frequency. M.Kuwahara, S.Eiho, H.Kitagawa, N.Asada, M.Yokoyama (Automation Res. Lab., Kyoto Univ., Kyoto, Japan).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.325-8
Phased array sector scan echocardiography has been widely used in the field of cardiology, but it has some problems to be solved such as rather poor resolution and restricted range of view of its image. To solve these problems, the authors propose a compound sector scan echocardiographic system with an additional sub-probe which transmits and receives an ultrasound pulse train of the same frequency as the main-probe at the different precordial position. The overlapped two echocardiograms obtained from the two probes are displayed on a CRT monitor in real time. (6 refs.)

104004 Mitral valve tracking of directly digitized 2D echocardiograms. D.N.Smith, A.J.Buda, Delp. A.J., J.M.Jenkins, C.R.Meyer, F.H.Splittgerber, B.Pitt (Univ. of Michigan, Ann Arbor, MI, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.329-32
The automatic estimation of mitral valve orifice area and shape changes would be useful in the assessment of valvular and myocardial disease. To assist in that estimation the authors have developed a method to directly acquire two-dimensional digital line mode data at a rate of 20 to 25 frames a second. An algorithm was developed to automatically track the mitral valve orifice boundary throughout the cardiac cycle, following an initial manually entered border on a single frame. The automated tracking algorithm will assist in the derivation of shape and area change parameters of the mitral valve through the cardiac cycle and should provide further information regarding valvular structural integrity and cardiac function. (11 refs.)

104005 Computer-assisted evaluation of patterns of ventricular contraction during induced rapid tachycardias using two-dimensional echocardiography. J.A.Werner, H.L.Green, J.R.Gorham, E.L.Bolson, B.W.Gross, C.L.Janko, G.Kime (Div. of Cardiology, Univ. of Washington, Seattle, WA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.333
Summary form only given, substantially as follows. Two dimensional echocardiography (2DE) offers precise spatial localization of ventricular anatomy. Patterns of segmental movement during the cardiac cycle should relate to patterns of electrical activation of corresponding anatomic sites and should change depending upon the origin and pathways of conduction. The authors performed 2DE simultaneously with electrophysiologic induction of artrial and ventricular tachycardias (T) in 62 patients (pts) studied to identify and suppress symptomatic dysrhythmias. 2DE of one cardiac cycle each in normal sinus rhythm (NSSR) and the induced rhythm were analyzed frame-by-frame and digitized using prototype digital border terminal interfaced to a microprocessor. A computer procedure adapted from cineangiographic analysis, known as the center-line method (CL), identified 100 separate ventricular segments and plotted independent perpendicular motion from their positions at the peak of the QRS-R wave or the maximum diastolic dimension assessed visually. Contour plots were generated for the beats in NSR and T comparing motion of each segment through the cardiac cycle and scanned for sites of earliest activation and segmental changes in motion using each patient's normal heat as the control.

104006 Computer assisted analysis of backscattered ultrasonic signal for in vitro atherosclerosis detection. L.Landini, E.Picano, A.Benassi, A.Distante, A.L'Abbate (CNR Clinical Physiology Inst., Univ. of Pisa, Pisa, Italy).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.335-8
Establishes in vitro whether specific alterations in ultrasonic backscatter may characterize the atherosclerotic process, providing a quantitative assessment of severity. Two indices have been evaluated: one studying the transfer function (γ_1), the other measuring the integrated value of the FFT spectrum (IBI) of the signal. According to the results, backscattered signals seem to offer indicative parameters of changes in the arterial wall structure caused by atherosclerotic process. Therefore these results offer a clue to future studies for in vivo detection of atherosclerotic changes in superficial vessels. (6 refs.)

104007 The analysis of two-dimensional echocardiograms using a time-varying image approach. E.J.Delp, A.J.Buda, M.R.Swastek, D.N.Smith, J.M.Jenkins, C.R.Meyer, B.Pitt (Univ. of Michigan, Ann Arbor, MI, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.391-4
Discusses the use of dynamic scene analysis in automatic interpretation of two-dimensional echocardiograms. The approach is to process every frame of the cardiac cycle and use redundant information from previous frames to aid in finding features (primarily edges) in the current frame. The authors also discuss the use of preprocessing of the echo frames. Preliminary results of the design an edge detector algorithm using dynamic scene analysis is presented. Possible shape features for the measurement of cardiac status are presented. (15 refs.)

104008 Automated endocardial definition of 2-D echocardiograms: a comparison of four standard edge detectors and improved threshold techniques. D.T.Linker, A.S.Pearlman, T.K.Lewellen, L.H.Huntsman, W.E.Moritz (Div. Cardiology, Univ. of Washington, Seattle, WA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.395-8
Quantitative two dimensional echocardiography allows non-invasive determination of left ventricular volume, ejection fraction and regional wall motion from ventricular endocardial outlines. Accurate outlining by hand is tedious and difficult to perform repeatedly. To study the possibility of automating part of this operation, short axis views of the left ventricle in human subjects were digitized and transferred to an image processing system. Roberts, Sobel, Prewitt and compass edge detectors were applied to the images. Processing using the Ek algorithm and thresholding were also tested. Gain settings at the time of recording had an important effect on the results. Normal gain levels resulted in marked drop-out of borders oriented nearly parallel to the ultrasonic beam, while maximum gain levels produced spurious edges. An intermediate gain level gave the best results. All four edge detectors produced roughly equivalent results, but processing with the Ek algorithm produced the best results as judged by the lack of drop-out and spurious edges. (5 refs.)

104009 Automated computer enhancement and analysis of left ventricular two-dimensional echocardiograms. E.Garcia (Cedars-Sinai Medical Center, Los Angeles, CA, USA), A.Ezekiel, R.Levy, W.Zwehl, K.Ong, E.Corday, J.Areeda, S.Meerbaum, S.Corday.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.399-402
Describes development of automated image enhancement and age detection algorithms. Image are enhanced using space-time smoothing and dynamic range expansion. Space-time smoothing consists of a 27-point binary weighted pixel average. Dynamic range expansion consists of modifications of the gray level translational table and more recently of histogram equalization. Automatic edge detection of the endocardium is performed frame-by-frame by convolving a Laplacian operator with the enhanced images. The initial evaluation indicates that computerized enhancement and edge detection of 2D echocardiograms allows accurate analysis of LV cross-sectional areas and LV volumes, and offers important advantages of objectivity and speed. (7 refs.)

87.60D Electric and magnetic fields (d.c. and pulsed)

104010 SQUID biomagnetic measurements. D.E.Farrell (Phys. Dept. Case Western Reserve Univ., Cleveland, OH, USA), P.Zanzucchi.
CRC Crit. Rev. Solid State & Mater. Sci. (USA), vol.11, no.2, p.99-122 (1983).
Results obtained by measurement of the weak magnetic fields associated with organs in the human body have significant potential for a number of areas in the health sciences. A substantial amount of recent research activity has therefore been directed toward the goal of making biomagnetic measurements of useful resolution in an ordinary laboratory environment. For certain simple types of measurement the major problems have been solved and systems developed to the point of clinical usefulness. In other important instances, e.g. measurement of fetal brain activity, the goal has been approached but not yet attained. This review discusses both general principles and practical considerations involved in the optimization of a measurement system. Particular attention is given to the new area of biomagnetic susceptometry which has attracted considerable clinical interest. Specific examples of state of the art biomagnetic measuring systems are discussed and the potential for further improvement assessed. (61 refs.)

104011 Theoretical sensitivity of perivascular electromagnetic flowmeters deduced from the distribution of an applied inter-electrode potential. V.T.O'Sullivan (Nuffield Inst. for Medical Res., Oxford, England).
Phys. Med. & Biol. (GB), vol.28, no.8, p.973-81 (Aug. 1983).
A hypothetical electromagnetic blood flowmeter is considered in which the electrode system and the magnetic field are invariant in the direction of flow. If a voltage from an external source is applied between the electrodes, a potential distribution is produced on the outside of the vessel. It is shown that the sensitivity of the flowmeter to axisymmetric flow can theoretically be deduced from the potential distribution provided the vessel and blood have uniform, isotropic conductivities. The method, if applicable to practical flowmeters, would permit in vivo monitoring of flowmeter sensitivity. (10 refs.)

104012 Hyperthermia by magnetic induction: experimental and theoretical results for coaxial coil pairs. J.R.Oleson, T.C.Cetas (Div. of Radiation Oncology, Arizona Health Sci. Center, Tucson, AZ, USA), P.M.Corry.
Radiat. Res. (USA), vol.95, no.1, p.175-86 (July 1983).
High-frequency magnetic induction for producing elevated temperatures in human tumors can be accomplished with several electrode arrangements. The physical characteristics of a coaxial pair of electrodes or current loops placed on either side of the body are described. This electrode arrangement can improve the depth of power deposition within the body relative to that obtained with an electrode circumferentially encircling the body or a single surface applicator ('pancake coil'). Results are reported of measured and calculated magnetic field distributions and power density distributions obtained with a coaxial pair. The effect of varying load geometry upon the power density distribution was shown to be significant in several static phantom experiments. Electrode geometry was also important, as shown by calculations of power deposition as a function of electrode diameter in a simple model of body tissue conductivities. The power density was found to diminish at given depths as the electrode diameter decreased. Finally, values of magnetic fields were measured during treatment of human subjects with a coaxial electrode pair and were found to vary significantly from subject to subject. This resulted from variation in the geometry and electrical characteristics of tissues among subjects, and indicates the difficulty of formulating a standard accurate model for use with this magnetic induction technique. (22 refs.)

104013 Spectral irradiances of and maximal permissible exposures to two indirect ophthalmoscopes. J.Kossol (Non-Ionizing Radiation Lab., Pennsylvania Coll. of Optometry, Philadelphia, PA, USA), C.Cole, P.Dayhaw-Barker.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.616-21 (July 1983).
Recent reports in the literature have indicated that exposure to certain high intensity sources used in clinical procedures may be damaging to the retina. To investigate this problem, the spectral irradiance of two indirect ophthalmoscopes (American Optical (AO) and Keeler) was measured. The instruments do show operational differences, the most striking of which was the difference in the total irradiance produced at the maximum voltage setting, the Keeler instrument providing nearly 3.6 times greater irradiance than the AO indirect ophthalmoscope. The sources are evaluated as blue light hazards, and maximal permissible exposures (MBE) are calculated and compared to the MPE established by ANSI Z-136 guidelines. (12 refs.)

104014 A confrontation test of visual fields in the low-vision patient. R.Pace, J.G.Strong (School of Optometry, Univ. of Waterloo, Waterloo, Ontario, Canada).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.622-4 (July 1983).
Reports a simple method for measuring the extent of the visual field in patients for whom this measurement is difficult. One Maddox rod is used before the eye under test. Through the Maddox rod lens, this eye sees a white streak produced by a penlight. While fixating this white streak another penlight is brought into the field of view from the periphery. The patient is required to report only whether he sees one or two light streaks. The results correlate well with field measurements made on the tangent screen in patients with simulated field losses. (4 refs.)

104015 Thermometry in radiofrequency hyperthermia of malignant tumours. V.F.Lopatin, V.E.Klyuch.
Med. Radiol. (USSR), vol.28, no.7, p.29-32 (July 1983). In Russian.
The technical and methodological problems associated with intratissue and intracavitary thermometry in strong electromagnetic fields are discussed. The technical difficulties arise chiefly from the fact that the metallic conductors linking the thermosensitive elements act as receiving antennae of electromagnetic energy, which can create large errors in temperature measurement. Hence at the present time much effort is being devoted to the development and testing of contact thermometry techniques designed to reduce or eliminate electromagnetic interference between the electromagnetic field and the thermal sensors. The principles of some of these methods are described. In addition much work is being done on techniques of contactless thermometry, e.g. the use of infrared pyrometers. The development and introduction of high-precision methods of contactless intratissue thermometry should help to provide a more reliable and complete picture of the temperature distribution over the area of the body being examined. (10 refs.) *A.J.B.*

104016 Operator exposure to radiofrequency fields near a hyperthermia device. M.A.Stuchly, M.H.Repacholi, D.W.Lecuyer (Radiation Protection Bur., Health & Welfare Canada, Ottawa, Ontario, Canada).
Health Phys. (GB), vol.45, no.1, p.101-7 (July 1983).
Radiofrequency-induced hyperthermia has recently gained acceptance in cancer therapy. One of a few commercially available systems is the Magnetrode, a device operating at 13.56 MHz with an output power up to 1000 W. Heating of the prescribed part of the patient's body is accomplished by one of the coil electrodes. To assess exposure to the operator of the device, the intensities of the electric and magnetic fields in the vicinity of three Magnetrode coils were measured, while a human phantom or a human being was in the coil. Exposure to the device operator is compared with the recommendations of the Canadian safety code and the recent ANSI recommendations. (9 refs.)

104017 A method for the detection of amyloid in human tissue embedded in epon using a combination of polarizing light microscopy and electron microscopy. D.C.Cottell (Dept. of Pathology, Univ. Coll., Dublin, Ireland).
J. Microsc. (GB), vol.131, pt.1, p.119-25 (July 1983).
The method described uses a combination of congo red staining and polarizing microscopy. The method involves the removal of the embedding medium from semi-thin sections prior to staining with congo red and examination in the polarizing microscope. Typical apple green birefringence was detected in areas of amyloid deposition; these areas were mapped for selective trimming and ultra-thin sections taken serially were examined in the electron microscope. The method was found to be reliable, easy to use and particularly of value as a sampling procedure prior to investigation in the electron microscope. (22 refs.)

104018 Responses to 'Viewpoint: Lasers in Biomedicine'. J.A.Parrish (Wellman Lab., Massachusetts General Hospital, Boston, MA, USA), M.Wolbarsht, R.Goldstein, J.A.Dixon, T.Fuller, A.G.Doukas, R.R.Alfana, R.A.Guidi.
Laser Focus (USA), vol.19, no.8, p.57-9 (Aug. 1983).
Presents several responses from medical practitioners, researchers and laser manufacturers to an article by Michael W. Berns (see ibid., vol.19, no.6, p.66, 1983) in which forecasts and assessments were made for laser applications in biomedicine. (no refs.)

104019 Radiometer receivers for microwave thermography. D.V.Land (Univ. of Glasgow, Glasgow, Scotland).
Microwave J. (USA), vol.26, no.5, p.196-201 (May 1983).
Discusses microwave thermography which is the technique of measuring the natural thermal radiation from the human body in the microwave region. Describes a prototype radiometer system operating at 3.1 GHz. It is a single sideband superheterodyne with a 14 dB gain, 2.5 dB noise figure RF preamplifier. The IF amplifier has a bandwidth of 350 MHz, a noise figure of 2.5 dB and a gain of 46 dB. A tunnel diode detector is used and the radiometer modulation frequency is 1 kHz. A temperature resolution of approximately 0.1K is obtained for a response time of three seconds. (11 refs.)

104020 Colorimetric and cytophotometric investigation of an improved Papanicolaou staining procedure in cervical cells. A.Ruter (Univ. Wurzburg, Wurzburg, Germany), D.Wittekind, H.M.Aus.
Microsc. Acta (Germany), vol.87, no.3, p.245-69 (May 1983). In German.
The staining patterns of a modified Papanicolaou staining method and of its constituent procedures are compared with those from the common Papanicolaou method. The staining results are investigated by CIE-DIN-standardized color analysis. The medical investigator is able to discriminate more colors than this cytophotometric method, but this method is superior in the exact determination of colors. For neither of the Papanicolaou staining methods it is possible to indicate one or two wavelengths for cytophotometric measurement using narrow-band filters which allows an optimal automated separation of nuclei, cytoplasms and background of all cell types. This usual color analyzing method enables a better evaluation of the common Papanicolaou staining patterns. (12 refs.)

104021 Magnetic resonance in medical techniques: new possibilities. B.Dance.
Mundo Electron. (Spain), no.130, p.139-43 (July 1983). In Spanish.
Recent collaboration between physicists and medical investigators has led to the use of Nuclear Magnetic Resonance (NMR) techniques for producing images of the organs of living people without surgery. The new Topical Magnetic Resonance (TMR) technique is currently being developed with superconducting magnets for monitoring the energy-giving phosphate metabolism within living animals without taking fluid samples from them. These new techniques which employ radio frequency waves combined with magnetic fields and which are believed to cause no hazard to the patients are reviewed. (no refs.)

104022 Reconstructing NMR images from projections under inhomogeneous magnetic field and nonlinear field gradients. Ching-Ming Lai (Anologic Corp., Wakefield, MA, USA).
Phys. Med. & Biol. (GB), vol.28, no.8, p.925-38 (Aug. 1983).
Both inhomogeneity in the main magnetic field and nonlinearity in the gradient fields introduce errors in NMR images reconstructed from projections. It is found that the image artefacts caused by these two sources are separable. The inhomogeneous main field blurs the image while the nonlinear gradients distort the image. Firstly, blurring is removed by reconstructing the image curvilinearly in a coordinate system defined by the gradient fields. The distortions in the image are then corrected by taking an inverse coordinate transformation from the gradient-field coordinates to the spatial coordinates. Experiments performed by computer simulations are presented to demonstrate that, for the first time, accurate images can be found under large inhomogeneity and nonlinearity in the fields. Mathematical derivations and computational techniques are also described and discussed. (11 refs.)

104023 Monitoring variations of biological impedances using microwave Doppler radar. A.Thansandote, S.S.Stuchly, A.M.Smith (Dept. of Electrical Engng., Univ. of Ottawa, Ottawa, Ontario, Canada).
Phys. Med. & Biol. (GB), vol.28, no.8, p.983-90 (Aug. 1983).
A microwave Doppler radar for continuously monitoring time-varying biological impedances is described. The radar compares the phase of the signal scattered from a region of biological tissue with that of the transmitted signal. The phase changes of the scattered signal are an indication of the net impedance changes within the test region due to various physiological processes, e.g. the displacements of blood vessels during the cardiac cycle. A Doppler radar, equipped with a matched antenna, was tested with a simulation model and its detection characteristics was found to be a sinusoidal function of the antenna-object spacing. Tests with helathy human subjects were also performed at 3 GHz and 10.5 GHz. It was found that the 3 GHz Doppler radar has significantly greater penetration in tissues but is less sensitive to changes of the biological impedance than the 10.5 GHz system. (12 refs.)

104024 Permissible regimes of laser operation in medical applications. Yu.V.Afanas'ev, V.A.Isakov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.12-16 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.15-19 (1982).
It is shown that in operations in which damaged parts of biological tissue are removed, the applied laser fluxes should be sufficiently large to allow the participation of gas-dynamic processes in the interaction. In this case, the danger of thermal injury to the undamaged tissue is considerably lowered. (3 refs.)

How far does thermal damage extend beneath the surface of CO_2 laser incisions? .... See Entry 103796

NMR imaging [computerized tomography] .... See Entry 104106

(inc. X-rays and gamma-rays)

104025 Stepwise-control concept for the ray therapy of tumors. V.K.Ivanov.
Autom. & Remote Control (USA), vol.43, no.12, pt.2, p.1587-91 (Dec. 1982). Translation of: *Avtom. & Telemekh. (USSR)*, vol.43, no.12, p.105-10 (Dec. 1982).
An algorithm is proposed for the stepwise optimization of ray therapy which minimizes the survival of cancer cells in a set of admissible treatments for each irradiation. In case of unusual situations the cure may be interrupted. A set of programs for realizing this algorithm on a digital computer is described. (10 refs.)

104026 Radiation therapy and antitumoral immunity. The immunomodifying effects of ionizing radiation. V.B.Klimovich.
Med. Radiol. (USSR), vol.28, no.7, p.77-84 (July 1983). In Russian.
The results of numerous clinical and experimental studies on immunooncology are described, and their significance in regard to the interrelationships of the various factors in radiation therapy and antitumoral immunity is discussed. From examination of these results it may be concluded that immunological factors play a significant part both in the realization of the therapeutic effects of irradiation and also in restraining its effectiveness. Studies of the immunological aspects of oncology and radiology should therefore be directed towards the search for methods of controlling the immune reactions of an organism. Such an approach could reveal ways of increasing significantly the efficacy of radiology. (58 refs.) *A.J.B.*

104027 A computerized system for the elastic matching of deformed radiographic images to idealized atlas images. R.Bajcsy, R.Lieberson, M.Reivich (Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Comput. Assisted Tomogr. (USA), vol.7, no.4, p.618-25 (Aug. 1983).
A system of computer programs is described which, for the first time, is able to use computerized tomographic data to automatically locate, measure, and describe anatomical structures of interest with accuracy and consistency. Input to the system consists of any digitized radiographic data. Computer assisted tomographic (CAT) scans of the head were used in this first implementation. Using these data and a predefined atlas picture representing an idealized view of the average normal image, an individualized atlas was created. From the individualized atlas, structure size, density, location displacement, and distortion may be calculated. The individualized atlas created using high resolution data, such as the CAT scan, may then be directly superimposed on pictures obtained using lower resolution modalities, such as positron emission tomographic scan images. This allows the precise location of structures poorly visualized by the secondary imaging modality. This system is capable of using either two- or three-dimensional data. (12 refs.)

104028 Quantitative image reconstruction with weighted backprojection for single photon emission computed tomography. E.Tanaka (Div. of Phys., Nat. Inst. of Radiological Sci., Chiba-shi, Japan).

J. Comput. Assisted Tomogr. (USA), vol.7, no.4, p.692-700 (Aug. 1983).

The new method described is basically a filtered backprojection with some modifications. The algorithm consists of three steps: normalization of observed projections, modified convolution operation, and weighted backprojection. The weighting function for backprojection is determined to provide perfect attenuation compensation for a uniform attenuation medium and to keep the statistical noise in the reconstructed image low. The relative contributions of two conjugate projections to the image can be controlled by the reconstruction parameters, enabling improvement of the signal-to-noise ratio and spatial resolution at off-center area compared with the conventional averaging method of two conjugate projections. Simulation studies indicated that the method provides a satisfactory image for an extended source of ^{99m}Tc (μ=0.15 cm^{-1}) having a diameter of up to approximately 35 cm. A myocardium phantom is adequately reconstructed from a 180 ~225°C angle scan. The effect of nonuniform attenuation medium surrounding the source region can be corrected. This paper presents the mathematical basis of the procedure, the evaluation of the statistical noise, and some illustrative computer simulations. (23 refs.)

104029 Gold-195 m: new diagnostic possibilities in nuclear medicine with an ultra-short-lived radionuclide. J.Schneider.

Biomed. Tech. (Germany), vol.28, no.7-8, p.173-6 (July-Aug. 1983). In German.

195 m-Au with a half-life of 30.5 sec, and a gamma-energy of 261 keV is available from a generator system. The generator contains a sterile, pyrogen-free column, which is loaded with 195 m-Hg (half-life 41.6 hr). The generator is available in an additional lead casing as a bedside system. 195 m-Au obtained through a continuous decay of 195 m-Hg, is eluated with a sterile thiosulphate solution and applied to the patient in a small bolus. Clinical evaluation can be done in various projections and under various loading steps in 3- to 5-min.-intervals. (16 refs.)

104030 Mean transit time image—a new method of analyzing brain perfusion studies. Z.Szabo, F.Ritzl (Dept. of Nuclear Medicine, Municipal Hospital Wuppertal, Wuppertal, Germany).

Eur. J. Nucl. Med. (Germany), vol.8, no.5, p.201-5 (1983).

Point-by-point calculation of the mean transit time based on gamma fit was used to analyze brain perfusion studies in a vertex view. The algorithm and preliminary results in normal brain and in different stages of cerebral perfusion abnormality (ischemia, stroke, migraine, tumor, abscess) are demonstrated. In contrast to the traditional methods using fixed, a priori defined regions of interest this type of mapping of the relative regional cerebral perfusion shows more clearly the irregular outlines of the disturbance. Right to left activity ratios in the arterial part of the time-activity curves showed significant correlation with the mean transit time ratios (Q_t=1.185-0.192Q_a, n=38, r=0716, P<0.001). (43 refs.)

104031 Medium energy proton accelerator for therapy. B.Gottschalk (Harvard Cyclotron Lab., Cambridge, MA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3063 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The author presents the specifications for a small synchrotron making low-current adjustable-energy proton beams for radiotherapy, which is to be built within the next three years. (no refs.)

104032 Dual-energy Compton-scatter densitometry. A.L.Huddleston (Dept. of Radiology, Texas Tech. Univ., Lubbock, TX, USA), J.B.Weaver.

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.7, p.997-1002 (July 1983).

The determination of the electron density of a substance may lead to characterization of the structure and function of the substance. Medical applications of this assessment may provide useful information describing the status of human tissues, such as bone. The non-invasive method presented is the dual-energy Compton-scattering technique, which incorporates the determination of an effective attenuation coefficient for the substances under study. The theoretical considerations of dual-energy Compton scattering are presented, as well as the results of experiments using samples of materials of known electron density. The radionuclide gadolinium-153 provides two photon energies, 41 keV and 100 keV for the scatter measurements. This method is found to have an accuracy of 1-3%. (8 refs.)

104033 Iso-effect tables and therapeutic ratios for epidermoid cancer and normal tissue stroma. L.Cohen, M.Creditor (Dept. of Radiation Oncology, Michael Reese Hospital, Chicago, IL, USA).

Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1065-71 (July 1983).

Available literature on radiation injury to normal tissue stroma and ablation of epidermoid carcinoma was surveyed. Computer programs (RAD3 and RAD1) were then used to derive cell kinetic parameters and generate iso-effect tables for the relevant tissues. The two tables provide a set of limiting doses for tolerance of normal connective tissue (16% risk of injury) and for ablation of epidermoid cancer (16% risk of recurrence) covering a wide range of treatment schedules. Calculating the ratios of normal tissue tolerance to tumor control doses for each treatment scheme provides an array of therapeutic ratios, from which appropriate treatment schemes can be selected. (40 refs.)

104034 The simulation of electron beam therapy employing cone collimation. D.Jones (Northwest Medical Phys. Center, Seattle, WA, USA).

Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1097-8 (July 1983).

A simple device is described which is used to determine treatment distance and beam direction in electron therapy employing cone collimation. A technique for the production of irregular field templates and localization films is given. (no refs.)

104035 Characterization of laser-produced plasma X-ray sources for use in X-ray radiography. D.L.Matthews, E.M.Campbell, N.M.Ceglio, G.Hermes, R.Kauffman, L.Koppel, R.Lee, K.Manes, V.Rupert, V.W.Slivinsky, R.Turner, F.Ze (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

J. Appl. Phys. (USA), vol.54, no.8, p.4260-8 (Aug. 1983).

The authors report the absolute conversion efficiency ξ_x from the incident laser light energy to X-ray photons for the laser-produced plasmas. Potential X-ray backlighting (radiography) line sources having photon energies from 1.4 to 8.6 keV are studied as a function of laser wavelength, pulsewidth, and intensity. The laser intensity and pulsewidth range from 10^{14} to 10^{16} W/cm^2, 100 ps to 2 ns and include incident wavelengths of 1.06, 0.53, and 0.35 μm. The authors found that *K*-shell X-ray line emission ξ_x: (1) decreases with increasing X-ray energy, (2) decreases with increasing laser intensity, (3) decreases rapidly with pulselength, and (4) moderately increases with decreasing laser wavelength. On the contrary, for Au *M* band emission, at a fixed laser intensity and pulsewidth, ξ_x significantly increases (~25X) upon decreasing the laser wavelength from 1.06 to 0.35 μm. (14 refs.)

104036 The influence of scattered radiation on the CT numbers of bone on a scanner with a fixed detector array. R.P.Moran (Dept. of Radiation Oncology, McGill Univ., Montreal, Quebec, Canada), W.S.Y.Kwa, S.A.G.Chenery.

Phys. Med. & Biol. (GB), vol.28, no.8, p.939-51 (Aug. 1983).

A dependence of the CT number upon radial position of a bone plug in a unit density phantom is observed with a scanner employing a fixed detector array. The effect of the signal produced by scattered radiation from the phantom is analysed. A scatter correction consisting of a fixed fraction of the incident X-ray intensity is considered. The resultant error from such a correction is found to depend upon the ratio of the scatter to the primary detected intensities and is shown to be consistent with the observed results. (12 refs.)

104037 A study of image discrepancies due to object time-dependence in transmission and emission tomography. W.R.Ip, J.E.Holden, S.S.Winkler (Dept. of Medical Phys. & Radiology, Univ. of Wisconsin, Madison, WI, USA).

Phys. Med. & Biol. (GB), vol.28, no.8, p.953-62 (Aug. 1983).

In conventional computed tomography (CT) imaging of a point object, projection filtering causes the back-projected contributions to image positions away from the point to sum to zero. If the point object intensity is time-dependent, and all the projections are not acquired simultaneously, this cancellation cannot be complete and artefacts result. Loss of spatial invariance makes a general linear-system approach to the problem impossible. The authors have studied the properties of such artefacts by the computer simulation of decaying exponential time-dependence in three different spatial distributions and four transmission and emission CT geometries. Spatially complex time-dependent objects typically produce artefacts that can be treated as an additional broad-spectrum noise source with a power comparable to that of other CT noises. Artefacts from broad ranges of similar time-dependence can add coherently to cause patches of artefact, particularly in geometries with a strong correlation between projection acquisition time and projection angle. As expected, artefacts are reduced for all geometries as scan duration is reduced. In the authors' model, with a most rapid decay constant of 1.2 min^{-1}, negligible artefacts were observed for a six second scan duration. (8 refs.)

104038 The ramp injection of radiotracers for blood flow measurement by emission tomography. C.C.Duncan (Dept. of Pediatric Neurology, Yale Univ. School of Medicine, New Haven, CT, USA), R.M.Lambrecht, A.Rescigno, C.-Y.Shiue, G.W.Bennett, L.R.Ment.

Phys. Med. & Biol. (GB), vol.28, no.8, p.963-72 (Aug. 1983).

A prototype instrument based on the coincidence detection of annihilation radiation was built to control the arterial concentration of a radionuclide as a uniformly increasing ramp function over a preset injection interval (ranging from 1.6 min to 13.6 h). The device was designed to accommodate radionuclides of different physical and biological half-life, and the physiological characteristics of the system being studied. A kinetic model based on the Kety-Schmidt integral (1948) was developed to permit the determination of cerebral blood flow (CBF). Both the kinetic model and the ramp injector were tested in cats studied with the PETT III positron emission tomograph and 4-(^{18}F)-fluoroantipyrine as the CBF tracer. The ratio λ/f of the brain-to-blood partition coefficient (λ) and blood flow (f) were determined simultaneously by serial measurements with positron emission tomography. (22 refs.)

104039 Neutron radiography and autoradiography at the J. Stefan Institute. J.Rant, M.Copic, V.Dimic, R.Ilic, M.Najzer, G.Pregl ('J. Stefan' Inst., 'E. Kardelj' Univ. of Ljubljana, Ljubljana, Yugoslavia).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.281-90

At 250 kW TRIGA Mark II reactor in Ljubljana two different neutron radiographic facilities are constructed. One facility is primarily used for NR inspection of macroscopic objects, while the other is intended for microneutronography and neutron induced autoradiography. Neutron radiography was used in examination of abnormally elongated Al-clad TRIGA fuel elements and applied for few users in aircraft, chemical, ski and metallurgical industry. Experimental and theoretical study has been done, elucidating the role of back-diffused betas in imaging process with beta-emitting converter screens and the spatial resolution of radiographic techniques has been determined. A comprehensive and fundamental study of neutron radiographic and autoradiographic properties of various SSNTD-s is in progress. The applications of neutron induced autoradiography with SSNTD-s are presented. Ultra high resolution heavy charged particle relief autoradiography with gelatine as an imaging material was introduced. (54 refs.)

104040 The use of neutron radiography and microdensitometry in the study of instrumental effectiveness on dental tissue in the process of mineralization. J.M.Vulcain, J.Tamisier (UER d'Odontologie, Univ. de Rennes, Rennes, France), J.H.Espie, R.Masse, A.Laporte.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.555-63

Neutron-radiography is used as a non-destructive method of exposing the peripheral part of the root canal which, in the course of endodontic treatment, is to be removed by root therapy instruments. Samples are treated with an agent of contrast with high screen power for neutrons: gadolinium which is used in the form of a citrate solution, it slowly diffuses through non-mineralized structures and settles like the other rare earths on the interface of mineralized tissues and of those in the process of mineralization. This mechanism is on occasion controlled by the richness of proteoglycans in this tissue. Once the samples are saturated, a neutron-radiographic image is made, then analyzed by microdensitometry so as to obtain a quantitative parameter. After instrumentation of the samples, a new neutron-radiographic image, and a new microdensitometric analysis are made. The results thus obtained make it possible to quantify the effectiveness of the various instruments available for endodontic treatments. (26 refs.)

104041 Fast neutron radiography in biology and medicine. E.Duhmke, L.Greim (Radiological Clinic, Univ. of Kiel, Kiel, Germany).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.573-80

Fast neutrons are necessary for neutron radiography of extended biological objects. Applying cellulose nitrate foils to assure specific neutrograms undisturbed by X- and γ-ray effects, a multifoil stack can be used as detector in order to improve image quality and to reduce neutron dose down to less than 10 rem. Neutron radiography enables one to observe the exsiccation process in biological materials, e.g. wood, which could not be achieved by X-ray radiography. In medicine neutron radiography could be of value for detecting pathological changes within bone such as replacement of bone marrow by fat or tumor, as shown in human vertebral columns. (9 refs.)

104042 Digital radiography—some system design considerations. P.O.Scheibe (ADAC Lab., Sunnyvale, CA, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.2-11 vol.2
Constraints on design and realization of digital radiography (DR) systems are obtained from fundamental considerations. These considerations and other factors are illustrated by discussion of a DR system for fluorography. (6 refs.)

104043 Removal of streaking artifact in computed tomography. R.L.Morin (Dept. of Radiology, Univ. of Minnesota, Minneapolis, MN, USA), D.E.Raeside.
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.32-41 vol.2
In transmission Computed Tomography, relative X-ray attenuation measurements are made at various angles around a patient's body. These input projection data are reconstructed to yield a cross-sectional view of internal structure. If the body section contains material which severely attenuates the X-ray beam (e.g., surgical clips, lead fragments) high density streaks which obliterate internal structure will be produced in the process of image reconstruction. This loss of diagnostic information renders the scan useless. A technique has been developed which removes this imaging artifact. The approach views the affected projection data as misinformation. These data are assigned new values and image reconstruction is performed without changing existing computer hardware or software. Projection data for a head section containing a lead fragment were obtained by Monte Carlo simulation. Three methods of obtaining replacement data were examined. A nearest neighbor pattern recognition technique yielded excellent results. (36 refs.)

104044 The effect of noise in computed tomographic reconstructions on detectability. K.M.Hanson (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.67-70 vol.2
The detectability of features in an image is ultimately limited by the random fluctuations in density or noise present in that image. The noise in CT reconstructions arising from the statistical fluctuations in the one-dimensional input projection measurements has an unusual character owing to the reconstruction procedure. Such CT image noise differs from the 'white' noise normally found in images in its lack of low-frequency components. The noise power spectrum of CT reconstructions can be related to the effective density of X-ray quanta detected in the projection measurements, designated as NEQ (noise-equivalent quanta). The detectability of objects that are somewhat larger than the spatial resolution is directly related to NEQ. Since contrast resolution may be defined in terms of the ability to detect large, low-contrast objects, the measurement of a CT scanner's NEQ may be used to characterize its contrast sensitivity. (37 refs.)

104045 A digital X-ray image processing system for measurement of phasic blood flow in coronary arteries. P.Spiller, J.Jehle, B.Politz, F.K.Schmiel (Medizinische Klinik B, Univ. Dusseldorf, Dusseldorf, Germany).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.223-6
Densitometric evaluations of cineangiograms have shown that flow rates in coronary arteries can be determined from the propagation of contrast material (CM). The method is based upon the measurement of the transit time of the CM through a fixed distance of the vessel. As the temporal resolution of this technique is limited by the cine frame rate to 10 ms, a relatively high measurement error results, if the transit time amounts to only some 10 ms. To solve this problem a digital image processing system was developed by which the displacement of the CM during a fixed time interval is measured. The images of the cineangiograms are scanned by a video camera, A/D-converted (8 bit, 10.5 MHz) and buffered as a matrix in a fast semiconductor memory. Pairs of two consecutive cine frames are subtracted from each other in order to form a display which shows only the differences of the two analyzed frames. Thus the passage of the front of the contrast medium is visualized. From a series of difference images phasic flow velocities can be determined. The accuracy of this method to measure coronary artery flow was proved by comparison with photodensitometrically determined data. (4 refs.)

104046 Real-time study of cardiac functions. M.Kiri, K.Kume, I.Tanaka (Shimadzu Corp., Kyoto, Japan), J.Ohno.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.295-8
Presents new nuclear imaging system which enables the real-time monitoring of cardiac functions during exercise studies. The data from the gamma camera is collected in image mode about every 30 beats spanning the average cycle with fifteen to thirty 64×64 images. At the end of every 30 beats, the cardiac functional parameters such as the ejection fraction (EF), the heart rate (HR), the relative cardiac output (CO), and the relative end diastolic (ED) volume are calculated and displayed along with the averaged volume curve. This system is not a conventional minicomputer system but a LSI-based system, equipped with a large capacity LSI image memory and a powerful image processing hardware units. Now the physician can decide more precisely the extent of the exercise the patient can do, and he can acquire sufficient data for analysis. Moreover, sensitive and accurate analysis of the cardiac functions can be done, taking into account the observed states of the patient during the exercise study. (3 refs.)

104047 Using a gamma camera to follow left ventricular function during transient ischaemic attacks. M.Morgan, M.Croom, G.Davies, P.Crean, T.Pratt, W.Bencivelli, A.Maseri (Royal Postgraduate Medical School, London, England).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.299-302
Presents a system to follow changes in ventricular volumes during rapid haemodynamic transients using gamma camera imaging. Current ventricular function assessment by gamma camera (gated blood pool or first pass studies) does not allow the assessment of haemodynamic changes. The system uses a minicomputer to record data, in list mode, from the gamma camera, and to process them to obtain time activity curves beat by beat from regions of interest. A moving average over 21 beats allowed sufficient statistical accuracy to produce reliable data which accurately describes the sequence of ventricular changes without significant distortion of the signal. (4 refs.)

104048 Quantification of regional ventricular function with vector Fourier analysis of gated images. J.Machac, K.Miceli, S.F.Horowitz, M.Prior, S.J.Goldsmith (Div. of Cardiology, Mount Sinai Medical Center, New York, NY, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.303-6
A method of analysis of radionuclide cardiac gated blood pool studies is presented. Effective mean regional phase and amplitude summation vectors are obtained, using trisectional subdivision of the left and right ventricles. This system was applied to the analysis of timing abnormalities caused by left bundle branch block. Results for 6 normal subjects and 6 patients with left bundle branch block are presented. Timing differences between left and right ventricles as well as within each ventricle are demonstrated. This method offers a unified quantitative approach to the simultaneous analysis of both magnitude and timing abnormalities of myocardial contraction. (10 refs.)

104049 Improved quantitation of stress/redistribution TL-201 scintigrams and evaluation of normal limits. K.Van Train, E.Garcia, J.Maddahi, D.Brown, A.Waxman, J.Areeda, D.Berman (Cedars-Sinai Medical Center, Los Angele, CA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.311-14
To overcome problems associated with subjective interpretation of stress/redistribution Tl-201 scintigrams, the authors previously developed and validated a method for the quantification of Tl-201 myocardial distribution and washout. Improvements in this method have been to increase objectively by reducing operator interaction and the addition of a comprehensive final report form. Abnormality in this analysis is determined by comparing the patient's stress and washout profiles with normal limits statistically derived from a group of normal patients. Since the decision on which normal population to use is still controversial, an evaluation was made of two different 'normal' populations. From this evaluation an accurate definition of normal limits was established and these limits were incorporated into the analysis. (8 refs.)

104050 Analysis of regional function in radionuclide ventriculography: physiological signal, scintillation noise, and regional size. M.A.Douglas, J.J.Bailey, P.P.van Rijk, S.L.Racharach, R.O.Bonow, M.V.Green (Nat. Inst. of Health, Bethesda, MD, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.315-18
The left-ventricular region-of-interest (ROI) in 64 radionuclide ventriculograms was divided into radial sectors (2-, 3-, 4-, 6-, and 12-sectors/ROI). Time-activity curves (TACs) were derived globally (total ROI) and sectorially. The pointwise deviation of the TAC was used as a noise estimator and the amplitude of the first Fourier harmonic used as a signal estimator. The relationship of signal/noise ratios, so defined, to Fourier analysis is described. The results suggest strongly that the physiologic signal is largely contained in 4 harmonics and that higher harmonics relate to noise of various sources and should be suppressed. Filtering at 4 harmonics will improve the S/N ratio by 8-17 fold. It is also shown that the poorer counting statistics in regions smaller than 1/4 ROI degrade the S/N ratio in a high proportion of TACs; such TACs cannot be distinguished from background TACs in terms of S/N or harmonic content, and therefore cannot yield reliable parameters of regional myocardial function. (7 refs.)

104051 A new method for the temporal evaluation of ventricular wall motion from digitized contrast ventriculography. O.Ratib, A.Righetti (Cardiology Center, Univ. Hospital, Geneva, Switzerland), G.Brandon, L.Rasoamanambelo.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.409-12
Describes a new approach which permits an easy evaluation of the temporal sequence of regional ventricular wall motion from contrast cineangiograms. Phase analysis is applied for the assessment of the sychronicity of regional wall motion from the measurement of displacement of the ventricular endocardial edges instead of changes in density of each picture element. This technique can therefore be applied to images obtained either after peripheral or after conventional intraventricular injection. (9 refs.)

104052 External tandem target system for efficient production of short-lived positron emitting radionuclides. K.Koh, R.Finn, T.Wooten, J.Dwyer, Y.Sheh, J.Sinnreich (Cyclotron Facility, Mount Sinai Medical Center, Miami Beach, FL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3064-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Recent developments in radiopharmaceutical chemistry allow the incorporation of short-lived, positron-emitting radionuclides into a variety of compounds which when used with a positron emission tomograph provide a means of monitoring physiological disorders by a standard technique. To effectively meet the increased 'in-house' clinical demands while maintaining a production schedule, a tandem target was designed and has been installed for the simultaneous 'on-line' preparation of oxygen-15 labelled compounds such as CO_2^{15},

H_2O^{15}; and nitrogen-13 labelled compounds such as $^{13}NH_3$, $^{13}N_2O$, and $^{13}N_2$. The processing time required for the synthesis of the nitrogen-13 products as compared to the essentially instantaneous formation of oxygen-15 labelled compounds has provided the necessary time delay for clinical utilization. The characteristics of this external tandem target system as well as the automation for the dual processing is presented. (5 refs.)

104053 Development and use of the ^{195m}Hg-^{195m}Au generator for first pass radionuclide angiography of the heart. R.Bett (AERE, Harwell, Didcot, England), J.G.Cuninghame, H.E.Sims, H.H.Willis, D.S.Dymond, W.Flatman, D.L.Stone, A.T.Elliott.
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.7, p.959-63 (July 1983).
Describes the preparation and characteristics of a ^{195m}Hg-^{195m}Au generator for clinical use in first-pass radionuclide angiography of the heart. The generator has an efficiency of elution of 20-30% which is maintained over the whole of its useful life. Over 100 patients have taken part in clinical trials with the generator. (11 refs.)

87.60M Radiation dosimetry

104054 Recent results of the German Thorotrast study—dose relevant physical and biological properties of Thorotrast equivalent colloids. W.Riedel, A.Dalheimer, M.Said, U.Walter (Klinikum Steglitz, Freien Univ. Berlin, Berlin, Germany), A.Kaul.
Health Phys. (GB), vol.44, suppl.1, p.293-8 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
As a prerequisite for quantifying the nonradiation effect of Thorotrast, nonradioactive and radioactive aquasols with identical physicochemical properties and with biophysical behavior comparable to that of Thorotrast were developed and produced for a second long-term animal experiment. Comparative investigations with hafnium and zirconium (zirconotrast) dioxide aquasols showed the latter to be most appropriate considering the size of both the dispersoids and the aggregates in the liver tissue. The average particle diameters of ThO_2, ZrO_2 and HfO_2 proved to be values of 9.3 nm, 15 nm and 45 nm, respectively. Radioactive zirconotrast was prepared by radiochemical incorporation of ^{230}Th and ^{228}Th at dose rates which produce accumulated doses in the liver of rats equivalent to those of commercial ^{230}Th enriched Thorotrast after 1.5 yr. Five different colloids were prepared with α-energy emission rates increased by factors of 1, 2.5, 5, 10 and 25 compared to Thorotrast and then injected into rats. (6 refs.)

104055 Microdosimetry of plutonium in lungs. W.Hofmann (Div. of Biophys., Univ. of Salzburg, Salzburg, Austria).
Health Phys. (GB), vol.44, suppl.1, p.419-29 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Chord length distributions for alveolar cells and cell nuclei were determined by superimposing computer-generated α-particle tracks on magnified images of randomly selected rat lung sections using the Quantitative Television Microscope. Specific energy distributions were then calculated by applying image analysis techniques. These microdosimetric calculations suggest that radiation carcinogenesis can be described in physical terms by the number of cells hit in a defined tissue volume, the specific energy distribution in these cells, the resulting number of nonlethally damaged cells which are susceptible to transformation, and their spatial distribution. If multicellular effects are involved in radiation carcinogenesis, then hot spots might be more carcinogenic than the uniform distribution at low doses and less carcinogenic at high doses. (20 refs.)

104056 Distribution and dosimetry studies after incorporation of ^{239}Np (^{239}Pu) in mice. W.A.Muller, U.Linzner.
Health Phys. (GB), vol.44, suppl.1, p.577-80 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
4-week-old female NMRI mice were injected intraperitoneally with 6.5 mCi ^{239}Np per Kg body weight. The retention pattern over 336 hr is shown. About 50% of injected ^{239}Np was retained in the skeleton and 5% in the liver. Dose calculations were made for both ^{239}Np and ^{239}Pu (the daughter of ^{239}Np). A long-term experiment for osteosarcoma risk from ^{239}Np skeletal β-doses is also discussed. (11 refs.)

104057 Estimation of the genetically significant dose from diagnostic X-ray procedures in the Islamic Republic of Iran. M.Sohrabpour, N.P.Saheli, P.Zarsav, D.Reza Esmaeeli (Nuclear Res. Center, Atomic Energy Organization of Iran, Tehran, Iran).
Health Phys. (GB), vol.45, no.1, p.21-9 (July 1983).
The genetically significant dose from diagnostic X-ray sources has been estimated. Age and sex distribution was based on a survey of 13100 patients. Dosimetry was performed on patients and on an equivalent-man Rando phantom. Child-expectancy factors were estimated from the census results of fertility and mortality rates. The genetically significant dose value for the diagnostic procedures to the Iranian population was estimated to be 9.2 mrem/yr in 1980. (9 refs.)

104058 A suggested limit for population exposure to radiofrequency radiation. D.F.Cahill (Health Effects Res. Lab., US Environmental Protection Agency, Research Triangle Park, NC, USA).
Health Phys. (GB), vol.45, no.1, p.109-26 (July 1983).
In order to determine whether the current database was sufficient to support an interim determination of a limit for USA population exposure to radiofrequency (RF) radiation (0.5 MHz-100 GHz), a critical and comprehensive review of the available literature on the biological effects of RF radiation was recently completed. In the analysis of this data, a number of simplifying assumptions has to be employed; among them was the use of the specific absorption rate (SAR) as the mass-normalized, frequency-independent measure of RF energy input into biological systems. The biological effects reported in acceptable studies were assessed in terms of their associations with (1) core temperature increases, (2) SAR, (3) SAR as a percentage increase over resting metabolic rate, and (4) direct evidence for human effects. Based on information now available and analyzed from these four perspectives, a conservative SAR threshold value of approx. 0.4 W/kg is apparent. Since the unknowns and uncertainties are potentially significant, one might consider, from the standpoint of prudence, the further application of a safety factor of 10. Given the present state of knowledge, the resultant SAR limit of 0.04 W/kg is, in the author's opinion, unlikely to be associated with the adverse health effects in the general population. (138 refs.)

104059 Lung dose calculations using computerized tomography: is there a need for pixel based procedures?. J.Van Dyk (Phys. Div., Ontario Cancer Inst., Princess Margaret Hospital, Toronto, Ontario, Canada).
Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1035-41 (July 1983).
Radiotherapy of tumors within the thorax often requires radiation beams that traverse lung tissues. Not only do lungs consist of large volumes of low density tissues but, in addition, lung tissues are more radiosensitive than most other tissues. Computed tomography (CT) provides the detailed anatomic and geometric data ideally suited for accurate lung dose calculations. However, most radiotherapy centers do not have direct access to a CT scanner for planning purposes. In addition, it is argued by some that it is not necessary to use the CT pixel data directly for lung dose calculations but that it is sufficient to have the lung geometry outlined and to assume some average bulk density (not related to that specific patient) for the total lung volume. This study analyzes the potential errors in lung dose calculations when different lung density assumptions are made. The conclusions show that different levels of accuracy can be achieved with different levels of sophistication in lung density assumptions. However, the delivery of radiation absorbed dose to lung to an accuracy of 5% for all patients will require the detailed anatomical density data that are provided by CT. (18 refs.)

104060 Radium retention and dosimetry in the St. Bernard. R.D.Lloyd, G.N.Taylor, C.W.Jones, C.W.Mays (Radiobiology Lab., Univ. of Utah, Salt Lake City, UT, USA).
Radiat. Res. (USA), vol.95, no.1, p.150-7 (July 1983).
The percentage total-body retention (R) of ^{226}Ra was determined in 14 young adult St. Bernards for the first 4 years after injection to be represented by the equation, $R=34.8\ e^{-0.165t}+24.6\ e^{-0.00537t}+40.6\ e^{-0.000503t}$, where t is the time after injection in days. It was found that the ^{222}Rn/^{226}Ra ratio in the skeleton was similar to that measured previously for young adult beagles given ^{226}Ra. Excretion of injected ^{226}Ra averaged about 32% in the first 2 weeks, with about 2/3 of the total appearing in the faeces. St. Bernards appear to retain more ^{226}Ra than do beagles injected at the same age. The last two terms of the retention equation were used to calculate the average skeletal radiation dose rate and cumulative radiation dose normalized to each dog's individual retention measurements. Allowance was made in the calculations for the changing skeletal retention of ^{222}Rn and its radioactive daughters as a function of time. (25 refs.)

104061 Radiation doses from the transport of radioactive materials. K.B.Shaw (Nat. Radiological Protection Board, Chilton, England), B.Holyoak.
Radiol. Prot. Bull. (GB), no.53, p.8-11 (July 1983).
The transport of technetium generators for hospital use accounts for about 49% of the occupational exposure for the normal transport of radioactive materials. Other isotopes for medical and industrial use contribute about 38% of the occupational exposure and the remainder can be attributed to transportation as a result of the nuclear fuel cycle including the transport of irradiated nuclear fuel. The occupational collective dose for all modes of transport is estimated at 1 man Sv y^{-1} (100 man rem y^{-1}). (1 ref.)

104062 The exposure of the EC population from nuclear industry effluents. M.Broomfield (Nat. Radiological Protection Board, Chilton, England).
Radiol. Prot. Bull. (GB), no.53, p.23-7 (July 1983).
The collective dose commitment to the European Community (EC) population from routine effluents released from nuclear power stations and reprocessing plants within the Community in 1978 amounts to about 500 man Sv. Most of this is received within a few years of the discharge, while approximately 90 man Sv is delivered at very low dose rates over several thousands of years. The collective dose commitments associated with discharges from the nuclear power stations are small, in no case exceeding a few man Sv. Carbon-14. (4 refs.)

104063 Measurement techniques for radium and the actinides in man at the Center for Human Radiobiology. R.E.Toohey, A.T.Keane, J.Rundo (Radiological & Environmental Res. Div., Argonne Nat. Lab., Argonne, IL, USA).
Health Phys. (GB), vol.44, suppl.1, p.323-41 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Various techniques are employed to determine the amounts, retention, and distribution of radioactivity in human subjects in vivo. The principal method is γ-ray spectrometry with large NaI(Tl) scintillation crystals ('whole-body counting'). The geometries used include an arc of 1.5-m radius in which all parts of the body are roughly equidistant from the detector, a reclining chair and a flat bed with detectors placed above and below the subject. When a sufficient amount of radioactivity is present in a subject, scanning techniques assist in determining its distribution in the body. Specialized instruments such as xenon-filled proportional counter and a dual-crystal (phoswich) detector are used to measure low-energy photon emitters, primarily plutonium and americium. There are three primary methods of calibrating the detectors. The first is analytical, in which a rigorous mathematical treatment is employed; the second involves the administration of tracer amounts of radioactivity to human volunteers; the third consists of determining detector response to known amounts of radioactivity in a phantom. All three methods can be intercompared, and further evaluated by comparing the results of measurements in vivo with those of postmortem analyses. (81 refs.)

104064 Identification of ^{241}Am in the axillary lymph nodes with an intrinsic germanium detector. S.G.Graham, S.J.Kirkham (AWRE Aldermaston, Reading, England).
Health Phys. (GB), vol.44, suppl.1, p.343-52 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
A routine measurement with two 200 mm-diameter phoswich detectors, placed one each side of the sternum, yielded an apparent lung content of 17 nCi ^{241}Am for a subject. Inspection of the data revealed that there were many more counts from the left side than from the right and that there was greater number of Np L X-rays observed, relative to the Lγ-ray, than would be expected for a uniform lung distribution of ^{241}Am. These observations suggested a shallow localised deposit in the left side of the chest. The subject's working history could not rule out an inhalation exposure, but he was known to have had a wound contaminated with Pu/Am in his left hand 16 yr previously. The wound had contained approx. 0.02-0.03 μCi ^{241}Am initially, most of which was excised from the wound site after 50 days. Prompted by this knowledge the authors used a 50 mm-diameter intrinsic Ge detector to examine the wound and relevant lymph node sites. The results demonstrated a localised deposit of ^{241}Am in the axillary lymph node sites. The results demonstrated a localised deposit of ^{241}Am in the axillary lymph nodes with approx. 1 nCi ^{241}Am at the wound site. Subsequent measurements made with the phoswich detectors suggested that there was approx. 7 nCi ^{241}Am in the lymph nodes with approx. 1 nCi ^{241}Am in the liver, thereby accounting for most of the detectable ^{241}Am contamination in the thorax. (8 refs.)

104065 Uranium and thorium isotopes and their state of equilibria in lungs from uranium miners. M.E.Wrenn, N.P.Singh (Dept. of Pharmacology, Univ. of Utah, Salt Lake City, UT, USA), G.Saccomanno.
Health Phys. (GB), vol.44, suppl.1, p.385-9 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Radiochemical analysis of seven lungs obtained at autopsy show that concentrations ranged between 6 and 63 pCi/kg for ^{238}U and 6-66 pCi/kg, for ^{234}U. Similarly, ^{230}Th ranged from 17 to 54 pCi/kg, two orders of magnitude higher than ^{230}Th observed in the lungs of the general population from the Western mining region. For individual lungs, ^{238}U and ^{234}U were close to equilibrium with an average ratio of ^{238}U/^{234}U of 0.94 and a range of 0.80-1.02. Surprisingly, ^{230}Th was close to equilibrium with ^{234}U with a ^{230}Th/^{234}U ratio of 1.1 and a range from 0.54 to 2.6. Equilibrium between U and Th isotopes is in contrast to the disequilibrium reported in beagles which chronically inhaled carnotite, where the ^{230}Th/^{234}U ratio was observed to range from 5.4 to 7.4 with an average of 6.3. The average radiation dose rate to lung from each of the three radionuclides was calculated. The combined radiation dose rate (at death) due to three long-lived radionuclides ^{238}U, ^{234}U and ^{230}Th varied from 2.5 to 14.2 mrad/yr with a mean of 9.6 mrad/yr. The concentration of ^{226}Ra and daughters in the lung was not determined. (10 refs.)

104066 Fallout $^{239/240}$Pu and ^{238}Pu in human tissues from the Federal Republic of Germany. K.Bunzl, W.Kracke (Inst. fur Strahlenschutz, Neuherberg, Germany).
Health Phys. (GB), vol.44, suppl.1, p.441-9 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
To determine the present level of plutonium in human tissues of people in the FRG, due solely to fallout from weapons testing, 30 sets of tissues and bones from Munich residents were obtained at autopsy. Each set of tissues consisted of the entire lung, the entire liver, 300 g vertebrae, 300 g ribs and the lymph nodes. All subjects were males, born before 1940. Wet ashing, followed by solvent extraction, electrodeposition, and α-spectrometry were used to isolate and quantitate the plutonium isotopes present. The median concentrations of $^{239/240}$Pu (in fCi/kg wet weight) observed were: livers (530), vertebrae (92), ribs (73), lymph nodes (58) and lungs (28). The ratio of ^{238}Pu/$^{239/240}$Pu (in %) was livers 3.5, lungs 5.6, ribs 4.0 and vertebrae 3.2. Age trends for the plutonium concentration in livers, vertebrae and ribs were not observable. Possible correlations between the plutonium concentrations in livers, lungs and bones are discussed. The results are in many respects similar to observations in the USA and Southern Finland. (24 refs.)

104067 Actinides concentrations in human tissues. H.Kawamura, G.I.Tanaka (Div. of Radioecology, Nat. Inst. of Radiological Sci., Ibaraki, Japan).
Health Phys. (GB), vol.44, suppl.1, p.451-6 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Fallout, ^{239,240}Pu concentrations in some autopsy tissues from the general population in Japan are described. Body burden and relative distribution among tissues of plutonium were obtained by extrapolating using the mass of relevant tissues of the normal Japanese adult. ^{239,240}Pu-to-^{90}Sr body burden ratio was obtained. ICRP models were used to estimate body burden and relative contribution of ingestion intake. Need for data on the intraskeletal distribution of fallout plutonium and more information on gastrointestinal absorption in man was stressed. (18 refs.)

104068 Measured ^{234,238}U and fallout ^{239,240}Pu in human bone ash from Nepal and Australia: skeletel alpha dose. I.M.Fisenne, P.M.Perry, N.Y.Chuy (Environmental Measurements Lab., US Dept. of Energy, New York, NY, USA), N.H.Harley.
Health Phys. (GB), vol.44, suppl.1, p.457-67 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
Human bone samples from Nepal and Australia were analyzed for isotopic uranium and fallout plutonium. The Nepalese samples were obtained for a 3-yr period (1976-78) while the Australian samples are representative of a single year (1977). The surface air plutonium concentrations for the latitude bands of these countries were either measured and/or estimated from 1954 through 1978. With the plutonium air concentrations and age-dependent breathing rates as input data, the measured human bone results were compared with skeletal estimates derived from the ICRP Task Group Inhalation Model, and the agreement was found to be reasonably good. The measured isotopic uranium concentrations in these samples provide a benchmark against which to assess fallout plutonium based upon a comparison of the skeletal α radiation dose from a natural actinide to these populations. (30 refs.)

104069 Plutonium concentration in human tissues: comparison to thorium. N.P.Singh, M.E.Wrenn (Dept. of Pharmacology, Univ. of Utah, Salt Lake City, UT, USA), S.A.Ibrahim.
Health Phys. (GB), vol.44, suppl.1, p.469-76 (1983). (Proceedings of an International Conference on Radiobiology of Radium and the Actinides in Man, Lake Geneva, WI, USA, 11-16 Oct. 1981).
The concentration of ^{238}Pu and ^{239,240}Pu, and of ^{228}Th, ^{230}Th, and ^{232}Th were measured in 10 sets of human tissues from Washington, DC, and 12 sets from rand Junction, CO. The tissues were collected at autopsy by qualified pathologists from normal healthy persons most of whom died suddenly. The subjects had acquired plutonium from fallout of global nuclear testing and burnup of a space nuclear generator utilizing ^{238}Pu. The organ distribution pattern shows that most of the plutonium was accumulated in bone and liver with 54-60% in bone and 34-43% in liver. Only 3-6% was found in lung including lymph nodes; kidney, spleen, thyroid and gonads together contained around 1%. The analytical results show three major differences between plutonium and thorium concentrations and organ distributions: (1) for plutonium the liver is a major locus for storage ($\sim$40% of that found in the total body), whereas little thorium is accumulated in the liver (around 4%); (2) the relative amounts of ^{230}Th and ^{232}Th are much higher in lung and lymph nodes (10-28%) than currently for plutonium (3-6%); (3) the ratio of thorium concentrations in lymph nodes to lung is significantly higher than the ratio of plutonium concentrations in lymph nodes to lung showing thereby that fallout plutonium is more soluble than natural thorium. (25 refs.)

104070 Iodine-129 in mule deer thyroids in the Rocky Mountain West. O.D.Markham (Radiological & Environmental Sci. Lab., US Dept. of Energy, Idaho Falls, ID, USA), T.E.Hakonson, F.W.Whicker, J.S.Morton.
Health Phys. (GB), vol.45, no.1, p.31-7 (July 1983).
Thyroids from mule deer (Odocoileus hemionus) were collected in New Mexico, Colorado, Wyoming, and Idaho and ^{129}I/^{127}I atom ratios were determined. Iodine-129/127 atom ratios were significantly ($P<0.005$) different among states. Ratios in Wyoming and Idaho control thyroids were significantly ($P<0.05$) larger than ratios in New Mexico and Colorado. Fallout from past atmospheric nuclear tests at the Nevada Test Site is suggested as a possible explanation for the differences in ratios. Average ^{129}I/^{127}I ratios in thyroids of other large mammals collected 54 km west and 116 km northeast of the Idaho National Engineering Laboratory (INEL) in southeastern Idaho were up to 15 times those found in control thyroid samples from Idaho. Atmospheric effluents from the Idaho Chemical Processing Plant located on the INEL were likely responsible for the increased ratios in animals collected in the INEL vicinity. Although of no health consequence to the animals, ^{129}I in deer thyroids may be a sensitive indicator of contaminants from nuclear fuel reprocessing plants and atmospheric nuclear tests or accidents. (20 refs.)

104071 Retention of inhaled $^{238}PuO_2$ in beagles: a mechanistic approach to description. J.A.Mewhinney, J.H.Diel (Lovelace Biomedical & Environmental Res. Inst., Albuquerque, NM, USA).
Health Phys. (GB), vol.45, no.1, p.39-60 (July 1983).
Groups of beagle dogs received inhalation exposure to one of three sizes of monodisperse or a polydisperse aerosol of $^{238}PuO_2$. Periodic sacrifice of pairs of dogs through 4 yr after inhalation exposure provided data on the retention, translocation and mode of excretion of ^{238}Pu. Fragmentation of $^{238}PuO_2$ particles deposited in lung led to enhanced dissolution, translocation and excretion of ^{238}Pu compared to previous studies using $^{239}PuO_2$. A mechanistic simulation model was formulated to account for particle dissolution and fragmentation. This model provided adequate prediction of the time course of lung retention, uptake and retention in other organs and excretion. Predictions of the model provided more accurate description of the data than the Task Group on Lung Dynamics model incorporated in the ICRP Publication 30. The mechanistic model provided estimates of cumulative radiation dose to liver and bone that are a factor of five greater and to lung that are a factor of two less than predicted by the Task Group Lung Model. (32 refs.)

104072 Levels of ^{226}Ra, ^{210}Pb and ^{TOTAL}U in fish near a Saskatchewan uranium mine and mill. S.M.Swanson (Saskatchewan Res. Council, Saskatoon, Saskatchewan, Canada).
Health Phys. (GB), vol.45, no.1, p.67-80 (July 1983).
Reports experiments showing that radionuclide levels in fish from the Beaverlodge Lake area, Saskatchewan, Canada, varied significantly among lakes, species and tissues, but did not vary with fish sex or age. Fish from lakes affected by an operating uranium mine and mill had radionuclide levels one to two orders of magnitude above levels in fish from an uncontaminated control lake. Concentrations were greatest in white suckers, intermediate in lake whitefish, and low in lake trout. Skin and bone contained the highest radionuclide levels; levels in flesh were much lower. Bioconcentration factors varied among sites, species and tissues. The primary radionuclide transfer pathway appears to be via sediments, either through direct contact or through food organisms. Bottom-feeding species had the highest radionuclide levels while piscivorous fish had the lowest levels. The internal dose rate to noncontrol fish are comparatively low; any effects are likely to occur at the genetic level. (24 refs.)

104073 Radon-222 and progeny measurements in 'typical' East Tennessee residences. W.A.Goldsmith, J.W.Poston, P.T.Perdue, M.O.Gibson (Health & Safety Res. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Health Phys. (GB), vol.45, no.1, p.81-8 (July 1983).
Modified Wrenn chambers for continuous monitoring of ^{222}Rn, featuring several improvements including a computer-assisted electronics package, have been developed at the authors' institute. A field test of these instruments was conducted by placing them in the homes of staff members. Field testing was conducted in seven houses for periods ranging from 4 to 18 days. During this testing period, the ^{222}Rn concentration in these houses was monitored continuously. Radon-222 concentrations in the basements of three of the seven houses were in excess of 100 Bq/m^3 almost continuously. One residence had instantaneous concentrations approaching 1000 Bq/m/^{3}. Samples of soil and building materials from these residences indicated that ^{226}Ra concentrations were in the normal range (40 Bq/kg). Radon progeny measurements were made in five of these houses on a 'typical' day. Results obtained were as follows: for basements, a geometric mean of 0.016 WL (geometric SD of 2.9); for upper floors a geometric mean of 0.014 WL (geometric SD of 2.9). This paper summarizes the results obtained in the field test. (10 refs.)

104074 Assessments of the radiological consequences of postulated accidental releases from the Sizewell PWR. G.N.Kelly (Nat. Radiological Protection Board, Chilton, England).
Radiol. Prot. Bull. (GB), no.53, p.15-20 (July 1983).
Assessments have been carried out under contract to a number of organisations presenting evidence to Sizewell PWR enquiry which began at Snape Maltings in Suffolk, UK, in January 1983. These organisations are the Central Electricity Generating Board, the Nuclear Installations Inspectorate, the Greater London Council and the Friends of the Earth Trust. The main features of these assessments are summarised. (10 refs.)

104075 Site specific derived limits for stack discharges. J.Hallam (Nat. Radiological Protection Board, Chilton, England).
Radiol. Prot. Bull. (GB), no.53, p.20-3 (July 1983).
Deals with the procedure for estimating site specific derived limits for discharges of radioactivity into the atmosphere taking into account the conditions of the release and the location of the exposed population. The author considers: input parameters; calculation of basic parameters; calculation of a site specific derived limit. (2 refs.)

87.65 AERODSPACE BIOPHYSICS AND MEDICAL PHYSICS (EFFECTS OF ACCELERATIONS, WEIGHTLESSNESS AND ENVIRONMENT)

(see also 94.80 Aerospace facilities and techniques; space research)

104076 The significance of gravity on biological systems. A.H.Brown (Univ. of Pennsylvania, Philadelphia, PA, USA).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.3-9
Gravity is one of the three or four most important environmental factors that affect organisms. The author develops some thoughts which, if not altogether new, can be described in ways that may not have been heard before. In addition he recalls some early pioneering studies in space biology that contain lessons which ought not to be forgotten. He also introduces some novel ideas that may be found useful. (19 refs.)

104077 The Biorack. D.A.M.Mesland, A.F.L.Soons (Special Projects Div., ESA Tech. Directorate, Noordwijk, Netherlands).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.11-15
The Biorack is a multi-user-facility for research on small biological specimens in the microgravity environment of Spacelab. The units that constitute the Biorack, i.e. incubators, a cooler/freezer combined unit, a glovebox and various ancillary items are described, both from the functional and from the performance point of view. Biorack will first fly on the German D1 Spacelab mission, due for mid-1985. The experiments for this flight have been selected by ESA and a summary is given of the associated scientific research areas. (no refs.)

104078 Ground-based studies on gravitropism and on maximum yield of wheat. F.B.Salisbury (Plant Sci. Dept., Utah State Univ., Logan, UT, USA).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.17-19
There is a necessity for ground-based, fundamental research in support of and generation of ideas for space experiments. The author reviews a few highlights from his studies, mostly those relating to the gravitropic responses of higher plants, particularly leafy dicot stems. (6 refs.)

104079 A method to record the circadian rhythm in a unicellular green algae under extraterrestrial conditions. D.Mergenhagen (Inst. fur Allgemeine Botanik, Hamburg, Germany).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.21-4
Since it is still an open question whether an endogenous timer (a 'physiological clock') or so far unknown external timers (=zeitgebers) drive the circadian rhythm in living organisms, the observation of a free-running circadian rhythm under conditions free of terrestrial zeitgebers could help to prove the existence of an endogenous clock. The photoaccumulation behavior of the green algae Chlamydomonas reinhardii is subjected to such a circadian rhythm. A device is described to study the rhythm in this organism on board of the Space Shuttle. Preliminary results with miniaturized test cuvettes show that the observed rhythm does not differ from rhythms obtained with the laboratory standard test system. (4 refs.)

104080 How to prove the sensivity of plants towards gravity?. D.Volkmann, A.Sievers (Botanical Inst., Univ. of Bonn, Bonn, Germany).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.25-6
The sensitivity of organisms towards external stimuli, e.g. light, chemicals or gravity, is one main problem of stimulus perception and response. In the case of gravity, data concerning the sensitivity are provided only very incompletely by experiments using clinostats. Therefore it is proposed that the graviperceiving system of plant roots should be investigated under microgravity in space. The approach considered is to correlate the data of response kinetics with the ultrastructure of the graviperceiving cells. (6 refs.)

104081 Effects of space environmental factors on cell proliferation. H.Planel, R.Tixador, G.Gasset, G.Richoilley, J.C.Bes (Lab. de Biologie Medicale, Faculte de Medecine, Toulouse, France).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.29-31
CYTOS experiments, performed aboard the Soviet orbital station Salyut 6, have shown that exposure to space environmental factors results in an increase in cell growth rate, cell volume and cell water content. Changes have been also reported in protein and electrolyte content. The respective roles of microgravity and cosmic rays, in these responses, will be investigated using, in the BIORACK, cultures exposed to zero g or placed in a 1g centrifuge. (13 refs.)

104082 Growth and differentiation of Bacillus subtilis at microgravity. H.J.Rhaese (Inst. fur Mikrobiologie/Molekulare Genetik, Univ. Frankfurt, Frankfurt/Main, Germany), P.Schiller.
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.33-6
The purpose of Biorack experiment 28D planned for the D1 mission is to investigate the effect of prolonged microgravity on growth and differentiation (sporulation) of the prokaryote Bacillus subtilis. Short generation times (about 25 min) and remarkable sizes of population (10^8-10^9 individuals) allow one to study the effect of this very important physical factor on proliferation in 10 and more generations. Likewise, the influence of microgravity on spore formation, especially on asymmetric septum formation, a typical differentiation assocated event observed at the beginning of sporulation, can be studied in large populations (10^8-10^9). Growth will be monitored by optical density measurements and differentiation by electron microscopic studies (after the end of the mission) using samples fixed with glutaraldehyde at different stages of sporulation. (9 refs.)

104083 Effects of low gravity on mammalian cell polarization at the ultrastructural level. M.Bouteille, M.Gregoire, F.Bard, C.A.Bourgeois, A.M.Dupuy-Coin, D.Hemon, G.Geraud (Lab. de Pathologie Cellulaire, Paris, France).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.41-3
The purpose of the authors' experiment is to investigate the possibility that weightlessness induces changes at the ultrastructural level of the cell and at its metabolism. By means of ultrastructural three-dimensional and stereological methods, a search for such changes will be done in highly polarized, suspended plasma cells. The experiments will take place in the Biorack of Spacelab. (8 refs.)

104084 The problem of long-term function of neutrophils in studies on the effects of gravity on motility, shape and structure of locomotor cells. A.Zimmermann, H.U.Keller, H.Cottier (Inst. of Pathology, Univ. of Bern, Bern, Switzerland).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.45-8
Polarisation and locomotor responses of neutrophil granulocytes decrease with storage time at 4°C and preincubation at 37°C. Maintenance of these functions could not be improved by increasing the buffer capacity of the medium, addition of vitamins, pyruvate and nonessential amino acids or dihydroxybenzoic acid, or by lowering the cell concentration. (6 refs.)

104085 Graviperception, mitotic activity and cell differentiation in lentil seedling roots. G.Perbal, N.Darbelley, D.Driss-Ecole, G.Salle (Lab. de Cytologie et Morphogenese Vegetales, Univ. Pierre et Marie Curie, Paris, France).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.49-52
The gravity sensing cells of lentil roots are located in the center of the root cap. They contain voluminous amyloplasts which can move under the influence of gravity. In vertically oriented roots, these organelles lie on large aggregates of endoplasmic reticulum, the role of which is not well understood. When the roots are placed horizontally, bending occurs. This is due to an asymmetry of growth of the upper and lower sides of the stimulated roots. Mitotic activity and cell differentiation in roots appear to be influenced by the mechanism of graviperception. The space experiment proposed will therefore analyse the role of the endoplasmic reticulum-amyloplasts complex in the perception of gravity and the effects of microgravity on cell differentiation and meristematic activity in lentil roots. (31 refs.)

104086 Physarum polycephalum: contraction behavior, direction and velocity of protoplasmic streaming in near weightlessness. V.Sobick, I.Block (Deutsche Forschungs- und Versuchsanstalt fur Luft- und Raumfahrt eV, Cologne, Germany).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.53-6
To investigate the open question of whether cells are sensitive to acceleration stimuli, the authors propose a Biorack experiment with the slime mold Physarum polycephalum. The experiment is based upon the clinostat results: 1. A significant, but transient, decrease in the strand's radial activity period duration occured during Og simulation; 2. The velocity of the protoplasmic streaming (shuttle streaming) increased up to the termination of the Og simulation. To analyse these reaction under microgravity conditions in Spacelab a special hardware has been developed. It mainly consists of sub sample containers (SSC), a glove box microscope combined with a photodiode system (for measuring the strand's radial activity) and a cine camera (for registration of the velocity and direction of the shuttle streaming). After the mission the experimental data will be evaluated in the authors' laboratory. (7 refs.)

104087 Experiment A08/32/CH: 'effect of spaceflight on lymphocyte activation'. A.Cogoli, A.Tschopp (Lab. fur Biochem., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206), Cologne, Germany, 9-11 March 1983 (Noordwijk, Netherlands: ESA 1983), p.57-61
In the experiment proposed lymphocytes in blood samples withdrawn from the flight crew prior, during and after flight will be exposed to the mitogen Con A and cultured in-vitro. Cell proliferation, protein biosynthesis, ultrastructure and other biological parameters will be determined. The objectives are: a) biomedical, i.e. the adaptation of the immune response to the stress of spaceflight; b) basic research, i.e. the differentiation of cells cultured at low-g; c) biotechnological, i.e. methods for bioprocessing in space will be tested. The hypothesis that low-g depresses lymphocyte activation whereas high-g has a stimulatory effect will be challenged. Two other related experiments will be performed on Spacelab: 1ES031 on S1-1 and 240 on S1-4. (16 refs.)

Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206) .... See Entry 98659

87.70 BIOMEDICAL ENGINEERING

104088 Muscle function test device for measuring forces in the region of the angle joint. K.-W.Beste (Zentrum Radiologie, Medizinischen Hochschule Hannover, Hannover, Germany).
Biomed. Tech. (Germany), vol.28, no.7-8, p.168-73 (July-Aug. 1983). In German.
Strong ankle joint musculature is necessary for walking. Therefore in testing a patients walking capability, the force during dorsal flexion and plantar flexion should be measured in addition to the blood flow in the lower leg. For that purpose a muscle test device was designed on which the patient is placed in a flat position on a movable couch. The patient treads against foot-sheets which are connected with two measuring devices made of aluminium alloy (30×350×120 mm). Four strain gauges are fixed onto each of these sheets measuring the forces exerted by the pressure of the sole (plantar flexion) and the opposite tension (dorsal flexion). The resistance variations of the strain gauges are determined with an electronical indicating device including a bridge circuit, sample-hold technique and a digital voltmeter. The measuring sheets were loaded with calibration weights. A linear relation between weight and indicated digital value of the strain gauges was found in the range 0-250 kg. (37 refs.)

104089 Removal of eye movement and ECG artifacts from the non-cephalic reference EEG. C.Fortgens, M.P.De Bruin (Dept. of Neuropsychiatry, Psychiatric Centre Rosenburg, Hague, Netherlands).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.90-6 (July 1983).
A method is described that automatically eliminates eye movement artifacts from EEG records and creates an extracranial reference electrode in one single process. The usefulness of this method is illustrated for both standard EEG recording as well as for CNV and P300 potentials. The artifact signals are measured with a special set of electrodes and are combined in order to subtract the artifacts from contaminated EEG records. The subtraction ratios, are determined as those that minimize the variance in the resulting corrected EEG signal. (26 refs.)

104090 Spike detection based on a pattern recognition approach using a microcomputer. P.Guedes de Oliveira, C.Queiroz (Dept. of Electronics, Univ. of Aveiro, Aveiro, Portugal), F.Lopes da Silva.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.97-103 (July 1983).
A system for the detection of spikes and sharp waves in EEGs of epileptic patients is described. The system uses a pattern recognition technique and it is implemented in a hybrid microcomputer. It performs the on-line simultaneous analysis of 4 EEG channels and thus it is appropriate for long-term EEG recording. The performance of the system was considered satisfactory when compared with that of a panel of electroencephalographers. (26 refs.)

104091 Elimination of EMG interference during recording of somatosensory evoked potentials elicited by posterior tibial nerve stimulation in patients with cervical spinal cord injury. P.L.Perot,Jr., C.L.Vera, E.L.Fountain (Dept. of Neurological Surgery, Medical Univ. of South Carolina, Charleston, SC, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.104-9 (July 1983).
Recording somatosensory evoked potentials (SEPs) to posterior tibial nerve stimulation in some patients with acute injuries of the cervical spine can be difficult due to the presence of involuntary activity of the neck and jaw muscles. The electrical potentials derived from this myogenic activity have a distribution along the sagittal line of the head which is uniform in amplitude while the amplitude of the SEPs recorded from points along this sagittal line is maximal over a point close to the vertex and less in front and behind this point. This fact has been utilized to devise a 'bipolar' derivation with one electrode on the vertex and two electrodes, one in front and one behind it on the sagittal line tied together as a reference. This effectively eliminates potentials of muscle origin from the SEP record. Other 'bipolar' combinations are not as effective in obtaining evoked potentials free of this muscle interference. (10 refs.)

104092 A dedicated microcomputer-based instrument for interval analysis of multicomponent wave forms in single fibre EMG. G.R.Davis, I.T.Brown, M.S.Schwartz, M.Swash (Dept. of Electrical & Electronic Engng., Queen Mary Coll., London, England).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.110-13 (July 1983).
Describes a self-contained microprocessor-based instrument compatible with conventional EMG equipment for the analysis of multicomponent single fibre EMG waveforms suitable for single operator use. Intervals between four components of a motor unit action potentials can be analysed using three types of threshold or window triggers. The amplitude, duration and polarity of each of these triggers can be varied independently. The instrument is portable and useful in the clinical setting. (2 refs.)

104093 Quantification of spindles in comatose patients. G.Pfurtscheller, G.Schwarz, B.Pfurtscheller, W.List (Dept. of Computing, Tech. Univ. of Graz, Graz, Austria).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.56, no.1, p.114-16 (July 1983).
Quantification of spindles in comatose patients is easily possible by measurement of ERD (event-related desynchronization). ERD can either be positive (e.g. alpha blocking or alpha attenuation) or negative (spindle activity within the alpha band) or can be missing. Follow-up measurements in a comatose patient demonstrate the different time courses of VEP (visual evoked potential) and ERD during clinical recovery. That means that VEP and ERD are generated by different neuronal systems as reactions to the same external stimulus. (9 refs.)

104094 A new head-mounted lip-jaw movement transduction system for the study of motor speech disorders. S.M.Barlow, K.J.Cole, J.H.Abbs (Speech Motor Control Labs., Univ. of Wisconsin-Madison, Madison, WI, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.283-8 (June 1983).
A new head-mounted lip and jaw transduction system is described, which features (a) an ultra-low mass tubular aluminum headmount mainframe with a unique coupling apparatus, (b) a low mass transducer unit, (c) nonrestraint of the head, and (d) a transduction artifact of .1 mm or less under most recording conditions. The importance of observing labial and mandibular movements in addition to electromyographic and aerodynamic signals is emphasized by reference to actual recordings of speech from subjects with neuromotor disorders. (21 refs.)

104095 The assessment of the post-thrombotic limb by foot volumetry and pedal venous pressure. J.N.Amoore (Dept. of Biomedical Engng., Univ. of Cape Town Medical School, Observatory, Cape Town, S Africa), L.B.van Oudenhove, E.Immelman, P.Jeffery.
J. Med. Eng. & Technol. (GB), vol.7, no.4, p.180-5 (July-Aug. 1983).
Various tests, such as foot volumetry, static and ambulatory venous pressure measurements, Doppler flow recordings and calf plethysmography, have recently been developed to aid and to attempt to quantify venous insufficiency. This paper describes a simple device for measuring foot volume changes during the prescribed exercise. The foot is placed in a water-bath and the change in foot volume is recorded by a strain-gauge pressure transducer. The transducer responds to the head of water change, which, in turn, is directly proportional to the volume change. Also described is a simple device for the measurement of pedal venous pressure using a standard, commercially available transducer. The methodology of the tests is discussed, together with sample results. (7 refs.)

104096 Analysis on diagnostic criteria of pediatric ECG. J.Hosaki (Tokyo Medical & Dental Univ., Tokyo, Japan), M.Okuni, S.Kusakawa, C.Mori, K.Hayakawa, S.Honda, K.Kitada, K.Yamauchi, S.Ito.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.281-4
By use of an automatic ECG analysis system, 78 measurements of the ECGs of 3136 healthy Japanese children aged between 3 and 18 were examined for differences due to age and sex. The examination has revealed that the amplitudes of R waves and S waves in the left precordial leads of children aged 12 and over are lower for girls than for boys. It is desirable, therefore, to improve for aplication to computer analysis, the Japanese diagnostic criteria of left ventricular hypertrophy for girls of 12 years of age and over. (5 refs.)

104097 On-line monitoring of multiple precordial leads in high risk patients with coronary artery disease. R.V.Essen, R.Hinsen, R.Louis, W.Merx, J.Silny, G.Rau, S.Effert (RWTH Aachen, Aachen, Germany).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.349-52
A computerized on-line monitoring system was designed and realized for monitoring up to 16 ECG-leads simultaneously. The aim is to detect ischemia early enough in order to protect ischemic myocardium from necrosis. The results of the first application in 50 patients with acute (n=40) or impending infarction (n=10) are presented. The patients were monitored between 24 and 48 hours (mean 35.5 hours). Using an 'averaging' technique ECG signal quality was excellent. The computer program for the evaluation of Q- and R-wave amplitudes and ST-segment elevation or depression and elimination of ectopic beats worked without any problems. The total period of monitoring was 1772.5 hours. During this time 21 ischemic attacks could be documented. All attacks were accompanied by angina and none was asymptomatic. The duration of ischemia ranged from 15 to 40 minutes. Several attacks could be stopped immediately by therapy. (5 refs.)

104098 Beat-to-beat analysis of waveshape and rhythm in XECG using inner vector product hardware. J.A.van Alste, E.D.Luursema, H.E.P.Cruts, O.E.Herrmann (Twente Univ. of Technol., Enschede, Netherlands).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.355-8
The on-line computer processing of electrocardiograms obtained from elderly patients exercising on a rowing ergometer should include both beat-to-beat analysis of the waveshape and of the cardiac rhythm, in spite of the sometimes strong baseline noise and myopotentials distorting the ECG signals. This noise can be reduced using algorithms including extensive convolution and correlation operations. These algorithms are implemented on a small computer extended with a specially designed device for the calculation of inner vector products. The basic information for the analysis of waveshape and rhythm is also extracted from the ECG in real time. (3 refs.)

104099 The design and evaluation of a real-time arrhythmia monitoring algorithm. J.Y.Wang, M.N.Shaya, E.D.Helfenbein, D.M.Sullivan, M.R.Kramer, A.D.Forbes, H.B.Jimison (Hewlett-Packard Co., Waltham, MA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.363-6
A new arrhythmia detection and identification algorithm has been developed for use in intensive and coronary care units. The design employs digital filtering of the ECG signal and a combination of template matching and feature extraction techniques for beat classification. Three separate studies were performed to evaluate the new design using both annotated digital data bases and longterm analog ECG recordings. A total of 348 hours of ECG from 311 coronary care and ambulatory patients were included. The results of these studies are presented using statistical histograms and scatter diagrams. (6 refs.)

104100 Three dimensional graphic display of cardiac motion abnormalities in myocardial infarction. K.Tamura (Dept. of Medicine, Yamanashi Medical School, Yamanashi, Japan), M.Okada.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.417-20
In order to recognize the occurrence of cardiac motion abnormalities in myocardial infarction, three dimensional graphic display (3-D) of cardiac motion was performed by Cardiomoveogram (CMG). CMG was developed in the laboratory based on the principle of electromagnetic body motion measurement. The non-contact and noninvasive probe was used. (1) The precordial CMG mapping was performed similarly to precordial ECG mapping technique. Altogether 49 records were obtained. In computer memories, digitized CMGs were arranged in a synchronized time base. Collecting the same points in time of these CMGs, 3D-CMGs were produced. (2) In healthy persons, the cardiac motions by 3D-CMG were comparable to physiological movement of

the heart. (3) In myocardial infarction, 3D-CMG clearly showed the occurrence of dyskinetic motion of the heart in extent and severity. (3 refs.)

104101 On the analysis of ambulatory long-term blood pressure recordings. N.Saranummi, J.Heinila, S.Kalli, M.Koskela, R.Poramo (Medical Engng. Lab., Tech. Res. Centre of Finland, Tampere, Finland), V.Turjanmaa, A.Uusitalo.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.425-8
Ambulatory long-term recordings of the intra-arterial blood pressure from the brachial artery can be made using a pressure transducer-perfuser unit connected to a FM tape recorder. The technical performance of this combination has been measured and it is shown that it fulfils the necessary requirements for a high quality registration and replay system of the blood pressure signal. The system has been used to gather material on the normotensive behaviour of the long-term blood pressure. Work is now continued with selected patient groups to assess their characteristic blood pressure pattern. The long-term records are analyzed with a VAX 11/780 computer and plotted with a digital plotter. (7 refs.)

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

104102 Differentiation of epileptiform abnormalities from normal transients and artifacts on ambulatory cassette EEG. J.S.Ebersole, S.L.Bridgers, G.Cloe, R.Silva (Dept. of Neurology, Yale Univ., New Haven, CT, USA).
Am. J. EEG Technol. (USA), vol.23, no.2, p.113-25 (June 1983).
Ambulatory cassette EEG (A/EEG) is gaining in popularity as an aid in the diagnosis of epilepsy and its differentiation from other causes of episodic alteration in consciousness. A study to clarify and codify rules of differentiation in the hope that the current widening use of A/EEG will be accompanied by appropriate interpretive accuracy is reported. It is concluded that artifacts and normal transients can be recognized on A/EEG, and should be appreciated but not feared. What is to be feared, given the current state of the art and science of ambulatory monitoring, is the over-zealous interpretation of equivocal events. Conservatism should be the watchword in A/EEG interpretation. A false-negative interpretation will not rule out a diagnosis of epilepsy, but a false-positive reading may inappropriately and unfortunately rule it in. (20 refs.)

104103 Frequency difference and amplitude difference pattern analysis of the electroencephalogram. S.Yoshimori, Y.Takashima (Course of Electrical Engng., Osaka Univ., Osaka, Japan), H.Takeda, S.Hata.
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.217-23 (1982).
The frequency difference and amplitude difference pattern analysis system which processes EEG signals recorded from right and left occipital sites is described. This analysis is a unique method. A preliminary experimental result concerning normal men at rest with the eyes closed and open indicates that the patterns of alpha band may be classified into three types. This method may be used for detecting the abnormal EEG. (7 refs.)

104104 A micro-computer system for cell electrophoresis measurements. R.A.Belcher (Dept. of Electrical & Electronic Engng., Univ. Coll. of Swansea, Swansea, Wales).
Radio & Electron. Eng. (GB), vol.53, no.7-8, p.283-6 (July-Aug. 1983).
Experimental measurements of the velocity of blood cells have been used in research into the early detection of cancer in patients. These measurements have been made by manually timing cells moving across a television screen. This technique is tedious, involves the timing of over a hundred cells and is therefore subject to error. A low-cost microcomputer system was designed to automate the measurement of cell velocity in order to give faster and more accurate results. (5 refs.)

104105 A solution of the ECG inverse problem based on the solid angle model. H.Ohsawa, K.Abe, H.Takeda, K.Maehara, Y.Ishiki, Y.Shimizu, T.Takishima.
Rec. Electr. & Commun. Eng. Conversazione Tohoku Univ. (Japan), vol.52, no.1, p.11-17 (June 1983). In Japanese.
According to the solid angle or electric double layer model of the electrical activity of the heart, ischaemic ST segment deflections of the electrocardiogram are determined by the geometry of the ischaemic region. A solid angle approach to obtain the solution to an important class of ECG inverse problems is presented. Assuming the knowledge of the geometry of the heart and the electrode sites, the present method can estimate the ischaemic regions on both the epicardial and endocardial surfaces from the ST segment deflection data on the body surface. The usefulness is illustrated by its application to an experimental model using the excised canine heart, where the heart is fixed in a tank filled with physiological saline and the electrodes are located on the latticed cylinder surrounding the heart. (7 refs.)

104106 NMR imaging [computerized tomography]. K.Satoh, K.Kose.
Solid State Phys. (Japan), vol.18, no.2, p.101-10 (Feb. 1983). In Japanese.
The theoretical basis and mechanics of NMR imaging are explained. The Fourier, projection and revolving system imagers are outlined. An NMR-CT facility designed by the authors is described. It consists of a maximum 1500 Oe Golay coil with a 1D scan or 350 mm×100 mm 2D scan yielding 10^{-5} degree equality, an interface, TOSBAC 7/40 microcomputer with memory, CRT display and array processor. Detailed data of saturation recovery images and practical images are shown. The scanner has been utilized for diagnostic purposes. (24 refs.) *M.O.*

104107 ECG criteria for left ventricular hypertrophy: use of ECG and echo computerized databases. L.E.Teichholz, N.R.Greenspan, D.LeBlanc, M.E.Goldman, M.H.Swartz (Div. of Cardiology, Mount Sinai Medical Center, New York, NY, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.277-80
The diagnosis of left ventricular hypertrophy using standard electrocardiographic criteria suffers from a lack of sensitivity. Echocardiographic measurement of left ventricular mass has been shown to correlate with autopsy data. The authors use the RISS data base system with echocardiographic and electrocardiographic data bases, the latter generated using the Marquette 12SL computer EKG system to analyze EKG criteria of left ventricular hypertrophy. Using left ventricular mass of 215 grams as cut-off for left ventricular hypertrophy, standard EKG criteria yielded sensitivities from 6 to 31%, specificities from 82 to 99% and accuracies from 51 to 56%. The criteria used for computer assisted interpretation had slightly better sensitivity (44%) and accuracy (64%) but the diagnosis of left ventricular hypertrophy still remains a significant problem. Further work is proceeding using multivariant analysis to improve criteria. The authors believe that the approach to improvement of EKG criteria for the diagnosis of left ventricular hypertrophy requires the analysis of a computer based data base generated by merging large EKG and echo data bases. (10 refs.)

104108 Manual vs. computerized electrocardiographic measurements of the P-wave: the diagnosis of left atrial enlargement. L.E.Ginzton, J.Floro, M.Laks (Harbor-Univ. of California Los Angeles, Medical Center, Torrance, CA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.289-92
The advent of computerized electrocardiographic interpretation has resulted in the routine measurement of a large number of electrocardiographic waveform parameters including amplitude, duration, slopes, and area to which diagnostic criteria may be applied. Unfortunately, there are few studies that have validated computerized measurements the P-wave with manual measurements. Therefore, the purpose of this study is: 1. to correlate manually derived electrocardiographic P-wave measurements with two-dimensional echocardiographic left atrial volume index and, 2. to compare these manual P-wave measurements with computerized measurements. (4 refs.)

104109 Automated vectorcardiographic analysis by an inexpensive microprocessor. K.Yamauchi (School of Medicine, Nagoya Univ., Nagoya, Japan), M.Yokoi, N.Okamoto, Y.Mizuno, T.Iwatsuka, N.Kitagawa, K.Sano.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.429-32
Based on a 15-year experience with computerized electrocardiology, the authors have developed an inexpensive, compact microcomputer system for vectorcardiographic analysis. Diagnostic accuracy of this system was tested on 2722 vectorcardiograms (VCGs) including various abnormalities. Sufficient results were obtained in most diagnostic categories. A more accurate interpretation of VCG by this system will be expected from updating the software. (4 refs.)

87.70G Patient care and treatment

104110 Substantiation of local hyperthermia in radiation therapy. A.N.Dedenkov, O.K.Kurpeshev.
Med. Radiol. (USSR), vol.28, no.7, p.84-8 (July 1983). In Russian.
The use of local hyperthermia for reinforcing the effectiveness of radiation therapy of oncological patients is discussed, with reference to the data of many clinical and experimental investigations of this combined treatment. It is concluded that local hyperthermia is a very promising technique in the radiation therapy of malignant tumours. However, its wide use in clinics is conditional on the solution of certain technical problems, particularly the methods of heating and temperature measurement, and also on the results of continuing study of the damaging action of hyperthermia on various tissues, both independently and in conjunction with irradiation. (no refs.) *A.J.B.*

104111 Thermal characterization of electrosurgery. T.S.Neiman, B.Dunn (Dept. of Materials Sci. & Engng., Univ. of California, Los Angeles, CA, USA), J.E.Flocken.
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.93-101 (1983).
The volumetric heating response of soft tissues to electrosurgical cutting and coagulation was studied. A series of experiments was conducted with thermistor probes embedded in a surrogate medium during controlled application of the electrosurgery current. A series of temperature profiles was obtained for various thermistor probe locations. These temperature profiles were found to be linear, exponential, or double exponential, depending upon the probe-incision distance. Temperatures next to the site of tissue destruction approached 70°C, within 2 seconds of application of power. Temperature changes due to lateral heating were an order of magnitude greater than temperature changes directly under the incision. Anisotropic heat conduction was observed for muscle fibers oriented in different directions. (6 refs.)

104112 Restoration of upper extremity function. P.H.Peckham (Case Western Reserve Univ., Cleveland, OH, USA).
IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.3, p.30-2 (Sept. 1983).
Functional neuromuscular stimulation has been shown to be a viable means of providing controlled movements in paralyzed limbs. Low levels of electrical current are effective in eliciting impulses in nerves, which then propagate to and result in a contraction of the muscle. The FNS technique encompasses many aspects of the physical and biological sciences. When properly performed, electrical stimulation can be applied effectively for extended periods of time with no significant detrimental effects to the tissue. The muscle contractions that result can be graded in strength and will fatigue minimally with time. Several clinical applications of FNS to paralyzed patients have been investigated. The technique has demonstrated its viability in applications to both the upper and the lower limbs in patients sustaining a variety of neurological diseases, including stroke, cerebral palsy, and spinal cord injury. This technique promises to be an important adjunct to clinical care in the future. (5 refs.)

104113 The treatment of scoliosis using electrical stimulation of muscle. M.A.Herbert (Hospital For Sick Children, Toronto, Ontario, Canada).
IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.3, p.43-9 (Sept. 1983).
Electrical stimulation is being used throughout the world in the treatment of scoliosis. The results suggest that it is a suitable alternative to the brace. The relative advantages of the RF system and surface stimulation have yet to be clearly defined. The author discusses: animal experimentation; electro-spinal stimulation; an electro-spinal orthosis; lateral electrical surface stimulations; electro-spinal instrumentation. (20 refs.)

104114 Design of a dedicated heavy ion accelerator for radiotherapy. R.Gough, J.Alonso, T.Elioff, J.Fugitt, A.Garren, H.A.Grunder, H.Lancaster, R.Sah, B.Sorensen, J.Staples, R.Yourd (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3067-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new heavy ion accelerator facility for radiotherapy is being designed at the Lawrence Berkeley Laboratory. Performance requirements have been established. Ions from helium to argon can be accelerated to a maximum energy of 800 MeV/nucleon with intensities in the range 10^8-10^9 particles per second. The accelerator subsystems consist of a linac injector, a synchrotron and a beam delivery system. Specifications have been developed for many of the technical components, and some details of the technical design are presented. (8 refs.)

104115 'Thermal mapping' in experimental cancer treatment with hyperthermia: description and use of a semi-automatic system. F.A.Gibbs,Jr. (Div. of Radiation Oncology, Univ. of Utah Medical Center, Salt Lake City, UT, USA).
Int. J. Radiat. Oncology Biol. Phys. (GB), vol.9, no.7, p.1057-63 (July 1983).
The regions of tumor which are least adequately heated during experimental hyperthermia treatments will most likely determine the ultimate probability of tumor control. Temperature inhomogeneity during local or regional hyperthermia is often marked, and stationary temperature probes yield very little information about the adequacy or inadequacy of tumor heating. Fine catheters can be placed through the tumor bearing region and temperatures recorded at various points within these catheters, thus yielding valuable data about temperature variations within the volume of interest. The 'thermal mapping system' (TMS) described provides a method for remotely sampling these temperature variations in a semi-automatic manner in several catheters simultaneously. Its application in conjunction with a commercial hyperthermia system is described and clinical examples of its use and importance are provided. (3 refs.)

104116 Recognition of ventricular fibrillation, other rhythms and noise in patients developing the sudden cardiac death syndrome. F.K.Forster, W.D.Weaver (Univ. of Washington, Seattle, WA, USA).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.245-8
Cardiac rhythms in 206 patients receiving emergency cardiac care including treatment for cardiac arrest were analyzed for the presence or absence of ventricular fibrillation (VF). The power spectral density of the electrocardiographic signal was determined. VF detection is based on a measure of relative power in particular frequency bands and other discrimination techniques applied to high and low frequency components plus harmonic peaks. 103 of 141 VF records (73%) were correctly indentified; 134 of 135 records (99%) of rhythms other than VF were properly discriminated (predictive accuracy=99%). The very low incidence of false positives makes the method suitable for development of safe automatic external VF detectors requiring minimal or no skilled human interaction. (8 refs.)

87.70J Prosthetics and other practical applications

104117 Laboratory evaluation of commercial aspheric aphakic lenses. D.A.Atchison, G.Smith (Dept. of Optometry, Univ. of Melbourne, Parkville, Australia).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.7, p.598-615 (July 1983).
Four types of commercial aspheric aphakic lenses were assessed with respect to mass, spectacle magnification, off-axis power errors, and peripheral distortion. The aspheric lenses have better distortion and off-axis imagery properties than spherical flat back lenses, but the improvement in distortion properties is small for those lenses whose design form specifies a flattish back surface. The claims concerning the distortion properties of these lenses are exaggerated. The shape (bending) of lenses has a large effect on spectacle magnification, peripheral distortion, and off-axis imagery. (9 refs.)

104118 The cortical hearing aid. C.R.Schafer.
DB Sound Eng. Mag. (USA), vol.17, no.5, p.35-8 (May 1983).
Discusses the cortical hearing aid, an instrument that apparently enables the stone deaf to understand speech and enjoy music. (8 refs.)

104119 Analysis of residual stress in failed T-28 femoral stems. R.D.Stroud, S.A.Brown, J.F.Shackelford (Univ. of California, Davis, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.13-20 (1983).
Retrieved stainless steel (Type 316L) T-28 femoral stems occasionally exhibit cracks on the medial surface. Since this region is loaded in compression during gait, a simple fatigue fracture explanation is not sufficient to account for these cracks. It has been suggested that they are related to residual stress. It is known that residual stress can contribute a large part of the strain energy near a crack tip. Four failed T-28 femoral stems have been analyzed after surgical retrieval. All of them had multiple visible cracks on the medial side in the region 2-5 cm distal to the calcar collar. All had failed by transverse fractures connecting with a crack on the medial side. These stems have been examined for residual stress by X-ray diffraction methods; significant levels of residual stress were found to be present in the sections tested. Stresses in the transverse direction (medial to lateral) were found to be strongly tensile near the lateral edge and changed to compressive near the medial edge. The area in the center of the sections was found to have nearly zero residual stress. (13 refs.)

104120 Effect of healing on small internal diameter arterial graft compliance. R.White, L.Goldberg, F.Hirose, S.Klein, P.Bosco, R.Miranda, J.Long, R.Nelson, E.Shors (Univ. of California Los Angeles Medical Center, Torrance, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.21-9 (1983).
The effects of healing on the compliance of small internal diameter vascular replacements were investigated. The compliance was correlated to the patency rate. It is concluded that differential ingrowth of a vascular prosthetic matrix has important long term functional significance. By directing the ingrowth of

the graft wall with fibrohistiocytic tissue, short term compliance remains similar to autogenous artery. (9 refs.)

104121 A new femoral component design based on the trabecular systems of the proximal femur. M.A.Gomez, S.L.-Y.Woo, R.C.Coutts (Div. of Orthopaedic Surgery & Rehabilitation, Univ. of California, San Diego, La Jolla, CA, USA).
Biomater. Med. Devices & Artif. Organs (USA), vol.11, no.1, p.39-50 (1983).
Presents a new design of the femoral component used in total hip arthroplasty. The design utilizes a tensile component which screws into the femoral stem from the lateral side of the femur. Two dimensional, plane stress finite element models of the proximal end of a normal femur, a femur with the new implant design, and a femur with a control Charnley-Cobra femoral component were developed. Loads simulating a one-legged stance were applied on the models. The normal and shear stresses, the octahedral shearing stress and the directions of principal stress were calculated for comparison with the normal femur. There was distinct improvement in bone stress distribution for the femur with the experimental implant as compared to the femur with the control prosthesis. The stress concentration normally observed in the mid-shaft area of the Charnley femoral stem was also not seen in the new design. (19 refs.)

104122 Stress analysis of a simplified compression plate fixation system for fractured bones. E.J.Cheal, W.C.Hayes, A.A.White,III (Dept. of Orthopaedic Surgery, Charles A. Dana Res. Inst., Boston, MA, USA), S.M.Perren.
Comput. & Struct. (GB), vol.17, no.5-6, p.845-55 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
A three-dimensional finite element model was generated of a plexiglass tube with an attached six-hole stainless steel compression plate to study the mechanics of internal fixation of fractured long bones. To demonstrate the importance of the plate-bone interface, this interface was represented three different ways in the finite element model. A plated tube with a uniform transverse osteotomy gap was also examined to study the mechanics of plated fractured bones. To validate the model, the results for the intact plated tube were compared to composite beam theory and strain gauge data from an instrumented physical model. Applications of the finite element model data included the prediction of screw failure modes, plate-induced osteopenia, and multiaxial strains in an interfragmentary region. (26 refs.)

104123 Control of movements by functional neuromuscular stimulation. P.E.Crago (Case Western Reserve Univ., Cleveland, OH, USA).
IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.3, p.32-6 (Sept. 1983).
Feedback is being designed into future functional neuromuscular stimulation orthoses to provide some of the functions normally provided by the nervous system. This article describes the types of feedback being considered and, in particular, the research being done on automatic feedback control systems to compensate for the nonlinear and time varying properties of muscle. (19 refs.)

104124 Performance characteristics for hearing aid microphone versus telephone and telephone/telecoil reception modes. J.C.Tannahill (Illinois State Univ., Normal, IL, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.195-201 (June 1983).
Two hearing aids and three telephone receivers were used to compare electroacoustic and word intelligibility data for hearing aid microphone reception versus telephone/telephone and telephone/telecoil reception. Measurements included test reference position gain and frequency response characteristics and word intelligibility scores. The results indicated that performance was similar for hearing aid microphone reception and telephone/telephone reception. Telephone/telecoil performance varied, depending on which telephone receiver was involved, but was poorer than hearing aid microphone performance. Recommendations were made concerning the selection of hearing aids and the management of hearing aid users relative to telephone/telecoil communication. (15 refs.)

104125 Biomechanics of the through-knee prosthesis. J.Hughes (Nat. Centre for Training & Education in Prosthetics & Orthotics, Glasgow, Scotland).
Prosthet. & Orthotics Int. (Denmark), vol.7, no.2, p.96-9 (Aug. 1983).
The biomechanics of the through-knee prosthesis is considered in detail and comparisons made with the above-knee case. Socket shape and suspension are discussed and comment offered on knee function in both stance and swing phases. (4 refs.)

104126 Recent developments in aids for profoundly deaf children. F.A.Saunders (Smith-Kettlewell Inst. of Visual Sci., San Francisco, CA, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.28/3/1-5
The author describes continuing research with an electrotactile sensory aid for profoundly deaf children. The aid displays acoustic information on the skin of the abdomen, via a belt of electrotactile stimulators. The resulting tactile patterns provide cues for recognizing environmental sounds; enhance the accuracy of lipreading, and permit the child to monitor his own speech in comparison with the speech of others. The tactile patterns generated by specific sounds must be learned, much like acquiring a second language; substantial training and experience is required in order to obtain significant benefits in speech reception and speech production. Plans for a miniaturized, fully wearable aid and for computer-aided instruction are discussed. (6 refs.)

104127 Speech synthesis for the speech impaired. M.R.Barker (Rehabilitation Engng. Center, Children's Hospital at Stanford, Palo Alto, CA, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.28/5/1-4
The author discusses speech synthesis in terms of its suitability as a communication aid for the speech impaired. By considering the total communication system, the effectiveness of any communication aid can be evaluated. The needs and capabilities of the user, the environment and the device characteristics are assessed. For speech synthesis as an output of a communication aid, intelligibility and availability are considered and some developments in speech output communication aids briefly mentioned. Speed of communication in real-time is identified as a problem yet to be solved. (8 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

104128 Echocardiography application in experiments on small laboratory animals. A.Krajewski, T.Wroblewski (Dept. of Pathophysiology, Inst. of Physiological Sci., School of Medicine, Warsaw, Poland).
Acta Physiol. Pol. (Poland), vol.33, no.5-6, p.661-4 (Sept.-Dec. 1982).
Rabbit heart echocardiograms were compared with autopsy measurements for assessing the accuracy of this non-invasive method in small animals. The correlation coefficient of these measurements was 0.72 for $p<0.01$. Additionally, the site of ultrasound probe application for heart visualisation from the left and right side of the chest was determined. It is stressed that the rules accepted for echocardiographic investigations in man must be applied with caution and criticism to the animals because of the different shape of the heart and chest wall. (2 refs.)

104129 Linear electron accelerator used to study the radiobiological effects of high doses of fast electrons. V.G.Videnskii, V.V.Gordeev (Sci. Res. Inst. of Medical Radiology, USSR Acad. of Medical Sci., Obninsk, USSR).
Radiobiologiya (USSR), vol.23, no.3, p.419-21 (1983). In Russian.
In order to study the early biological effects of whole-body and partial exposure of biological objects to high doses of fast electrons a simple and reliable method has been developed for the purposes of the control and correction of the dose-rates. Measurements were made of the spatial distribution, in air and water, of the doses used for irradiation of laboratory animals and cell suspensions with the nonuniformity coefficients indicated. (2 refs.)

104130 Fast neutron beam formed at the isochronous cyclotron U-240, and study of its dosimetric characteristics. E.E.Chebotarev, V.N.Bukanov, Yu.F.Kataevskii, N.A.Tkachenko, Ya.I.Serkiz (R.E. Kavetsky Inst. of Oncology Problems, Ukrainian Acad. of Sci., Kiev, Ukrainian SSR).
Radiobiologiya (USSR), vol.23, no.3, p.421-5 (1983). In Russian.
Gives a description of the channel equipped for radiobiological experiments with fast neutrons at the isochronous cyclotron U-240. A study made of some dosimetric characteristics of a mixed γ-and-neutron beam is reported. (6 refs.)

104131 Analysis and synthesis of bird vocalizations: an FFT-based software system. C.Clark (Field Res. Center, Rockefeller Univ., Millbrook, NY, USA), R.J.Dooling, T.Bunnell.
Behav. Res. Methods & Instrum. (USA), vol.15, no.2, p.251-3 (April 1983). (12th National Conference on the Use of On-Line Computers in Psychology, Minneapolis, MN, USA, 1982).
An FFT-based software package has been designed and implemented in order to analyze and synthesize bird vocalizations. The system is flexible so that screen editing can be performed on either the original waveform or the Fourier coefficients of the transform. The edited coefficients of selected notes, syllables, or songs are stored for later modification or combination with other song components to compose entirely new songs. These analyses and synthesis methods have proved to be extremely useful in the elucidation of birds' perceptive capabilities and the biological significance of their songs. (6 refs.)

104132 Cause of the drift of the zero point of the visual polarimeter. V.Ye.Zhvirblis.
Biophysics (GB), vol.27, no.4, p.783-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.4, p.744-7 (1982).
According to the author's observations the positions of the zero points of visual half-shaded polarimeters of the SM-1 type determined from the light transmission maximum of the polarizer-analyser system ($\alpha_{\max}$) experience complex periodic drift which has been explained by the action on the instrument of a certain exogenous physical factor (V. Zvirblis, Khim. i. zhizn', no.12, p.42, 1977). Recently, Burdin and Sizov (Bifizika, vol.26, p.368, 1981) advanced the assumption that this drift is caused by variations in the threshold of visual adaptation of the operator resulting from the effects of particular endogenous and/or exogenous factors. The author feels that there are quite cogent grounds for considering that during observations of drift of the zero point $\alpha_{\max}$ of the visual polarimeter by the 'fork' method a quite independent effect operates and the variations in the thresholds of visual adaptation contribute only to the experimental error. (8 refs.)

104133 A localized pattern photobleaching method for the concurrent analysis of rapid and slow diffusion processes. D.E.Koppel (Dept. of Biochem., Univ. of Connecticut Health Center, Farmington, CT, USA), M.P.Sheetz.
Biophys. J. (USA), vol.43, no.2, p.175-81 (Aug. 1983).
A scanning pattern photobleaching method for the analysis of lateral transport is described and discussed. Fluorescence bleaching with a localized pattern allows for the concurrent analysis of motions over two very different characteristic distances: ξ_0^{-1}, the repeat distance of the pattern, and W, the linear dimension of the illuminated region. The former motion is deduced from the decay of the modulation amplitude (of period ξ_0^{-1}) of fluorescence scans with the attenuated pattern, the latter from the recovery of the average fluorescence intensity. Such analysis should prove useful for the study of samples with a wide range of diffusion coefficients, and for the separation of effects arising from lateral diffusion and association dynamics. Theoretical analyses are presented for three related problems: (*a*) the effect of pattern localization on the decay of the modulation amplitude, (*b*) the effect of the pattern modulation on the recovery of the average local fluorescence intensity, and (*c*) the effect of a limited diffusion space (with linear dimensions of only a few pattern periods) on the decay of the modulation amplitude. (36 refs.)

104134 Phospholipid bilayers made from monolayers on patch-clamp pipettes. R.Coronado, R.Latorre (Dept. of Physiology & Biophys., Harvard Medical School, Boston, MA, USA).
Biophys. J. (USA), vol.43, no.2, p.231-6 (Aug. 1983).
Phospholipid bilayers were made from phospholipid monolayers at the air/water interface on patch-clamp pipettes. Lipid bilayers were characterised using the K^+ carrier nonactin and the channel formers gramicidin and alamethicin. Bilayers were also formed from monolayers spontaneously assembled in a suspension of native vesicles from cardiac sarcolemma and lobster axonal membranes and an excess of lipids. In these types of bilayers the authors observed several different channels including one contained in the axonal membrane that shows delayed rectifier behaviour. This technique permits the study of reconstituted channels on a time scale and noise comparable to cellular patch-clamp standards. (23 refs.)

104135 Teflon insulation for metal microelectrode shafts. C.J.Robinson (Rehabilitation R&D Center, Hines VA Hospital, Hines, IL, USA), H.Burton.
J. Electrophysiol. Tech. (GB), vol.10, no.2, p.75-9 (1983).
A method is described for applying multiple coats of Teflon insulation to the shafts of glass-insulated metal microelectrodes by using relatively standard laboratory equipment. This insulation has proven to be quite durable even when the electrodes have been used to make repeated transdural penetrations into monkey or cat cortex through an Evarts type chronic recording chamber. (5 refs.)

104136 Peripheral nerve fiber group separation in evoked potential research using cooling and polarization. R.K.Simpson,Jr., J.G.Blackburn, H.F.Martin, S.Katz (Dept. of Physiology, Medical Univ. of South Carolina, Charleston, CA, USA).
J. Electrophysiol. Tech. (GB), vol.10, no.2, p.81-92 (1983).
A method for peripheral nerve fiber group separation was applied to a primate model used in somatosensory evoked potential research. Cooling of the radial nerve employing a Peltier biothermode in combination with anodal polarization was utilized to separate A beta and A delta fibers from C fibres. The technique was verified using a pauci-fiber preparation. Applications of this new technique include the study of peripheral nerve and spinal cord injury in humans as monitored by evoked potentials. Selectively, repeatability, little temporal dispersion and no tissue damage are properties of this technique. (31 refs.)

104137 BAK instruments DIS-1 window spike discriminator. K.G.Buahin, W.Z.Rymer (Northwestern Univ., Medical School, Chicago, IL, USA).
J. Electrophysiol. Tech. (GB), vol.10, no.2, p.93-6 (1983).
The BAK Electronics Inc., Model DIS-1 window discriminator in a handy device that is used in electrophysiological experiments to separate single-unit spikes that exhibit unique temporal and amplitude characteristics from a recording of multi-unit extracellular activity. It is useful because it enables investigation of single-unit firing patterns without the need to further isolate the unit, a procedure which may be either inappropriate or impractical under many experimental conditions. The discriminator allows one to open a variable electronic window, bounded by time and amplitude, on a unique portion of the single-unit spike of interest. After the recording has passed through the discriminator all spikes not lying in the window are, in effect, filtered out of the output. The output of the discriminator, the acceptance pulse, is a TTL signal occurring essentially at the time at which the spike voltage satisfies the temporal and amplitude criteria. (no refs.)

104138 SELAVCO: a method to deal with trial-to-trial variability of evoked potentials. T.Gasser, J.Mocks, R.Verleger (Zentralinst. fur Seelische Gesundheit, Mannheim, Germany).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.6, p.717-23 (June 1983).
The possibility and the potential dangers of the inhomogeneity of potentials to repeated stimuli have been recognized for some time. The predominant method of averaging sweeps of brain activity time locked to the stimuli relies on the assumption of an invariant response. In this paper, a method is proposed for dealing more effectively with the variability of single potentials than does averaging. This method operates by weighted averaging and the weights are determined from the data after suitable filtering operations. SELAVCO is validated and compared to the average for real data and in a controlled design close to reality. (16 refs.)

104139 An improved microindentation technique to measure changes in properties of arterial intima during atherogenesis. B.S.Gow, W.D.Castle, M.J.Legg (Dept. of Physiology, Univ. of Sydney, Sydney, NSW, Australia).
J. Biomech. (GB), vol.16, no.6, p.451-8 (1983).
A fully automated instrument was developed that measured the amount and time-course of indentation of arterial intima by a spherical tipped probe 25 μm in diameter loaded routinely by forces of 10 μN. The relationship of depth of indentation to time was non-exponential but reached an apparent asymptotic value in about 6 s. Routine indentations were recorded 10 s after loading, the relationship of indentation and force being essentially linear between 0-100 μN. The instrument is an order of magnitude more sensitive than one previously described (Gow and Vaishnav, J. Appl. Physiol., vol.38, p.344-50, 1975) and produces indentations of 1-4 μm in the intima of rabbit thoracic aorta with a reproducibility of 1-2%. Preliminary usage of the new microindentor has shown increases in the compliance of the thoracic aorta intima in rabbits during cholesterol feeding. (13 refs.)

104140 The accuracy of formant frequency measurements: a comparison of spectrographic analysis and linear prediction. R.B.Monsen, A.M.Engebretson (Central Inst. for the Deaf, St. Louis, MO, USA).
J. Speech & Hear. Res. (USA), vol.26, no.1, p.89-97 (March 1983).
The accuracy of spectrographic techniques and of linear prediction analysis in measuring formant frequencies is compared. The first three formant frequencies of 90 synthetic speech tokens were measured by three experienced spectrographic readers and by linear prediction analysis. For fundamental frequencies between 100 and 300 Hz, both methods are accurate to within approximately ±60 Hz for both first and second formants. The third formant can be measured with the same degree of accuracy by linear prediction, but only to within ±110 Hz by spectrographic means. The accuracy of both methods decreases greatly when fundamental frequency is 350 Hz or greater. These limits of measurement appear to be within the range of the difference limens for formant frequencies. (25 refs.)

104141 Effects of practice and instructional set on the measurement of lingual vibrotactile thresholds. D.Fucci, L.H.Small, L.Petrosino (Ohio Univ., Athens, OH, USA).
J. Speech & Hear. Res. (USA), vol.26, no.2, p.289-93 (June 1983).
The effects on lingual vibrotactile thresholds of three different instructional sets and three different practice conditions were determined for 30 normal adult subjects. Results showed no measurable differences between thresholds obtained with the use of the three different instructional sets, but a high false alarm rate occurred for all conditions. When a subject was given practice at obtaining thresholds with a particular instructional set as a prerequisite to threshold data collection, false alarm responses disappeared. Lower (more sensitive) thresholds also were achieved when the practice condition used required the subject to provide three thresholds within 1 μ of each other before commencing with actual testing. (11 refs.)

104142 Electron microscopy of frozen hydrated sections of vitreous ice and vitrified biological samples. A.W.McDowall, J.-J.Chang, R.Freeman, J.Lepault, C.A.Walter, J.Dubochet (European Molecular Biology Lab., Heidelberg, Germany).
J. Microsc. (GB), vol.131, pt.1, p.1-9 (July 1983).
The preparation and high resolution observation of frozen hydrated thin sections has been studied by transmission electron microscopy (TEM and STEM) on model systems, including pure water, protein solutions, catalase crystals, myelin sheath and various tissues. The state of the ice is determined by electron diffraction. Mass measurement in the electron microscope is used to determine section thickness and control hydration. An adequate depth of vitrified material for sectioning can be obtained from many biological suspensions or untreated tissues. Frozen hydrated sections around 100 nm thick can be produced under optimal conditions from vitreous ice or from vitrified biological samples. Sectioning, transfer and observation in the electron microscope is feasible without alteration of the sample hydration or its initial vitrification. Biological structures can be preserved and observed down to 10 nm. Under favourable working conditions, specimen compression during sectioning and electron beam damage are the factors limiting high resolution observations. (31 refs.)

104143 Optimizing the cooling block for the quick freeze method. W.B.Bald (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
J. Microsc. (GB), vol.131, pt.1, p.11-23 (July 1983).
It is important for future ultrastructural preservation studies to freeze biological specimens as rapidly as possible. Finite element numerical techniques has been used to compare different cooling block materials used in the quick freeze 'slamming' method. It is concluded that a pure silver block at an optimum initial temperature of about 15.6K will produce the quickest cooling and will give rates approximately 50% higher than if the block were initially cooled to 4.2K. A copper block will produce the fastest cooling rates when the block is initially at liquid nitrogen temperature of 77.3K provided the section being studied is taken no more than about 30 μm from the specimen-block interface. Composite metal blocks can further reduce the total specimen cooling time compared to a mono-block at the same initial temperature but the cooling rate near the interface will be slower. Future methods for specifying cooling rates within thin biological samples should be standardized and must be based on a combination of finite element numerical analysis and the measured temperature at the rear surface of the sample. Thermal contact resistance between cooling block and specimen and between specimen and the rear face temperature sensor must be minimal. (17 refs.)

104144 Correlative light, electron, and ion microscopy on a sngle histologic section. K.G.Kupke, J.P.Pickett, P.Ingram (Dept. of Pathology, Duke Univ., Durham, NC, USA), D.P.Griffis, R.W.Linton, J.D.Shelburne.
J. Microsc. (GB), vol.131, pt.1, p.RP1-2 (July 1983).
